NEW YORK, THURSDAY, JULY 6, 1882.

The Week.

GUITEAU was executed at the appointed time, apparently without verifying any of the predictions made about his behavior at the last moment. He neither wholly preserved his firmness nor wholly lost it. He has undoubtedly displayed a good deal of nerve throughout, but not more than hundreds of other great criminals. He has not displayed, either in the jail or on the scaffold, any marked symptom of insanity, except by occasionally producing and urging "the inspiration theory" of his crime, and his confidence in this might easily have been feigned. That he was a remarkable criminal there is no doubt; but more than this he apparently was not. He has for the last twelve months, however, been a most unwholesome and scandalous spectacle, and it must long be a cause of shame and regret that the sentence could not have been executed nine months ago.

The case has brought out two phenomena of the day very strikingly. One is the passion for notoriety, which seems to be fast becoming the disease of the modern world, and seems likely to become one of its great social forces, such as religious fanaticism was in the Middle Ages. It is not until such an event as President Garfield's assassination occurs that we get a realizing sense of the burning desire to escape from the ordinary obscurity of their lives by which tens of thousands of persons are consumed, and the lengths they are prepared to go, if need be, in absurdity, to become known or talked about. If they cannot accomplish this by any act of their own, they are only too glad to accomplish it by connecting themselves in some manner, however queer or grotesque, with some notorious person. If they cannot be as much talked about as Guiteau, they are made happy by being able to retail Guiteau's talk. If they cannot have, like him, the fame of being hanged, without the suffering and the shame, they are content to furnish a patent gallows, or make the rope, or suggest a new device in knots, or in any manner whatever be publicly mixed up with an affair about which everybody is talking, and to have the air of knowing something more about it, be it ever so little, than other people. Of course this passion is fostered by the publicity afforded by the newspapers, which, indeed, are to love of notoriety what the sun is to plants. That it will increase is very certain, and that its power as a cause of crime as well as of folly will be recognized more fully as the years go on is, we think, equally certain.

The other phenomenon the Guiteau case has brought strongly into prominence is the danger to which the labors of "experts" in drawing fine distinctions about insanity are exposing the legal responsibility of all that class of the community which is most likely to commit crime. To hear them talk about such a case, one would suppose that all criminal trials should be conducted by doctors, and that all crime should raise a presumption of the criminal's insanity, and that nothing should be sufficient to upset this presumption except proof that he has been a man of very regular life, of very clear judgment, of high integrity, of great modesty and unselfishness, of strong family affections, and of great pluck and persistence. If he is dissolute, he is insane; if his opinions are foolish or weak, he is insane; if he is sharp and unscrupulous, he is insane; if he is conceited and selfish, unkind to his wife and children, fickle of purpose, and unsuccessful in his calling, he is insane. If, in short, he belongs to the class which in all ages has committed nine hundred and ninety-nine thousandths of the acts which put the existence of society in peril and make courts and police necessary, he is insane, and we must either let him go free, or shut him up in some such way as not to alarm or shock the tribe to which he belongs. According to the experts, in fact, the penal justice of society should exist only for the occasional lapses of the class to which it owes nearly everything of value in it—the steady, sober-minded, upright, industrious, and successful.

There was unusually, perhaps unprecedentedly, little celebration of the Fourth of July in the way of public speaking. For this the decline of the oration is not altogether responsible. The past year has been too much filled with the Garfield tragedy and its consequences to leave much disposition for jubilation on the part of either speakers or audiences. The only two addresses for the occasion which the newspapers in this part of the country have thought worth reporting are, a memorial discourse on Garfield, at Williams College, by Dr. Hopkins, and one of Senator Miller's, at Woodstock, Conn., in which he made the spoils system his principal text. Civil-service reform has now, in fact, secured almost as high a position among the themes for sermons, lay and clerical, on political anniversaries, as slavery had secured before the outbreak of the Rebellion. It is, in other words, recognized as one of the first things to be taken up on those days which Americans alone of all people in the world seem to set apart for meditation on the future of their country—for this is really the use to which most of the great national fête days are now put by the thoughtful part of the population. Nothing like the American speculation about the coming possibilities is to be found elsewhere, since there is nowhere else that deep and growing sense of the momentousness—in one sense or another—of to-morrow. All the old countries have settled down into a not wholly uncomfortable belief that things will be one hundred years hence very much what they are to-day, with the addition of a few millions at most to the population. But we are constantly preparing in imagination for tens of millions coming from we know not where, and seeking we know not what; and for great cities of which the site has not yet been selected; and for forms of thought of which the biggest libraries contain hardly the faintest foreshadowing.

The first of July having passed without any approach to a settlement of the difficulties between the railroad companies and the striking freight-handlers, there is ground for supposing that these difficulties had no relation to the advance of freight rates announced to take effect at that date. The railway officials declared at the outset that they were contending for a principle. They said that they would not yield to a combination of employees who knocked off work without notice, and without having even stated their grievances or asked for an advance of wages. Here undoubtedly the freight-handlers put themselves in the wrong. Their duty and their interest would have been equally consulted by first making a request for an advance and giving some days' notice of their intention to insist upon it. Such a request, fortified as it might have been by evidence showing that the rate of wages paid was inadequate as gauged by the cost of living, would have carried a great deal of weight. Public sympathy has been with the strikers notwithstanding their unjustifiable manner of making their wants known. This sympathy would have been shown much more decidedly if the initial steps in the proceeding had been more civil and considerate. The question would then have been one of a fair day's wages for a fair day's work. It is now something different from that, so the railroad men tell us, and the facts certainly give them the opportunity to say so. Probably the judicial proceedings instituted last week, and which will come up for hearing to-morrow, will throw some further light upon this phase of the case, and help to the forming of a more impartial judgment than has been possible heretofore.

The bill passed by the House on Saturday authorizing the issue of $200,000,000 of bonds bearing interest at 2 per cent. per annum, exchangeable for the existing 3½ per cents, and possessing no other advantage than that they shall not be called in while any of the 3½ per cents are outstanding, seems to be taken seriously by the newspaper correspondents at Washington, as well as by the Congressmen who urged its passage. Of course, no harm can come from the enactment of such a measure, unless it shall have the effect to interpose some obstacle to the passage of the Bank Charter Extension Bill, which contains a provision for the issue of 3 per cent. bonds on substantially the same terms as the proposed 2 per cents. English 3 per cent. consols, though having an indefinitely long period to run are below par at the present time. The chance of floating at par a 2 per cent. loan, redeemable three or four years hence, in this country would seem, therefore, to be very slight, unless coupled with a provision to repeal the tax of 1 per cent. on national-bank note circula-

tion. There would be no economy in such a swop, taking into account the expense of making it—that is, the printing and handling of the bonds. Moreover, it is not probable that Congress could be induced to repeal the tax on circulation, which, indeed, ought not to be repealed. The two per cent. refunding bill, if it becomes a law, is likely to remain a dead letter.

Mr. Hewitt's exposure of the Naval Appropriation Bill on Thursday is not pleasant reading for any American who remembers what the Navy has been in the past, and reflects upon the causes which have led to its ruin. On June 8 Mr. Robeson, in the course of a speech on the Navy, fervently exclaimed, "Thank God, every ship that now bears the flag of America and carries its guns was built by me, or was substantially repaired under my direction, and I am responsible for it." Mr. Hewitt accordingly went through this navy, the responsibility for which Mr. Robeson claims, ship by ship, giving the details of their cost, performance, and present value compared with vessels of the same size and class in the navies of other great powers. The facts as given by him show a shocking condition of affairs. Six vessels built by Mr. Robeson are alleged to have cost four times what similar merchant vessels at the time of their construction were actually built for, and, notwithstanding this, twenty-six per cent. of their first cost had to be spent for repairs in the first six years of their service. The highest average speed of these six vessels is ten and three-quarter knots, which is between two and three knots less than the speed of similar ships in foreign navies, while the consumption of coal per horse-power is three-quarters of a pound more. This is the way in which Mr. Robeson built vessels. To show how he repaired them, Mr. Hewitt took up the history of the *Tennessee*, the *Kearsarge*, and the *Pensacola*. The *Tennessee* was repaired to the extent of $1,740,000 in money, besides an old engine (cost $764,000), which was given to Mr. John Roach in part payment. The new engines have been repaired to the extent of $126,000. Ten knots, however, is all that can be got out of her. The *Kearsarge* was "substantially repaired" by Mr. Robeson to the extent of $667,000, or double her first cost, and since he stopped, repairs to the extent of $242,000 more have been found to be necessary. Still, her speed is only that of a slow freight steamer, while her engines consume three times the coal they ought. In repairing the *Pensacola* Mr. Robeson spent $1,238,800, and since he left the Department $316,800 have been paid out in addition. She is 900 tons smaller than the *Trenton*, and her speed is only nine knots.

To this array of facts Mr. Robeson hardly made an attempt to reply. He had the audacity, indeed, to assert that "if we had had the *Monadnock* finished last summer, she could have been floated into the harbor of Callao; she could have been on the coast of Peru, and a sister Republic need not have been dismembered for the purpose of filling the pockets of English dealers and contractors"; and caused some amusement by the announcement: "What I have been in character and principle I am, and what I am I expect to continue to be." He relies, evidently, on the lateness of the session, and the fact that it is difficult to separate the appropriations which he asks for from the general clauses of the Naval Bill, to carry them all through together, and thus secure the completion of the monitors, which he has so much at heart, and with regard to which, as Mr. Hewitt pointed out on Thursday, "every new board or expert directed to examine them finds grave defects in the various designs, that must be corrected at the expense of the Government and for the benefit of the contractors." The apparent blindness of the Republicans to the fact that they cannot pass such a bill, and shirk the responsibility which it entails, is very curious. Mr. Robeson and his performances with the Navy furnish the Democrats with what, considered by itself, is a very powerful argument. What can be expected, they say, of a party which not only rewards a Secretary of the Navy like Mr. Robeson by sending him to Congress, but actually puts him, after his maladministration has practically ruined the Navy, in charge of all the naval legislation? The party explanation that it is owing to Keifer, or owing to Cameron, does not help matters, for the causes which put Mr. Robeson where he is are themselves part of the burden to be shouldered. It would be hard to point out a clearer case in politics for immediate "unloading" before it is too late.

The trouble in the Star-route trial about the petitions on the strength of which expedition was ordered by Brady has been settled, and they are to go in as part of the Government's case. This must be because the Government proposes, after putting them in, to show that they were got up by Brady and his confederates in order that expedition might be ordered, for corrupt purposes, on the strength of them. In this view they are undoubtedly part of the Government's case, and how Judge Wylie got any other idea it is difficult to understand. He seems to have imagined that the prosecution, in putting in these papers, was making out a defence. Such conduct on the part of lawyers of the standing of Mr. Bliss could only be explained on the theory of collusion, which our esteemed contemporary, the *Sun*, suggests is the true theory of the proceedings from the first. But the trouble with this is, that the prosecution seems to be doing exactly what it should have been expected to do.

Some correspondence has passed between the counsel of the Civil-Service Reform League and the Attorney-General on the subject of Mr. Hubbell's blackmailing circular. Messrs. Wheeler and Whitridge call Mr. Brewster's attention to the fact that the Revised Statutes prohibit such contributions as Mr. Hubbell demands, when made by officers or employees to "any other officer" of the Government, and say that the term "officer" must include members of Congress, as is shown not only by common usage, but by the employment of the same term in the Test-Oath Act and the act of 1874 "repealing the increase of salaries of members of Congress and other officers." They also call the Attorney-General's attention to Mr. Hubbell's statement, which they refer to as "significant," and which they might fairly have called astounding, that the Committee is "authorized to state" that contributions "will not be objected to in any official quarter." Such an assurance, they point out, "appended to an invitation to commit a misdemeanor," would under any circumstances be indefensible, but, coming from members of Congress, "is a reflection upon the integrity of the Administration." They request the Attorney-General to bring Mr. Hubbell's raid to an end, by instructing the District Attorneys throughout the country to indict all offenders against the statute. The Attorney-General, in reply, promises to look into the matter and take such action as the circumstances may in his judgment require. No very profound examination, however, is requisite. His duty is a plain one. There is the statute, and it must be enforced. The defence that it is unconstitutional, because it prevents voluntary payments, is a matter for the courts to pass upon, and one with which he has nothing to do. As a matter of fact he knows, as everybody does, that the payments are not voluntary.

The Maine Republicans are the only ones who have recently shirked all mention of civil-service reform in their platform—a pitch of audacity to which, in fact, neither party has now for many years often risen. As if to show that the omission was intentional and deliberate, one of the Senators from the State, Mr. Frye, has been eulogizing Mr. William E. Chandler as a statesman, and another, Mr. Hale, has been defending the blackmailing assessment circular, which, indeed, he signed himself. Taken altogether, this amounts to a real political debauch. The Maine Democrats were not so bold or so depraved, for they denounced the spoils system in the customary terms, and now come the Vermont Democrats and follow their example. They "denounce" the political assessments, Republican hypocrisy, the Star-route conspirators, moneyed power, and monopolies, and "favor" a tariff for revenue, a reform in the civil service, strict economy, the fostering of all sorts of interests, a gold and silver currency, "or its equivalent." In fact, any one who dissented from any of the sentiments of the platform would *ipso facto* confess himself a bad man. This, indeed, may now be said of the platforms on both sides. For three or four years back, it has been almost impossible for an honest and intelligent man to gainsay anything they contain, except the charges they bring against the opposite party. If they were inscribed on brass tablets, like the public documents of Greece and Rome, and were brought to light two or three thousand years hence by the excavators of some new civilization, what an exalted idea they would give of the political morality of the American people. There is only one drawback in the mention they all make of civil-service reform, and that is, they do not describe the precise means by which they would secure the purity and efficiency they so much desire. Perhaps this will come by and by.

The "dungeon" question came up again in the House on June 28 in the shape of two resolutions reported from the Committee on Foreign Affairs, one calling for diplomatic correspondence on the subject, and for information as to whether any United States officer had made a proposition to American citizens in British dungeons to accept their release on conditions; and the other requesting the President to demand the release of the American citizens who still remain in such dungeons, and, if need be, to effect it by such means as he should deem proper, or in other words, authorizing him to declare war. The most curious feature about these periodic recurrences of the dungeon trouble is that the names of the American citizens imprisoned therein are never given. For months these remarkable men have been kept out of sight of an enraged and sympathetic public, doubtless to gratify their natural shrinking from notoriety. Mr. W. E. Robinson of course took part in the discussion, but was suppressed by the previous question, and announced that he would move for Mr. Lowell's impeachment in order to get a full hearing, but, we believe, has since reconsidered this and will let Lowell run for the present. The remarks he did make were as usual far more interesting to "experts" than to the politician. In fact, to our minds, Dr. Beard ought to find Mr. Robinson a much more instructive case than Guiteau.

The Peruvian-guano trouble has entered on a new phase. Messrs. Dreyfus, of Paris—who were really the famous Crédit Industriel—protest by advertisement against the proposed sale of 1,000,000 tons of guano by the Chilian Government, on the ground that they (the Messrs. Dreyfus) bought 2,000,000 tons of guano from the Peruvian Government in 1869, with the right to take them out of any deposits they pleased, which they have not yet done. They accordingly protest all round and to the Chilian Government through the French Minister. The French Minister is undoubtedly the proper medium for their protest, and not the American Minister; and if there is to be a fight over this guano, the proper parties to it are France and Chili, and not the United States, Great Britain, and Chili, as some diplomatists, whom we shall not name, would have preferred.

The Conference at Constantinople seems somehow to make little progress toward a decision. The Porte will not have anything to do with the deliberations, and it is unlikely, therefore, that it will be charged with the duty of suppressing Arabi Bey. The only thing certain in the whole matter is that England is getting ready to act alone. Thus far France does not seem to object to her doing so, and, in fact, nobody does. The immense importance to her of the Suez Canal is acknowledged on all hands as a reason why she should not stand idle, whatever others may say or do. Arabi could, in fact, block the Canal in a single night, thus cutting off England from military communication with India by the short route, and greatly impeding her commerce, for three-fourths of the vessels which pass through it carry the British flag. We shall, therefore, probably speedily witness British intervention, to be followed or not by the approval of the Conference, and supported or not by a French contingent.

The French Ministry are apparently afraid of the responsibility, and are disposed to take the ground that it is no business of theirs whether Arabi or Tewfik gets the upper hand. In other words, they know that England must move for the protection of the Canal, whatever France may do, and they rely on the moderation and peaceableness of the Gladstone Ministry to prevent the occupation from becoming permanent. But behind all this there is undoubtedly the timidity inspired by the condition of the army as revealed by the Tunisian expedition. This nipped the reviving martial enthusiasm of the French in the very bud. The truth is, that the new military organization appears to be, for the purposes of small expeditions, a complete failure. In the last war the army was found unfit for operations on a great scale. It was then reorganized on a plan in which nothing but great operations was thought of, so that when the expedition against Tunis was set on foot, there was no small unit to be found for it, and whole corps had to be pulled to pieces to furnish an army of 30,000 men, horse, foot, and artillery. Since then there has been complete dismay in military circles, and no stomach for fighting anywhere. But then it must be said, too, that the Ministry are afraid of the Chambers, for the very good reason that they do not know what the mind of the majority is or is likely to be about anything.

The Davitt land-nationalization scheme has been repudiated with a good deal of emphasis by the leading Parnellites. Healy, in particular, who is in many ways the ablest of them, and who but for his violence would be the most influential, has been interviewed by the *Herald* correspondent, and states very forcibly and tersely the leading objections to it from the Irish point of view—such as its failure to better the condition of the peasantry in Egypt and India, the probability that it would lay the farmers at the mercy of politicians and fill them with anxiety about the amount of their rent, in the form of taxes, at every election, and its total unsuitability to the now prevailing Irish ideas about land. It is difficult, indeed, everything considered, to account for its getting into Davitt's head, except by the supposition that his hatred of the landlords is with him a mastering passion, and that any scheme which promises their total disappearance finds an easy lodgment in his brain.

The trouble in the House of Commons, which has resulted in the withdrawal of the majority of the Parnellites, is one in which the Government has undoubtedly at last put itself at least as much in the wrong as the Irish. The Irish were filibustering in the Committee of the Whole, and had divided themselves into relays for keeping up the work at night. Dr. Lyon Playfair, the Chairman of the Committee, determined to stop the obstruction by suspending the relay as soon as it came on the ground, and for this purpose procured a list of its members, and then committed the extraordinary blunder of suspending everybody whose name was on the list, without ascertaining whether he had been actually present and guilty of obstruction or not. Four were thus suspended who were not guilty of obstruction at all, but were at home in bed when the penalty was inflicted. Mr. O'Donnell was one of these, and, the next day, when he ascertained the fact, he came into the House, and denounced the Chairman in unmeasured language. Mr. Parnell, though present, was also guiltless of any actual obstruction, and was suspended simply as a member of the obstructing force. It was at first supposed that Dr. Lyon Playfair had received his instructions from the Ministry, and that the whole affair had been got up by Sir William Harcourt, who had on Saturday morning plainly played the part of a provoker of Irish turbulence. But Dr. Playfair denies this, and says it was all done on his own responsibility. The result was, however, that some sixteen Irish members, who really represent a larger proportion of the Irish people than all the rest of the House put together, were summarily got rid of by this high-handed process, and in their absence the remaining clauses of the bill were rushed through the Committee. O'Donnell's case was then dealt with, and, as he refused to retract or apologize, he was suspended for fourteen days.

If the sole object of the Ministry were to pass the bill, it might be possible to excuse such a high-handed measure as the infliction of penalties on members of the House by categories, and not by individuals, though the like of it has never been heard of in civil justice before, to say nothing of parliamentary procedure. It is only in the army that individuals are sometimes made to atone for the offences of the body to which they belong. But the object of the Ministry is not simply to pass the bill. Its object is to secure the punishment of crime and to diffuse popular respect for the law in Ireland. Nothing better calculated to prevent these things, and to deprive the law of all moral weight, could well have been devised than these proceedings. This unfortunate effect has been emphasized by the withdrawal of the Parnellites in a body, followed by loud cheers from the rest of the House. It is easy to foresee what the effect of these cheers in Ireland will be. Unless all signs fail the present Parliament cannot last very long, and at the next general election it is all but certain that seventy Parnellites instead of twenty-three will be sent to the House of Commons from Ireland. In short, Mr. Gladstone has got his bill passed, but it is a bill in the promotion of which we greatly fear he was catering for the support of his Whig followers, rather than following his own best judgment, and has armed himself with a weapon which will not restore order in Ireland, and will react with fatal effect on his Ministry. The telegraphic account of the form in which the bill has finally passed the Committee is very, and inexcusably, obscure. Its most importan feature was the substitution of trial by three judges for trial by jury, and it is over this that the fiercest fight was made. It seems—though it is not perfectly clear—that this has been abandoned, and that all trials under the act are to take place before a special or struck jury.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, June 28, to TUESDAY, July 4, 1882, inclusive.]

DOMESTIC.

GUITEAU, the assassin of President Garfield, was hanged in the corridor of the United States Jail, at Washington, on Friday. Every opportunity, under the laws, for his reprieve or pardon had been tried and exhausted by his counsel, Mr. Charles Reed. On Thursday Mr. Reed had an interview with his client, and informed him that he had no reason for hope. Guiteau coolly accepted the situation, and wrote a will, giving the disposal of his body after death, and the copyright of his book, 'The Truth and the Removal,' to the Rev. Dr. William W. Hicks, his spiritual adviser. He also directed that if a monument were ever erected over his grave, it should bear the inscription, "Here lies the body of Charles Guiteau, patriot and Christian. His soul is in glory." The criminal's last night was passed restlessly. Friday morning he spent in arranging the details for the last scenes of the tragedy. He wrote some verses and a prayer to be read on the scaffold, and conversed with Dr. Hicks on religious subjects. As the morning advanced he succumbed to nervous excitement, and wept for a time. When, however, the death warrant was read at noon, he listened to it without visible emotion. About 250 spectators were drawn up on both sides of the long corridor, at the end of which stood the scaffold. After a prayer for mercy by Dr. Hicks, Guiteau unfalteringly read a passage from the New Testament (Matt. x. 28-41), and, as a last dying prayer, a solemn avowal of the Divine origin of his crime, coupled with spiteful maledictions against the press, the President, the Government, and the nation. This was followed by his repeating some verses, intended to indicate his feelings at the moment of leaving the world, written to imitate the prattle of a child. He wept while he read. Dr. Hicks pronounced a benediction; the noose and black cap were adjusted; Guiteau shouted, "Glory, glory, glory!" and dropped a bit of white paper as a signal to the executioner; the trap fell at 12:40, and in fifteen minutes he was dead, from strangulation. An autopsy was performed by competent physicians in the afternoon. The brain and vital organs were found in a healthy condition, but the membrane which envelopes the brain was found to be diseased.

John W. Guiteau, the assassin's brother, was present at the execution. Mrs. Scoville, his sister, was not admitted, but she sent flowers for his coffin.

On Saturday afternoon, at four o'clock, the body was buried in a grave dug in the northeast corridor of the jail. Six convicts bore the coffin thither. Dr. Hicks and John W. Guiteau were present, with several jail officials.

The House of Representatives spent several days last week in discussing the Naval Appropriation Bill. Mr. Robeson's plan to complete the monitors was strongly opposed by Mr. Hewitt. In the Senate a bill has been introduced providing for the appropriation of $10,000,000 for building new cruisers. An amendment, which practically abolishes the rank of commodore after July 1, 1883, was passed on Saturday. The number of lieutenants on the active list is to be limited to 200.

In a discussion on a resolution in regard to the American "suspects" question, Representative Robinson, of New York, on Wednesday, made a violent speech, in which he gave notice that he would move at an early date to impeach the Minister of the United States at London. On the following day he changed his mind, and concluded to leave the question to the care of the Foreign Affairs Committee.

Representative Hawk, a Republican, representing the Fifth Illinois district in Congress, died in Washington on Thursday, after an illness of ten days. Both branches of Congress adjourned, out of respect to his memory, on Friday.

President Arthur has vetoed the Deuster Steamship Bill for regulating the carriage of passengers at sea. The reason he assigned was that the practical result of the law would be to subject all the ocean steamers to great losses, and to restrict immigration. The President signified his willingness to give his prompt assent to a bill on the same subject correctly constructed.

The President has nominated, as the Geneva Award Commission, ex-Senator Harlan, of Iowa, Judge Wells, a member of the former Commission, and Asa French, of Massachusetts.

In Army circles, especially among the younger officers, there is great dissatisfaction with the new law retiring officers at sixty-four years of age. A movement is on foot to introduce a bill next winter to lower the limit to sixty-two years.

A Naval board has reported to Secretary Chandler, recommending that Congress appropriate $25,000 for the removal of the bodies of Lieutenant De Long and his ten comrades, of the *Jeannette*, from their resting place by the banks of the Lena, to this country.

Pension Commissioner Dudley believes that the new force which Congress has provided will enable him to settle up pending arrears cases within one year, and to dispose of the entire accumulation of applications of all kinds within three years.

The public debt was decreased, during the month of June, $12,560,696 70.

On behalf of the Civil-Service Reform Association, Messrs. Wheeler & Whitridge, of this city, their attorneys, have written a letter to the Attorney-General of the United States, calling his attention to the fact that the Revised Statutes prohibit any such contributions as are asked for in Congressman Jay A. Hubbell's recent "political-assessment" circular addressed to the employees of the Government. The letter also points out Mr. Hubbell's significant statement that such contributions "will not be objected to in any official quarter," and refers to it as "a reflection upon the integrity of the Administration." The Attorney-General is requested by the letter to give instructions to the District-Attorneys throughout the country to indict all offenders against the statute. The Attorney-General has promised to look into the matter, and take such action as his judgment may approve.

In the Star-route trials at Washington during the past week, evidence has been presented by the prosecution, in regard to a number of routes, of an uninteresting nature, dealing specially with the details of contracts. Petitions for expedition, whether their genuineness is to be attacked or not, will be admitted by the court as evidence.

The Illinois Republican State Convention met on Wednesday and nominated General J. C. Smith for State Treasurer. A resolution in favor of a prohibitory amendment to the Constitution was voted down by a vote of 623 to 133.

R. E. Pattison, of Philadelphia, was nominated for Governor by the Democratic State Convention of Pennsylvania, which met in Harrisburgh on Wednesday and Thursday. Chauncey F. Black was nominated for Lieutenant-Governor, and Mortimer V. Elliott, of Tioga County, for Congressman-at-large. The platform contains a protest against the spoils system of politics and the boss-rule of party. The ticket is considered a strong one, and likely to succeed unless some energetic measures are taken to unite the Republican party.

The Vermont Democrats have nominated George E. Eaton, of Danville, for Governor. The Michigan Prohibitionists have nominated Daniel P. Sagendorph for Governor. Their platform demands the ballot for women in addition to its prohibition "plank."

A prohibition amendment to the Iowa Constitution was approved at a special election on June 27, by a majority of more than 26,000.

The bondholders' proposition to settle the State debt of Louisiana has passed both branches of the Legislature with slight amendment, and is now before the Governor for his approval.

Governor Cornell has vetoed the bill to provide for the construction, maintenance, and operation of street-railroads in cities, villages, and towns. This is the bill known as the Surface Railroad Bill. He has also vetoed the Field Civil Code and the Sharpe Receivership Bill.

Crop reports from all parts of the West continue favorable, with the exception of those referring to the corn prospects. The violent storms, heavy rains, and chinch bugs threaten to cut down the yield.

A great storm of wind and rain passed over Ohio, Indiana, Illinois, and Iowa on Friday, doing great damage to property.

The blockade in the freight traffic of this city, owing to the strike of freight-handlers, has continued. New men have been engaged by the railroad companies, but they have been incompetent to manage the work. It is possible that the old hands will soon be reëngaged at the rates which they demand.

Of the five thousand miners in the Clearfield, Pa., coal region, not more than 250 are now at work. They refuse to resume operations until an advance of thirty per cent. is made in their wages.

The express train which left Long Branch at 8:05 o'clock on Thursday morning, while crossing the bridge of the Jersey Central Railroad, over Parker's Creek, an arm of the Shrewsbury River, near Little Silver station, left the track, by reason of the spreading of the rails, and four passenger coaches and the smoking-car went over into the water. The cars were filled with passengers, mostly cottagers at Long Branch, Elberon, and Asbury Park. There were many prominent citizens on the train. General Grant was in the smoking-car. He was in the water, breast high, but was drawn out through the car window, only slightly bruised on one leg, and still calmly smoking his cigar. S. L. Bradley, a contractor and builder of this city, was killed outright, and George W. Demarest, a wealthy produce merchant, C. M. Woodruff, President of the Newark Fire Insurance Company, and James E. Mallory, a real-estate broker, died soon after the accident. Eight persons were seriously and about fifty slightly wounded. Among the seriously injured was W. R. Garrison, son of Commodore Garrison. He died on Saturday, at the age of forty-seven. Early in life he became connected with various railroad and steamship enterprises. He was identified with the elevated-railway system of this city, and was President, at one time, of the Metropolitan and Manhattan.

Henry C. Cole, a Cincinnati lawyer of some ability, killed his wife and daughter on Wednesday, and then committed suicide. He belonged to a wealthy and highly respected family. Financial troubles caused the deed. His daughter was twenty years of age, and very intelligent.

The trial of the Malleys and Blanche Douglass for the murder of Jennie Cramer was concluded at New Haven on Friday by the jury, after an hour's deliberation, bringing in a verdict of not guilty as to all the persons indicted. The charge of the judge was considered favorable to the accused.

The annual Commencement exercises took place last week at Harvard, Yale, Amherst, Union, Lafayette, Dartmouth, and Hamilton Colleges. At Harvard College Mr. Carl Schurz delivered the Phi Beta Kappa oration, his subject being "Education in the Republic." At Union College the anti-Potter faction of the faculty met the Board of Trustees on Wednesday, and a resolution was passed adjourning until July 10, when the faculty are

to bring specific charges against the President, which will be thoroughly investigated. At Yale College Chief-Justice Morrison R. Waite was elected a member of the Corporation. At Dartmouth Senator Bayard, of Delaware, delivered an oration on the life and services of Daniel Webster.

The annual boat-race between the eights of Harvard and Yale Colleges took place at New London, Conn., on Thursday, and was won by Harvard. The race was very close and exciting. At the end of three and a half miles the boats were about even, and at the finish Harvard was only about one-half a boat-length ahead. The official time was: Harvard, 20:47½; Yale, 20:52¼.

Harvard and Columbia College boat crews disagreed in regard to the time of rowing the race at New London, Conn., on Monday. No compromise could be effected, and Harvard left without rowing. Columbia pulled over the course alone on Monday afternoon.

The Columbia College Freshman crew defeated the Freshman crew of Harvard College in a two-mile race, on the Harlem River, Saturday afternoon, by three lengths. The time of the winning crew was 10:56. The crews consisted of eight oarsmen and a coxswain.

The University of Pennsylvania won the race in the Inter-Collegiate Regatta on Lake George, Tuesday afternoon. The other colleges taking part were Wesleyan, Cornell, Princeton, and Bowdoin.

Yale College won the College Championship at base-ball by its final game with Amherst on Thursday. Princeton has the second place.

Miss Annie Louise Cary was married on Thursday, in Portland, Me., to Mr. C. M. Raymond, of New York.

FOREIGN.

The bill for the repression of crime in Ireland was still further considered by the House of Commons, in committee, during the week. On Wednesday afternoon clause 15 was adopted. Clause 16, as to the power of the Lord Lieutenant relative to the compensation to be paid in certain cases of murder and maiming, was passed on Thursday. The discussion of the seventeenth clause, which defines the expression "district," and prescribes the methods of apportionment and collection of constabulary and compensation charges therein, was begun on Friday evening. The Parnellites then resorted to their old methods of obstruction. An all-night session ensued. Mr. Parnell said that no opposition could be more reasonably conducted against such an atrocious measure. At 9:30 o'clock on Saturday morning, Dr. Lyon Playfair, Chairman of the Committee, said there had been deliberately planned obstruction to the business of the House. Sixteen Home Rulers were then suspended and quitted the House, Mr. O'Donnell declaring that Dr. Playfair's naming him was infamous, because he had been absent from the House all night. Other suspended members claimed that they had not spoken. Clause 17 was finally adopted about 2 o'clock P.M. on Saturday. Clauses 18 and 20 were then adopted, clause 19 being dropped to be replaced by an amended article. About 6 o'clock on Saturday evening, the Parnellites again began their dilatory motions. The Chairman named eight of them, and their suspension was moved by Mr. Gladstone, and carried. After the expulsion of this second group, all the remaining clauses of the bill were adopted, including the clause which continues the bill in force for three years. The House then adjourned.

In the House of Commons on Monday afternoon, the Speaker said the Irish members could only raise the question of the suspensions on Saturday by an ordinary motion, and not as a question of privilege. He approved the action of Dr. Playfair in reporting Mr. O'Donnell. That gentleman refused to make any explanation as to his conduct, and Mr. Gladstone moved his suspension for a fortnight. Mr. O'Donnell then denied that he had used the word "infamous," but admitted that otherwise he had spoken as alleged. He tried to prove that he had not obstructed the business of the House. After a long discussion, and the rejection of an amendment to drop the affair, Mr. Gladstone's motion was carried by a vote of 181 to 33.

Urgency was voted for the Repression Bill on Monday by 259 to 31.

Mr. Blake, the agent of Lord Clanricarde, and Mr. Keene, his steward, were shot and killed when riding on a car near Loughrea, Ireland, on Thursday. No arrests have yet been made.

There are rumors of a plot that has been discovered to assassinate Cardinal McCabe.

A meeting of Conservatives was held in London on Thursday, at which the Egyptian policy of the Government was discussed. Lord Salisbury made a speech in which he pointed out that the Government had suffered their demands to be disregarded, and he declared that, unless they removed Arabi Pasha, their whole position in the East would be jeopardized.

This has been a week of preparation and negotiation in Egyptian affairs. While the Conference was slowly carrying on its secret sessions at Constantinople, in vain endeavoring to gain the Porte as a party to its deliberations, England was preparing actively to guard her interests. Preparations have been made at Woolwich by which 40,000 men can be embarked on the instant. The Paris *Journal des Débats* concedes Great Britain's right to act alone, as the Suez Canal question is one of vital importance to her. It is said that Bismarck is on the side of England as regards the Suez Canal.

Arabi Pasha addressed his troops at the Arsenal in Alexandria on Thursday. He said that invasion had often been threatened by Europe, but had come to nothing. Their eyes were opened now, and it was not of England alone they were going to be afraid. The tone of the Army at the meeting was not very reassuring, however.

Arabi Pasha is alarmed at the general emigration of the Europeans, and proposes to confiscate their property.

Dervish Pasha has issued a proclamation at Alexandria calling upon the people to obey the Khedive and fraternize with the Europeans. On Saturday the Porte signified its intention to be guided by the views of the Conference respecting Egypt. Turkish troops will probably be sent to establish the *status quo*, under the direction of the Powers.

Ragheb Pasha and the other Egyptian Ministers declare that they will oppose armed intervention by Turkey. One of the Ulemas has declared that such a war would be lawful. A majority of the military officers, however, have informed Arabi Pasha that they are opposed to fighting. There is a disagreement between Dervish Pasha and Arabi.

It is said that the French Cabinet has decided that France is not in honor bound to support the Khedive, if the people are persistently hostile to him and the great Powers are ready to support a candidate to be agreed upon between Arabi Pasha and the Porte.

The Bombay Government has received instructions to be prepared for the shipping of the contemplated military expedition to Egypt. The Calcutta newspapers consider that a campaign in Egypt would be hailed with the liveliest satisfaction by native Indian troops.

The Russian police have discovered the names of all persons through whom the Nihilists were in the habit of receiving funds. Among them are many prominent persons. The police have full particulars of the members of the Central Managing Committee, and also a list of members who have joined the revolutionary party since 1872. There are about 680 names on the list.

General Colbuss and M. Soboleff, both Russians, are to be appointed Ministers of War and of the Interior, of Bulgaria, respectively. The whole Bulgarian Cabinet will probably be reconstructed.

A resolution was adopted, at a meeting of a number of leading German manufacturers at Cologne, on Saturday, declaring that the bimetallic agitation is most injuriously affecting the economic interests of the country, and that the Government should express its determination to carry out a gold currency without undue haste.

The total period of service in the German Army has been reduced from fourteen to twelve years. The law will go into effect next autumn.

M. de Lesseps, the French engineer, presented a report to the shareholders, in Paris on Thursday, in which he asserted that the completion of the Panama Canal within the time he first assigned is now certain. He announced that the work already done has proved that the obstacles to the construction of the canal will not be so serious as was anticipated. The shareholders were asked to authorize the issue of obligations to the amount of £250,000 for the purchase of the Panama Railroad. They approved the report and authorized the issue of bonds.

The Spanish Chamber of Deputies has approved bills abolishing differential dues on foreign vessels in the ports of Cuba and Porto Rico, and reforming commercial relations between Spain and her colonies. The Senate, by a vote of 116 to 59, has adopted the bill reducing the customs tariff.

The treaty between the United States and Corea has been ratified through the exertions of Commodore Shufeldt, of the United States Navy. This country will have a Minister, a Consul-General, and several consuls in Corea. The treaty, after acknowledging the political independence of Corea, provides that American offenders against the law in Corea shall be tried by an American Consular Court. In matters of law between a Corean and American the case shall be tried by the court of the nation to which the defendant belongs. Corean merchants and ships visiting the United States shall pay duties, etc., on the scale of the United States customs tariff, Corea being treated like the most favored nation. The Corean Government will exact import duties not exceeding eleven per cent. on the necessaries of life and thirty per cent. on luxuries. Coreans are given permission to live and trade in the United States, but American merchants are not permitted to travel in the interior of Corea to sell any kind of foreign goods. Foreign opium is not to be imported by either nation into a port of the other. The Corean monarch can prohibit the export of rice when a famine is apprehended. Scholars of either country are to be allowed to study in the other.

The Chilian President's message to Congress has been well received in that country. It is thought to indicate a wish on his part that the occupation of Peru shall cease as soon as any government can be formed more stable than Montero's. There is a strong probability that the whole of North Peru will soon be given up by the Chilians, and a possibility that they will abandon Lima.

The Canadian revenue returns for the eleven months of the fiscal year just ended show an increase over the total receipts for the previous fiscal year, and the complete returns for 1882 will probably show a total of $32,000,000, an increase of nearly $4,000,000. On the other hand, the expenditures have been as great for the first eleven months of the fiscal year of 1882 as for the previous fiscal year.

W. H. Gilder, of the lost Arctic steamer *Rodgers*, has arrived at Irkutsk. He was delayed in his journey by the breaking up of the Russian rivers, and was obliged to kill his horse for food.

Floods in the Frazer River district of British Columbia have damaged property and crops to the amount of $400,000.

THE EXECUTION.

It is to be hoped that the very revolting scene at the scaffold on Friday will do something toward bringing about a reform in the matter of the license accorded to condemned criminals in the moments immediately preceding their execution. The sensational atmosphere with which a noted murderer is surrounded as soon as he is arrested, is bad enough. The jailer and the chaplain and the wardens and his lawyer, and sometimes his father and mother and wife and sisters and brothers, seem to join in trying to "make capital," to use a slang phrase, out of his situation. To be connected with anybody so much talked of, to know more about him than others, and be able to tell people things about him which they wish to hear, seem to constitute temptations to folly and indecency which a lamentably large portion of the community is wholly unable to resist. In Guiteau's case we have had more of it than in any other, but we have a sickening amount of it in that of every murderer of note. The prisoner is at once made a show of, and every one who can claim the slightest connection with him tries to share in the business of exhibiting him, and making him as attractive a novelty as possible. There is hardly a sheriff or jailer in the country who seems to think that he has any duty before or during the trial except to prevent his escape, or that the custody of him imposes any obligation to society and the law in the matter of decency and propriety. We are constantly denouncing, in the pulpit and in the press, the flashy, cheap literature of crime which is offered to our boys, and especially poor boys. The main objection to this literature is that it surrounds robbers and cutthroats with a halo of romance, or, in other words, makes heroes of them, converts them into persons whom the public seems to admire and be curious about, and by imitating whom a young man can achieve fame, or, what seems to a great many people the same thing, escape from the obscurity in which the great bulk of mankind are condemned to live. There is, however, hardly a prominent murderer in the United States who is not, from the moment he passes into the custody of the officers of the law, made, or allowed, to exercise the same corrupting influence on the juvenile imagination. The moral and social degradation of the man is covered over, and indeed one may say draped, by making him an object of deep interest, who receives numerous visitors and large numbers of presents, has an extensive correspondence, like a great merchant or statesman, and is pestered for his autograph as if he were one of the world's benefactors, who had in field or forum raised men's ideas of the possibilities of their race.

Prisoners before trial ought undoubtedly, under our legal theory of their condition, to be treated with all possible consideration. They ought not to be subjected to more inconvenience or discomfort than necessarily accompanies confinement in a jail; but no civilized community should allow its prisons to be converted into show places, in which persons accused of grave crimes can posture as popular heroes. Accusation of crime, of course, brings notoriety with it, but our prison regulations should be such that the prisoner should not be able to increase it by his communications with the outer world. The way Guiteau was allowed to "carry on" in jail and in the court-room during his trial, feeding the passion which had led him into his offence—the jailers, the police, the judges, the ministers, the law officers of the Government all conniving at it—was a great disgrace to our administration of criminal justice. We do not here refer to his brawling in court, which was doubtless part of his game, and difficult if not impossible to prevent; but such gratifications of his vanity as his passing hours in the court-room, under the judge's eye, writing autographs, which were actually distributed by a policeman, were scandalous in the extreme.

We were in hopes that the public disgust excited by his trial would have spared us the repetition of the same kind of scandal at his execution. But here again we have fallen victims to the spectacular theory of criminal justice held by jailers and chaplains. To many sheriffs and wardens the execution of a murderer seems to be simply the climax of a melodrama. The daily exhibitions of the prisoner, or the daily reports to the press about his sayings and doings, his feeding and drinking, his appetite, his clothes, his sneezing and snorting, his prayers and speculations, are apparently only intended to lead up to the grand final tableau on the gallows, in which the warden and the sheriff and the chaplain play as conspicuous a part as the criminal, but a much more comfortable one. Invitations for the ghastly show are issued with more gusto and care, and more sense of favor conferred, than for a banquet to the hero of a hundred fights; and the furious demand for them of course heightens the officer's sense of the social glory of the occasion. We have seen an invitation addressed by a Colorado sheriff to a gentleman and his wife, requesting "the pleasure of their company at the execution of" Bill Sykes. The general result is that a great part of the good of having executions "private" is lost. In fact, our private executions are not private. The jail is usually as full of spectators as it can hold, and they are spectators from curiosity, and not, what they ought to be, simply witnesses of the final execution of the law. Instead of numbering a dozen or two, they number hundreds. Instead of being part of the administration of justice, they are an audience torn by the same passion which filled the amphitheatre at Rome. Such an execution as took place at Washington on Friday is undoubtedly a great improvement on the old plan, still adhered to in many parts of the South and West, of hanging a criminal in the middle of a field before a large and tumultuous mob; but it is not the kind of execution which a great nation should permit at the seat of government in a modern jail.

The license given prisoners as to their talk on the scaffold is also rather a piece of the show than a piece of humanity. The thoughts of a poor wretch in this condition, after months of confinement and anxiety, and when face to face with what he most fears on earth, about either life or death or judgment, are of course worthless. They are nearly always incoherent maundering which it is an offence against humanity to allow him to utter in the presence of a curious crowd. The one thing he has a right to utter, and should be permitted to utter, is a confession or denial of his guilt. The exhibition of Friday, in which Guiteau was suffered to conduct a sort of religious service, consisting of the reading of a chapter from the Bible, a blasphemous and ruffianly and incoherent prayer, and a ridiculous poem, was disgraceful, not simply to our administration of justice, but to our civilization. Neither the Reverend Mr. Hicks nor the Warden can excuse his share in the transaction by pleading that he was taken by surprise. They knew what the criminal was going to do. His prayer was written out, and the clergyman actually held the paper and the Bible for him to read. A more deliberate indecency and profanation has not been committed in our day, and it is greatly to be regretted that those who were responsible for such a shameful scene cannot be punished for it as they deserve. If the Reverend Mr. Hicks is accountable to any ecclesiastical tribunal, it certainly ought to discipline him.

THE PROPOSED REMEDY FOR THE STRIKES.

The Attorney-General on Friday obtained from Judge Donohue an order, returnable next Friday, requiring the Central and Erie Railroads to show cause why a peremptory mandamus should not issue compelling them to exercise their franchise and handle and transport freight. The facts on which the order is based are that there has been for days a large accumulation of freight in the city, which is ready for the railroads, but which the railroads do not take. It will be at once seen that the application for a mandamus is of great importance to every railroad in the country, and to the entire business community. Strikes like that of the freight-handlers have occurred before, though not on so large a scale, and are likely to occur again with perhaps increasing frequency, as the habit of combination against employers grows.

Of the legal responsibility of the railroads to the shippers for any delay caused by the strike itself, there is not, under the decisions of the courts in this State, the slightest shadow of a doubt; and no one is probably better aware of it than the managers of the Erie Railroad, which several years since became involved in a strike closely resembling, except in magnitude, that now going on. In that instance the trouble was caused by a combination of engineers; nine-tenths of the engineers on the railroad stopped work, and of course brought its operations to a standstill. A shipper named Blackstock sued the company in the Superior Court for damages caused by the delay; the company attempted to defend the suit on the ground that the delay was produced by a cause absolutely beyond their control; that no exertion of any sort by them could have prevented it, and that, consequently, they ought not to be held liable. The Superior Court, however, which at that time was one of the ablest in the country, after a very elaborate examination of the law and facts, reached the conclusion that

the facts constituted no excuse. The late Judge Woodruff, who wrote the opinion, while admitting that the case might be one of great hardship to the railroad, held that its duty to do its work as a common carrier was imperative; that in doing this it took all the risks arising from the employment of servants and agents, and that among these was that of a strike among them; that the neglect or failure of the engineers to run the trains was in law the neglect and failure of the railroad; that the old common-law principle that nothing would excuse a carrier but "acts of God" (*i. e.*, extraordinary convulsions of nature) and the public enemy, was still the law of this State, and that our system of jurisprudence gave no ground for the suggestion that the *force majeure* of modern European law, the old *vis major* of the Civilians, would relieve the carrier of his liability The soundness of this decision, so far as we know, has never been questioned, and the matter has been generally regarded among lawyers as definitively settled ever since the Blackstock case.

But it is equally well settled all over the country, and nowhere better than by the decisions of the Court of Appeals of this State, that the carrier may limit the stringent liability imposed upon him by the law by means of modifications of the bill of lading or invoice, which constitutes the actual contract upon which all goods are transported by railroads. These decisions have, in fact, gone so far as to hold that the carrier may exempt himself by this contract from the consequences of his own (including his employees') negligence. Considering what a bill of lading is, it must be admitted that the mercantile community have good reason to criticise this sort of exemption. Though in law a contract between the shipper and the company, it is, in fact, little more than a receipt for the goods, and a promise to deliver them to the consignee, accompanied by a notice of certain terms and restrictions imposed by the company upon its own liability. It is obvious that such contracts should be watched by the courts with extreme vigilance, as the shipper in nine cases out of ten has to take the bill which the company offers. Anybody who is not accustomed to shipping goods may get a vivid idea, in a small way, of the position in which the shipper finds himself by considering his position, on arriving in New York or any other large city, with regard to baggage. He is practically compelled, if he wishes it to be carried to his home, to give it to an express company (also a common carrier), under the terms and stipulations of an express receipt (also a bill of lading) full of limitations and restrictions, from which he has no means of dissenting. A customer dealing with a railroad under such circumstances would never voluntarily accept a bill of lading exempting the road from the consequences of its own negligence. He only does it from dread of the danger of delay and loss if he does not take whatever bill the company gives him. It is much to be regretted, therefore, that the Court of Appeals of this State should have ever carried the license of exemptions in bills of lading to the point of permitting such a restriction. It has, however, been done, and the present determined attitude of the railroads is no doubt in part due to the fact that the law of bills of lading is so much in their favor.

Relying on these decisions, the Erie and Central Railroads have made the attempt to rid themselves of all liabilities caused by the freight-handlers' strike, by putting a "paster" on their bills of lading in the following form: "This company receives this property only upon express condition that it shall not be liable for delays, loss, or damage thereto, caused by or resulting from strikes, acts of violence, threats, or intimidations." Now, obviously, if this restriction were once recognized as valid by the courts, it would relieve the companies entirely of the effect of the principle laid down in the Blackstock case, and rid them of all responsibility for the effects of any such combination of employees as is now going on. It would enable them to shift upon the mercantile community all the losses arising from any dispute between themselves and the servants for whom, by the acceptance of their charter, they make themselves responsible. Whether the courts would uphold it is doubtful, but the question of its validity could not be determined except after long and expensive litigation, and meanwhile shippers would practically be compelled to waive their rights in order to get their goods transported at all.

It is in great measure to get the community out of this awkward dilemma that the application for a mandamus has been decided upon. It is the first time, we believe, in the history of railroads, at least in this State, that such an application has been made to compel a carrier to receive and forward freight. The general jurisdiction of the courts to compel corporations to perform their charter duties has long been recognized, though hitherto the application has been generally made for objects connected with the location or construction of the road rather than with its operation. In Connecticut, however, the Hartford and New Haven Railroad was compelled by a mandamus of the Supreme Court to transport passengers, and the principle as to freight and passengers is of course the same. The great advantage of the remedy by mandamus is that it is a summary process, and that the order of the court is enforceable by contempt proceedings. The great extent to which the exemption of carriers from their common-law liabilities as insurers of goods has been carried by the courts of this State makes the application of the Attorney-General one of unusual interest, both in its mercantile and legal aspects. The companies may of course undertake to meet the application by insisting that they are ready to receive and transport freight upon bills of lading containing restrictions as to strikes; but no court has ever held that such restrictions can be imposed upon the shipper against his will; and, if he refused the bill, the Supreme Court would practically have to decide in mandamus proceedings whether it would compel the companies to take freight without any restrictions of any kind. The theory of law being that the bill is a voluntary contract, and the restrictions all matters of agreement, it is hard to see how, admitting the right to mandamus, the court would have any alternative but to compel the company to transport as a common carrier, with all the liabilities of an insurer. It cannot make a bill of lading of its own, or determine what are reasonable restrictions to be inserted in it, if the shipper insists that he will submit to none at all. In view of all this, it is highly probable that the railroads will find the right of mandamus a remedy which will do much to restore the shipper to the position of advantage of which the decisions of our courts as to bills of lading have in great measure deprived him.

THE CHEERFULNESS OF THE MONO-METALLISTS.

The negotiations for the establishment of universal bi-metallism have ended in a somewhat mysterious manner, for we believe the Conference was adjourned to the 10th or 12th of April last, and neither met on that day nor was adjourned to any other. In fact, in the absence of a meeting, nobody had any authority to adjourn it. There is no committee or other permanent organization to look after procedure. Consequently, if nobody came to the Conference on the appointed day, it, *ipso facto*, disappeared. And this, we think, is what happened. There was on the appointed day nobody to confer, and, therefore, there was no Conference, and no further adjournment. The movement for an international agreement is, therefore, not simply suspended: it has, for the present at least, ceased to exist. Some of its promoters maintain, however, we suppose on the principle that the darkest hour is just before the dawn, that the bi-metallic cause never looked more hopeful than at this very moment. What they base this assertion on, however, they do not reveal, except by pointing to some new convert to their theory among prominent business men in some monometallic country.

An occasional conversion of a merchant or banker fond of writing about finance—and the converts nearly always belong to this class—will never carry the day for them. Nothing will carry the day for them, and impose on staid and conservative countries like England a financial revolution so serious as a change in the standard, except actual experience of the difficulties and dangers, which the bi-metallists are constantly predicting, of a reliance on one metal. We shall not see a triumph, or even an approach to a triumph, of the bi-metallic gospel until these predictions are transformed into facts. Foremost among these predictions is that of a general scarcity of gold, involving a fierce struggle for it between the various European countries, with accompanying contraction and fall in prices. If this could now be witnessed somewhere, it would do more for the bi-metallists than any number of pamphlets, or conferences, or conversions. The great difficulty with which they have to contend at this moment is that it cannot be witnessed anywhere, and that the signs of its near approach are no more marked than they were three years ago. In fact, in some countries, whatever alarm there was on the subject is diminishing. For instance, M. Leroy-Beaulieu, in the *Économiste Français* of June 17, after making a little fun of the bi-metallic prophecy that if silver were no

universally remonetized by international agreement, "Humanity, and, above all, the nations of Western Europe, would be short of money," points out that while the Bank of France held only 564,000,000 francs in gold at the end of 1880, it held at the end of 1881 655,000,000, and on the 8th of June, 1882, 944,000,000. In other words, its reserve of gold has been steadily growing for a year and a half, while the bi-metallists were busiest in firing their alarm-guns. Moreover, along with this, the Bank's stock of silver has been diminishing. It was 1,222,000,000 at the end of 1880; it was only 1,157,000,000 on the 8th of June last.

It is true that this rise in the French reserve of gold has been accompanied by a decline in the English reserve, within the same period, of about six million dollars. In other words, the gold which the United States has carried off from Europe in payment for the magnificent crops of 1880, and has been during the past year in part returning, has been going mainly to France through London. But there is nothing very alarming for England in this. That the European supply from American sources will fall off seriously during the coming year, even if our crops are good and theirs bad, M. Leroy-Beaulieu does not think likely, because the American gold product will contribute to the currency, after a fair allowance for industrial purposes, about $28,000,000 annually; and then there is, in addition to this, the Australian and New Zealand product, to say nothing of that of the Ural and Indian mines. Whether these estimates are over-sanguine or not, it is quite clear that the European monometallists are not seriously alarmed, are gaining courage steadily, and see less reason now than they saw two years ago for trying the bi-metallic experiment. Until they are seriously frightened the experiment has no chance of being tried.

LANDING OF THE PILGRIMS — FOREFATHERS' DAY.

At the annual meeting of the Pilgrim Society, held at Plymouth, Mass., on the 29th of May, the question of the anniversary of the landing was brought up for discussion, and it was voted,

"That while we recognize the historical fact that the passengers on the shallop of the *Mayflower* landed on Plymouth Rock on the 11th of December, 1620, and that the 21st of the new style corresponds to the day of the landing, yet, in view of the fact that the 22d has been hallowed by an observance during a period of over one hundred years, and consecrated by the words of Winslow, Webster, Everett, Adams, Seward, and other eminent orators of our land, it is hereby resolved that hereafter the 22d of December be observed by the Pilgrim Society as the Anniversary of the Landing."

Just when the "anniversary of the landing" at Plymouth was first observed, in a social way, by the first settlers and their descendants, is not likely ever to be made certain. That our "pious ancestors" met together from time to time and "talked it over," is probable enough; but in that unhappy age, when men lived without newspapers, the bright things they said were not preserved for our guidance. We find authority for saying that in 1720 "the famous anniversary of our forefathers' landing on the rock . . . was remembered by their descendants"; and Mr. Winchell ('Historical Sketch of the First Baptist Church in Boston') states that Rev. Elisha Callendar is known to have "published a century sermon, in the year 1720, commemorative of the landing of our forefathers at Plymouth, which has furnished many important items for recent historians." The first public celebration of the day at Plymouth was held on the 22d of December, 1769, and thenceforward the day has been kept in memory there by ceremonies in which the best orators of the country have taken part. The event to be commemorated was the landing of the Leyden Pilgrims—men, women, and children—on Plymouth Rock. It was the landing from the *Mayflower*. And tradition unhesitatingly fixes the date of the landing as December 22, 1620—a day, to repeat the words of the Pilgrim Society, "which has been hallowed by an observance during a period of over one hundred years"; and ever as the anniversary comes round, the "sons of the Pilgrims" in New England, and in places near and distant, are drawn together for rehearsal of the scenes of the sufferings and triumphs of their ancestors.

About thirty years ago, however, the Pilgrim Society of Plymouth appointed a committee "to consider the expediency of celebrating in future the landing of the Pilgrims on the 21st day of December, instead of the 22d," and the committee, "having duly considered the subject," submitted as part of their report: "That the happy Monday on which our fathers came, for the first time, on shore at Plymouth from the shallop . . . is the very day that all of us desire to honor as the birthday of Christian freedom and true civilization in New England." The rest of the report, which fills ten octavo pages, is an argument to prove that that "happy Monday," the 11th of December, old style, is the 21st of December, new style. As if any one had ever doubted the fact! But, having changed the day, it was necessary to find an incident befitting the change, and amid the smoke and confusion of the "change of style" the shallop was brought in to take the place of the *Mayflower*.

Now, with all proper respect for the "shallop," we can find nothing remarkable in the landing of the 11th of December. It was an affair of small significance, and of no significance whatever except as it had connection with the subsequent event of the landing from the *Mayflower*. The boat was manned by the ship's seamen and directed by the ship's officers, and the "lusty seaman which steered" saved it from being cast away. On this, the third exploring expedition of the shallop, the immigrant "adventurers" outnumbered the ship's men by only two or three, and Robert Coppin, one of the officers, was no stranger to Plymouth harbor, having visited it on a previous voyage. The boat set out from Cape harbor on the 6th, and on the evening of the 8th landed on an island in Plymouth harbor—an island which has been named Clark's, in honor, so says tradition, of one of the *Mayflower's* mates who "first stepped on shore there." The party remained on that island three nights and two days, and until the 11th, when they "sounded the harbor," "marched into the land" a short distance, and then returned to the ship in Cape Cod harbor. And this is the whole of *that* landing, Mr. Drake ('Nooks and Corners of the New England Coast,' p. 290) says "there are no precise reasons for saying that the exploring party landed anywhere within the limits of the present town of Plymouth, nor any tradition of its making the rock a stepping point"; and Mr. S. H. Gay (*Atlantic Monthly*, November, 1881) finds that "one will hardly escape the conclusion that the harbor they sounded was the harbor all about them surrounding Clark's Island; that the land they 'marched into' was the nearest main land right opposite, straight across the harbor—now Duxbury and Kingston." But whether at Duxbury or at Plymouth, this landing from the shallop on the 11th is of little consequence, because, as we hold, the real Landing of the Pilgrims was quite a different matter. On December 16 the *Mayflower* arrived in the "desired harbor," and it is from the disembarkation that took place some days afterward that Forefathers' Day received its hallowed name. Whether that disembarkation was made in one day, or occupied several days, is not so material. It is the *idea* of a general landing of men, women, and children that has made any one day remarkable; and the stream of literature sets in one plain direction—to the "consecration" of the landing of the pilgrims from the *Mayflower* on the 22d of December, 1620. The fine expressions of the eloquent speakers who have from year to year essayed to illuminate Forefathers' Day, are in no way applicable to the landing from the shallop on the 11th of December. These orators either entirely overlooked the landing of the "happy Monday," or else treated it as an affair of small moment. A pilgrim oration without the *Mayflower*, without the men, women, and children landing on the "ice-clad rock of Plymouth," would as well serve for Independence Day as for Forefathers' Day.

In a sermon by the Rev. Chandler Robbins, preached at Plymouth, December 22, 1793, "being the anniversary of the landing of our ancestors at that place in 1620," we find a clear statement of the historical events which form the groundwork of Forefathers' Day. Mr. Robbins was the minister of a church in Plymouth, his settlement having taken place ten years before the Old Colony Club held its first celebration of the anniversary of the landing. He was versed in general and local history, and appears to have been the projector of the public anniversary addresses at Plymouth. In this sermon Mr. Robbins relates the adventures of the party in the shallop—the landings on Clark's Island and on the main, and the return to the ship at the Cape—and then he continues: "Upon which the ship sails for this harbor, where our worthy and PIOUS ANCESTORS, in this month of December, and on this day of the month, *as our history dates it*, just 173 years ago, here, on this very spot which we now inhabit, began their settlement." As the sermon was "published at the request of those who heard it," we may infer that the speaker and his hearers were of one mind on the historical statements. As showing Mr. Robbins's view of the day and the event that were "observed," his sermon is conclusive. It was the 22d of December, old style, and his words, "as our history dates it," make it unquestionable that there had been no change of date for anniversary purposes conformable to the new style. And it was the landing from the ship, not the landing from the shallop, that pointed his panegyric.

The Hon. Peleg Sprague commenced his address before the Pilgrim Society, December 22, 1835, with these words: "Two hundred and fifteen years ago, this day, a small company of distressed emigrants, consisting of one hundred and one men, women, and children landed on this ice-clad, desolate, and savage shore." Mr. Sprague was born and reared in Duxbury, and must be supposed to have been familiar with all the traditions of the landing; yet he made no reference to the shallop, nor to any landing on the 11th of December. The Rev. Gardiner Spring, in his "Tribute to New England," a sermon delivered before the New England Society of New York, on the 22d of December, 1820, has not a single word for the shallop, but says that the Pilgrims "about the middle of December arrived opposite the town of Plymouth, and on the 22d of the same month landed on the memorable rock so famed in the history of the Pilgrims of New

England." And Dr. Leonard Bacon ('Historical Discourses,' p. 10) says: "On the 22d of December, 1620, one hundred of the Leyden pilgrims, including men, women, and little children, landed from the *Mayflower* on the rock of Plymouth." In Mr. Joseph Croswell's "historical drama," printed in 1802, and entitled "A New World Planted, or the adventures of the Forefathers of New England, who landed in Plymouth, December 22, 1620," the opening scene "represents Plymouth shore, the ship at anchor within the beach, the boat at the rock on which the passengers land."

In 1830 Mr. Francis Baylies published 'An Historical Memoir of the Colony of New Plymouth,' a work, as the author tells us in his preface, "which is the first attempt to embody a connected history of the most ancient colony of New England." Mr. Baylies was born within the limits of Plymouth colony, and was well acquainted with its written and traditional history. His account of the ever-memorable landing of the Pilgrims fixes in print the general—we might with propriety say the universal—sentiment of that event. He makes suitable mention of the shallop expedition—the landing on the shores of Plymouth Harbor, December 8–11; the return to the Cape; the arrival of the *Mayflower* in Plymouth Harbor December 16; the careful examination of the country on the 18th, 19th, and 20th, with the purpose of selecting a place for settlement, and then goes on to say:

"On the 22d the company left the vessel and landed on a rock near the shore, which now bears a consecrated character, to which pilgrimages are made, and to which the posterity of the pilgrims delight to throng, to call up the sublime associations with which its history is connected, and to view the spot which received their forefathers. The honor of having first placed the foot on this immortal rock has been pertinaciously claimed for John Alden and Mary Chilton."

Mr. Savage, writing of John Alden ('Genealogical Dictionary,' vol. i., p. 23), says: "Idly would tradition magnify his merit as the first to jump upon the rock at Plymouth Landing, when he was not of the party in the shallop that discovered the harbor, but continued on board ship at Cape Cod." And, says the same writer (p. 379), Mary Chilton "has by vain tradition been made the first to step on Plymouth Rock, as that honor is also assigned to John Alden, when we know it is not due to either." Now, as the tradition never connected John Alden nor Mary Chilton with the party in the shallop on the 11th of December, but does connect them with the landing from the *Mayflower* on the 22d of December, Mr. Savage, when saying "we know" the honor of first stepping on the rock "is not due to either," is altogether too positive. "We know" nothing at all about it. The tradition is a very old one, and a very important one, adding convincing evidence that the "landing on Plymouth Rock" on the day now known as Forefathers' Day was not made by the exploring party of the shallop on the 11th of December, and that it was made some days later by the whole body of pilgrims from the *Mayflower*.

In the works from which we have quoted, the dates touching the grand event are all put down in the old style of reckoning, just as they had from the first been observed by careful historians. We might multiply our quotations by the score, and to the like purport, for in history, oration, sermon, song, drama, painting, and print it is always the landing from the *Mayflower*, and never the landing from the shallop—always the 22d, and never the 11th of December, that is made to carry the name of Forefathers' Day. The Pilgrim Society returns to its old-time date because that day has been "consecrated by the words of Winslow, Webster, Everett, Adams, Seward, and other eminent orators of the land"; and it might have given another reason—to wit, "because it is the *true Forefathers' Day.*" It is quite improbable that the *Mayflower* can ever be eclipsed by the "shallop."

THE UNIVERSITY RACE.

New London, Conn., June 30, 1882.

It was a fortunate thing for the spectators of this year's University boat-race that the starting hour was fixed at 10:30 A. M. By this arrangement the chances of a postponement were greatly diminished. Experience has taught the college oarsmen that when the state of the tide will permit it, the morning hours are a far better time for the race than those of the afternoon. The Thames, which affords at New London an uninterrupted stretch of over four miles, is exposed at this point to southerly breezes that are likely to freshen the water too much during the afternoon to admit of driving shells over it at a racing pace. To-day the morning breeze from the north, blowing down the course with the tide, gave only a delightful freshness to the air, and hardly disturbed the even surface of the river. No better day could have been selected, and no race could have been better provided for in those preliminaries which are so essential to the comfort of spectators and crews alike. To be sure, New London has advantages which no other course yet tried by the universities can offer. But natural advantages count for little unless the managers of a boat-race know their business, and are determined to carry out their programme upon schedule time, and without those wearisome delays and vexatious postponements which made the college regatta during the Saratoga epoch something to be remembered as a pilgrimage of dreariness and dust.

With the introduction of eight-oared boats another sensible custom of the English universities was adopted—that, namely, of allowing each college to select the referee on alternate years, with the general understanding that each should nominate, if possible, the same person when its turn came round. Accordingly Prof. Wheeler, of Yale, and Prof. Agassiz, of Harvard, have alternately acted as referees since 1876, and the result has been that the college crews have had the satisfaction of knowing that the final conduct of the race lay in the hands of an experienced gentleman, to whose ultimate decision any question in dispute might with perfect confidence be submitted. The great importance and advantage of such an understanding was well illustrated to-day. In settling the final arrangements at the meeting of the "coaches" of the two crews last night, a serious question arose as to the manner in which the two boats should be lined at starting. The Yale shell, owing to the adoption of the new Davis rigging, is built some eight or ten feet longer than that of Harvard, the latter being of the ordinary length. This difference lay in the open space in which the seats and stretchers are placed: in the Yale craft the seats were not equidistant, but so arranged that each couple was detached, and the eight men virtually rowed in four pairs—a distribution which the new style of rigging requires. It was urged by Harvard that if the customary rule were enfored of "starting by the stern and finishing by the bow"—that is, sending the crews off with their rudder-posts even, and declaring the race in favor of the crew whose bow first crossed the winning line—the New Haven men would be given a lead at the very start of just so many feet as the length of their boat exceeded that of Harvard's. The point—which would have furnished material for a week's acrimonious discussion under a régime that was full of such unsatisfactory questions as "the diagonal-line dispute" of 1873 and "the foul dispute" of 1874—was submitted without much debate to Professor Wheeler, who announced as the crews took their stations his decision to start them in the usual way with even sterns, but to *finish* by the stern, too; a conclusion which was as fair an expedient as any suggested, and which left Harvard with only the moral disadvantage of feeling that at least two men in the Yale boat were so seated as to be ahead of Harvard's bow at the start.

It was no fault of either crew that the race was not begun promptly at half-past ten. The Yale men left their boat-house in good season and pulled over to the starting point. Harvard followed in ten minutes, delaying for the coming of the observation train, which had not yet backed up to the start. When the train came in sight the Cambridge men put off from their float, and, drawing up to the line, the two eights lay waiting for the word. Ten of the sixteen men who rowed to-day pulled in the race of 1881—five "veterans" in each boat. Twice had the Yale five, in 1880 and 1881, seen the crimson handkerchiefs behind them when they crossed the winning line. A year of growth and practice had done more for Harvard than for Yale. Although the New Haven men looked heavier and stronger than their rivals, there was no such striking contrast as appeared in their favor a year ago. The referee's boat was somewhat unwieldy in shallow water, and had to steam up above the point so as to turn. As her nose swung round and she drifted down stream, Prof. Wheeler appeared at the bow, rifle in hand. But whether he sent the crews off by a shot or by the word, no one seems to know. At all events, no sound reached the press boat; but a splash in the water, a confused twinkling of oar-blades, and a shout from the excursion train showed us that the race had begun.

So far as we could see, the crews took the water together. Yale dashed off at forty-nine or fifty strokes to the minute. Their "swing" was so short that the men seemed only to bob forward and back with astonishing rapidity. Their stroke was much more irregular, in appearance at least, than that with which they rowed last year; and even then, at a rate of three or four strokes to the minute more than Harvard, they paid little attention to uniformity of swing. But this year they used their backs even less and their arms much more, while they gave, after a long slide, the same powerful kick to their stretchers which carried them to victory in 1881. It is by no means certain that this year's stroke is so uneven as it looks, for it must be remembered that the odd way in which the men are grouped in pairs has much to do with destroying the appearance of uniformity in their movements. One thing was noticeably good in their "form"—they caught the water in perfect unison, and used their legs with tremendous power. Curtis, the Harvard stroke, set his men the (for them) very fast pace of 41 to the minute, as "caught" by two watches at my side; and by so doing showed his generalship, for Yale, instead of opening the commanding lead which even Harvard's most confident backers admitted she was likely to take at the start, failed to gain more of an advantage than a bare half or three-quarters of a length. After the first minute Harvard dropped to 37, with Yale slightly drawing away at 44. The "styles" of the two crews showed an even more radical difference than the contrast of a year ago, with the additional divergence on Yale's side, for the Harvard men pulled the familiar Bancroft stroke—a perfected adaptation of the method brought over from England by Cook, of Yale, in 1873. They showed

the easy recover, the quick shoot of the arms and the strong, even "catch" that marked their rowing in 1881, but with this great improvement, that they used their slides with more effect, and by not swinging back so far as formerly avoided the exhausting strain at the beginning of the recover, and did not bury the nose of their boat—two faults which marred their rowing in the previous race.

At the half-mile Yale's rapid stroke had put her nearly one of her own long lengths ahead, though she was not able to show clear water between the boats, for Harvard clung to her with astonishing tenacity. During the remainder of the first mile the steady stroke of the men from Cambridge began to tell, and Harvard's bow crept steadily up along Yale's starboard side. At the mile flag the two crews seemed to be on even terms, with Harvard rowing at 35 or 36 and Yale at 45. The time, as unofficially taken, was 5 min. 8 sec. Here Yale began to splash, and it looked as though the quick, sharp stroke was beginning to lag, while Harvard, steering an admirably straight course, and rowing at a steady, even swing of 35, drew rapidly away. Half a mile further on Plessner, the Yale coxswain, with the intention, as it afterward appeared, of getting the benefit of the current, carried his boat over toward the eastern shore, while Sanger steered straight along the line of the buoy flags, and Harvard passed the two-mile post in 10 min. 20 sec., with a long lead of over a length clear water. Plessner had made a fatal error. On the left bank grew the long eel-grass, which seriously retarded his crew, and must have lost them a good length or more, for on entering the last mile Harvard led by a distance variously estimated at from two and a half to four lengths clear. At the three-mile buoy Harvard still pulled at 35, Yale pumping away at ten strokes per minute more, with not a man save Folsom pulling his oar clear through.

As the boats entered the last half-mile the race seemed an easy victory for Harvard. But suddenly Folsom quickened his already rapid pace; his men answered with wonderful pluck, and fairly rushed up on the leaders, rowing the last 300 yards at 50 strokes to the minute. Curtis hardly spurted, adding but a single stroke to his pace, which he quickened to 37. The Yale men had won back all the lost ground that they could gain, and Harvard, with only a half or three-quarters of a length of open water between her stern and Yale's bow, crossed the line the winner of the race and the "rubber" in the seventh contest of this character between the two universities—time, 20 min. 47½ sec.

No two crews ever faced each other with such opposing styles. Each rowed in its own way powerfully and well. The stroke which Mr. Curtis set his men was followed with admirable precision, and although throughout the race a tendency to roll was noticeable in Mumford (the bow, and substitute put in Cabot's place, who retired on account of illness only the day before), yet the manner in which he caught the swing and took the water with the rest of the crew, and the strength he showed at his work, went far to neutralize the disadvantages of a change in men at so late a moment. The Yale crew rowed what at least appeared to be a most distressing stroke, with a strength and vigor that astonished even those who expected much from a crew that were called "giants" a year ago. Their brave dash in the last half-mile, and the pluck they showed in responding to Folsom's rally when he drove their pace up to 50 strokes per minute at the finish, was something unprecedented in a beaten crew. But the best Yale oars of past years unite in saying that only the superior strength of their men allowed them to keep up as they did a stroke which their defeat at the hands of a younger, lighter, and less experienced crew has proved to be a failure. Indeed, Mr. Cook went so far as to say that so long as Yale had to be beaten, it was a pity Harvard had not put ten lengths between them at the finish, for in that event the fallacy of the professional stroke would have been established beyond cavil. The result of to-day's race would seem to indicate the truth of the dogma that there is but one correct way of rowing, and that perhaps, after all, the amateur who has spent several years in studying and practising the art of rowing an eight-oared boat is a better coach than the professional who has pulled possibly half a dozen times in an eight-oared crew and never in an eight-oared race. G. W. G.

VICTOR HUGO'S TORQUEMADA.

PARIS, June 12, 1882.

"TORQUEMADA" has been entitled "a drama" by Victor Hugo, and it was perhaps originally written for the stage, but in its present form it could not be brought before the public. "Torquemada" was probably a mere sketch; it was the skeleton of a drama, forgotten among the scraps of the great poet. He has chosen, after many years, to give life to it. I think that I can recognize in it the Victor Hugo of the past, the scenes which were invented many years ago; in fact, the first manner—the manner of "Hernani," of "Ruy Blas." This unfinished drama has been, so to speak, drowned in an ocean of hexameters; the drama has been lost in a sort of lyric sea. Here and there a word, an expression, an attitude, gives one a shudder. You feel moved for a moment; a moment afterward the emotion is gone, the Victor Hugo of the second manner begins to unroll his verses, and you feel as if you were on the seashore: the monotonous waves break at your feet in solemn succession. The words are lost in the thoughts, the thoughts are lost in the words. The French language becomes something that resembles no language: it rolls like a torrent; it whispers or howls like the wind; it moans, it floats, it rises, it sinks; it becomes undefined, unlimited, inorganic. It is a strange sensation. I fancy that the English public does not find it as singular as the French themselves. Some English poets have a certain likeness to the second manner of Victor Hugo; but most French poets have a precision, a dryness, if you like, which contrasts with the vagueness of the "Légende des Siècles" and of "Torquemada."

Victor Hugo has always made rehabilitations in his dramas and in his novels. He is the advocate of all the miserable sinners of mankind. He has rehabilitated the servant in "Ruy Blas," the brigand in "Hernani," the prostitute in "Marion Delorme," the convict in 'Les Misérables,' the monster in 'Notre Dame de Paris'; in "Torquemada" he rehabilitates the inquisitor. This rehabilitation of the "Holy Office" comes at a singular moment, when the Catholic Church is suffering a sort of persecution; when it is deprived of the right of education; when the crucifix is proscribed in all the public schools and all the edifices belonging to the state. I do not believe, however, that the appearance of "Torquemada" will have any influence on the great struggle which is going on between Christianity and irreligion.

"Torquemada" has a prologue entitled "In Pace." We are in Catalonia, in the cemetery of an old convent of the Augustines. A tomb has been prepared—a great vault, which is still empty. The wall of the cemetery is falling in ruins; the garden is in its savage state, flowers grow in disorder round the crosses of the tombs. The prior is walking alone. He compares the Church to his convent in ruins. Kings are becoming infidels; the old faith is gone. A man comes in through the broken wall, followed by an armed troop; he is the King of Spain. He makes himself known to the prior. With him are the King's confidant and minister, the Marquis of Fuentes, and the King's fool, Gucho. Ferdinand, the King, delivers a monologue on the tedium of royalty. He is young, full of passion; he is a man; he escapes at times from his prison:

"Et l'homme qui bouillone en moi, flamme et limon,
Se venge d'être spectre en devenant démon."

The King asks for whom the "in pace" is prepared, and the prior shows him a monk who walks alone among the tombs—Torquemada, a fanatic, who complains of the Pope and his leniency toward sinners and heretics. He must be suppressed; the Church does not like to shed blood—Torquemada is to be buried alive. The King sees also in the garden a young man—almost a boy—and a young girl, who have been sent to the convent. The boy is a prince, the infant Sancho of Salinas; she is the infanta Rosa of Orthez. One is the heir of Orthez, the other of Burgos. They are secretly educated in this deserted convent. Sancho is the cousin of the King, but ignorant of the secret of his birth. He is in love with Rosa. They play among the flowers and the butterflies in the gardens of the convent. Meanwhile Torquemada arrives, and he, too, soliloquizes. He sees all mankind corrupt, all men on the point of sinking into hell. Where is the remedy? The eternal fire can only be opposed by a temporary fire; men must be burnt on earth, so as not to be burnt through the consummation of ages. As the baptismal water has saved them once, fire can save them a second time.

"L'enfer d'une heure annule un bûcher éternel,
Le péché brûle avec le vil haillon charnel;
Et l'âme sort, splendide et pure, de la flamme,
Car l'eau lave le corps, mais le feu lave l'âme.
. . . . . .
Quel père hésiterait? Quelle mère, voyant
Entre le bûcher saint et l'enfer effrayant
Rendre son pauvre enfant, refuserait l'échange
Qui supprime un démon et qui refait un ange?"

This theory of the *auto-da-fé* is not admitted by the Bishop of the Seu-de-Urgel, and the monk Torquemada is led to the "in pace." The monks throw him in the open vault, and put a stone over him. The two young lovers who wander in the garden return in time to save him; they hear the moans of Torquemada. Don Sancho succeeds in tearing an iron cross from a tomb; he uses it as a lever; he opens the tomb, and Torquemada comes out.

Don Sancho is the son of the Marquis of Fuentes, and the Marquis is obliged to keep this secret to himself. King Alfonso has intended to marry Don Sancho, and on the same day to have him killed, as he wants his inheritance. The Marquis is privy to the King's designs, and this gives occasion to a curious scene. The Marquis wishes to save the life of his son, but, as Alfonso is very suspicious, he finds no other way than to appear very inimical to Don Sancho. He presses the King to commit the murder, and the more he presses him the more the King becomes suspicious. He finally contents himself with putting Don Sancho and his bride into a convent. This incident forms the first act. The second act brings us to Italy, in the cell of a hermit, Francis of Paola. Torquemada arrives, and a conversation takes place between Francis of Paola, who represents charity and universal forgiveness, and Torquemada, who advocates repression and salvation by force. There are some very fine verses in this long poetical duet. The conversation is interrupted by a hunter, who represents mere epicureanism and materialism. He laughs at the sentimentality of Francis of Paola as well as at the fanaticism of Torquemada; he goes for immediate, sensual happiness,

and the conversation ends thus. Francis asks Torquemada,

"Qu'est-ce que ce bandit?"

Torquemada answers:

"Mon père, c'est le pape."

The third act takes us back to Spain, to Seville, to the Council room. The Great Rabbi comes before the Marquis of Fuentes, and offers an immense sum in gold to save the Jews condemned to be burned by the Holy Inquisition. The King arrives; he is impatient of the rule of Torquemada, who has become the true King of Spain. He wants gold, and so does his wife Isabella; but they dare not face Torquemada, and the great ceremony begins on the *quemadero*. The fires are lighted, burning pitch is thrown on the heads of the Jews, the women scream, Torquemada triumphs.

Ferdinand tries to console himself as well as he can. The Marquis of Fuentes brings Don Sancho and Doña Rosa into the private park of the King, his intention being to help them to run away from the kingdom. He thinks that the King is absent, and is only afraid of the Holy Office, which is very near. Torquemada has received a key of the private park from the hands of the King's fool, and when the two lovers are left alone, he appears; and as they had saved his life and taken him out of the "in pace," he comes to protect them against the King's evil designs. Here comes in the most extravagant part of the drama. He reminds Don Sancho of the scene in the cemetery, and asks him how he lifted the heavy stone on the tomb. Don Sancho tells him that he did it with an iron cross, torn from a tomb. This is a sacrilege, in the eyes of Torquemada. Don Sancho is damned: how can he save him? There is but one way left: he must be delivered to the Holy Office and burnt with his bride. Torquemada has no doubt, no hesitation; and this situation, absurd as it is, gives rise to a scene which resembles somewhat the last scene in "Hernani": two young people in love, singing together the most poetical songs of love, in each other's arms, forgetting the whole universe, and absorbed in each other; and, close by, death making ready and arriving. In "Hernani" the terrible signal is given by the sound of the horn, and the cruel Ruy Gomez de Silva arrives and reminds Hernani of his promise. In "Torquemada" the end is different. Torquemada is gone; the two lovers are left alone in the night. During their ecstasy the great staircase fills up with a procession of penitents in black and white. Their banner mounts slowly; it bears a death's head and two bones forming a cross, white on a black ground. Don Sancho and Doña Rosa hear the murmur of the procession; they see it coming; they understand: the Inquisition is approaching; in a moment they will be seized and thrown into the flames. Don Sancho screams "Ciel!" and the curtain falls.

Correspondence.

ASSESSMENTS BY THE ROMAN BOSSES.

To the Editor of The Nation:

Sir: In your issue of the 29th inst., speaking of the "circular issued by the Republican Congressional Committee," you say: "It would be impossible to find in the records of any corrupt monarchy of the eighteenth century a trace of a proceeding so paltry and degrading on the part of persons holding a high, or indeed any, position connected with the government." Now, though you may not find this trace in any *monarchy* of the eighteenth century, or perhaps of any other century, still, I think I can point you, not to a "trace," but to an actual "proceeding" bearing a significant resemblance to the Congressional Committee's circular and levy, in a republic or commonwealth—a commonwealth, too, to which in our college days we were wont to "point with pride." If you will turn to Arnold's 'Later Roman Commonwealth,' pages 417, 418, you will find some account of the republican methods adopted by the Triumvirs Lepidus, Antony, and Octavius for raising funds for *their* "campaign." On page 417, we read:

"The Triumvirs, finding themselves still in want of money, drew out a list [or circular] of fourteen hundred ladies, who were ordered to make exact returns of their property, that a proportionate tax might be levied upon them. This excited great indignation, and the persons aggrieved . . . assembled themselves in the forum, and, trusting to the protection of their sex, addressed the Triumvirs in very forcible language, and succeeded in obtaining from them an abatement of the greatest part of the tax which it had been intended to raise. But as the men could not utter their complaints with equal safety, they were condemned to make up the deficiency. Every person, of what rank or condition soever, who was possessed of property to the amount of more than 400,000 H S., or about 3,200 *l*., was required to furnish a loan of two per cent. on all that he was worth," etc.

Please mark the percentage—"two per cent."! How exactly history will sometimes repeat itself! W.

New Haven, Conn., June 30, 1882.

EARLY MENTION OF ASSOS.

To the Editor of The Nation:

Sir: Mr. J. T. Clarke, whose admirable report on the investigations at Assos during last year is in the hands of some of your readers, and who is now, with Mr. Bacon, continuing the work at Assos, is desirous of learning if there is any mention of Assos by ancient writers (excepting references to the Assians Hermeias and Cleanthes) besides the notices of it by Strabo, Pausanias, and Pliny, and the following: Xenophon, Agesilaus, ii., 26; Acts of the Apostles, xx., 13; Lucian, Tragopodagra, 161; Athenæus, Deipnosoph., ix., 17; Anthol. Græc. ed. Brunck, iv., 195; Steph. Byzant., *s. v.* Assos.

He also wishes to know if there is any mention of Assos in mediæval history, except by Ducas and Georgius Pachymeris; or of Behràm before Choiseul's visit.

Should any of your readers be able to add to Mr. Clarke's knowledge on these points, I shall be much pleased to transmit to him such information as may be sent to me for him.

Your obedient servant, C. E. Norton.

Cambridge, Mass., June 29, 1882.

Notes.

Macmillan & Co. publish immediately, from the eighth London edition, 'Rules of Simple Hygiene, and Hints and Remedies for the Treatment of Common Accidents and Diseases,' by Dr. Dawson Turner. They have just issued an abridged edition of a work having a large capacity for being abbreviated, for the sake of the reader's feelings—Dr. Benham's 'Memoir of Catharine and Craufurd Tait.'

Wm. S. Gottsberger will issue in a few days a corrected edition of Lady Georgiana Fullerton's translation of Mme. Craven's 'Éliane.' This novel has reached a fourth edition in Paris.

Harper & Bros. have printed in two forms, cloth and paper, Carlyle's 'Reminiscences of My Irish Journey in 1849'—doleful jottings, which, in their present unliterary shape, the writer himself could never have imposed on the public.

The season of college boat-races has seemed to Houghton, Mifflin & Co. a proper one in which to bring out a new edition of the Harvard story, 'Hammersmith,' by Mark Sibley Severance.

A newly-discovered Fourth of July Oration delivered by Daniel Webster at Fryeburg (now in Maine, then a part of Massachusetts), in 1802, when he was but twenty years of age, has been brought out by A. Williams & Co., Boston. Its style makes it a notable production, and in its general conception it is thoroughly Websterian.

The latest publications of the Census Bureau have been numerous and important. They include two bound volumes—part 1 of the Population Tables, and the Statistics of Public Indebtedness; and the following in paper: 'History and Present Condition of New Orleans, La., and Report on the City of Austin, Texas,' by Geo. W. Cable and Geo. E. Waring, jr.—full of matter of permanent interest, and well supplied with maps, historical and other, of the former city; 'Report on the Cotton Production of the State of Louisiana,' by Prof. Eugene W. Hilgard; 'Statistics of the Production of the Precious Metals in the United States,' by Clarence King; 'Statistics of the Manufactures of Baltimore, etc. [20 cities], during the Census Year June 1, 1879-80'; 'Report on the Silk Manufacturing Industry of the United States,' by Wm. C. Wyckoff; and 'Report on the Manufacture of Fire-Arms and Ammunition,' by Chas. H. Fitch.

In the *American Architect* for June 24, beginning is made of a series of articles on the English Cathedrals. A table of the leading dimensions, and a photographic bird's-eye view of paper models executed to a uniform scale, enhance the value of the text, which is descriptive and historical.

Mr. W. F. Poole's report on the progress of library architecture, made to the American Library Association at Cincinnati in May, has been printed in pamphlet form (Boston, 37 Hawley Street). It is outspoken in condemnation of the library building begun in Baltimore by Mr. Enoch Pratt for his noble foundation. The architect "had taken the advice of no practical librarian," and had read none of the recent debates and papers on library construction.

"Bi-Centennial Reading" is the title given by Mr. F. D. Stone, Librarian of the Pennsylvania Historical Society, to bibliographical notes on the history of that State published in the July Bulletin of the Library Company of Philadelphia.

In the *American Naturalist* for July Mr. R. Ellsworth Call concludes his article on "The Loess of North America" with an essay toward a bibliography of the loess; Mr. Ivan Petroff, in treating of "The Limit of the Innuit Tribes on the Alaska Coast," points out the liability to deception in estimating the time of man's settlement by means of shell-heaps (which at a single meal attain dimensions past belief unless the accumulation is witnessed), or from the traces of habitations (the inhabitants being accustomed to carry off everything of wood or iron on removal, and nature soon obliterating the lines of the buildings). The editors make another vigorous protest against the Secretary of the Treasury's ruling on imported books and the law on which it is based.

J. W. Bouton, 706 Broadway, New York, will receive subscriptions to the limited edition (500 copies) of Ferdinand Ongania's continuation of Kreutz's 'La Basilica di San Marco in Venezia.' The numerous plates, engraved or in chromolithograph, represent the church in a great variety of aspects and details. It will be issued in parts, and will not be completed till 1884. The cost will not be far from $160.

The first instalment, A—Bli, of Victor Gay's important 'Glossaire Archéologique du Moyen Âge et de la Renaissance' has been produced by

the Société Bibliographique. It covers a much wider field than Viollet-le-Duc's dictionaries, which it resembles in point of illustrations. The objects defined and figured relate to the chase, to games, musical instruments, furniture, the industrial arts, commerce, agriculture, etc., etc.

Mr. C. W. Sutton's second Manchester bibliography (for 1881) shows that, as might be expected, the thoughts of her writers run chiefly in the sociological and commercial direction. The heading "Politics, Commerce, and Social Questions" includes fifty-six of the 323 works recorded, more than any other of the classes.

Part 2 of the fifth volume of the *Deutsche Geographische Blätter* has made its appearance. It contains articles on the soil, population, industries, mines, etc., of the Gold Coast, by Paulus Dahse; on the Chukchi peninsula and Alaska, by the brothers Krause; a visit to Timor, by Th. Studor, and a number of shorter communications, besides two maps, several cartoons, and a woodcut of Plover Bay.

M. Louis Figuier has recently put forth as a sort of prospectus a pamphlet called 'Le Théâtre Scientifique' (Paris: Dentu; New York: F. W. Christern), in which he bewails the silence of the stage toward science, and declares his intention of inventing the scientific drama, just as M. Jules Verne has invented the scientific novel. To this end he has written 'Denis Papin; or, The Invention of Steam,' a scientific and historic drama in five acts and eight tableaux; and two others like it, one on Gutenberg and the other on Keppler. M. Figuier announces that the first of these, and perhaps all of them, will be acted this summer at the Folies Dramatiques in Paris, set off by ingenious models of the original machinery of the inventors whose lives are dramatized.

—Mr. James B. Gregg writes us from Colorado Springs:

"In the July number of the *New Englander* an excellent article on 'The Old Testament in the Christian Church' is credited to my authorship. By what curious casualty this occurs I do not know. But I am not the author of the article in question. I do not know who the author is. I regret that I should receive honor which does not belong to me, and that in any degree I should deprive another."

—The degree of Doctor of Philosophy is in a bad way, and two learned bodies are endeavoring to redeem it. In the seven years 1872-79 seventy-nine colleges granted it 345 times—175 times after examination, 170 times *honoris causa*. If one were to be told that in eight years the degree of M.D. had been made honorary 170 times, he would surely be amazed; but really, in their own origin and estimation in Germany, as well as in the practice of bestowing them only after examination, M.D. and Ph.D. stand exactly on a level. They represent proved attainment, and consequently confer an intellectual and moral distinction, and have a ratable value in seeking a livelihood. To multiply them, or the kindred degree of Doctor of Science, without regard to acquirements or tests of any kind, is of course to undermine their worth everywhere. The above figures show how far the evil has already gone in this country, and what urgent need there is of reform before it has gone too far. There lies before us a circular letter, addressed to the Boards of Control of the colleges of the United States by a joint committee of the American Association for the Advancement of Science and the American Philological Association, setting forth the history of the degree of Ph.D. and the abuses in the bestowal of it, and praying for a discontinuance of the practice of making it and that of S.D. honorary. The committee embraces names of which the weight will be at once recognized: Profs. John W. White, W. D. Whitney, B. L. Gildersleeve, I. J. Manatt, C. R. Lanman, Geo. J. Brush, the late Prof. W. B. Rogers, Prof. H. C. Bolton, President F. A. P. Barnard, and Profs. J. P. Lesley and F. W. Clarke. The case does not call for many words, and we cannot doubt that the trustees and faculties for whom the circular is intended will largely, if not universally, give heed to it and amend their behavior. The following consideration is one of the most forcible. The degree of Doctor of Philosophy, which in the German scheme embraces the humanities and the mathematical and natural sciences, is, says the circular—

"in a preëminent sense the appropriate degree for teachers, a large and growing class of persons in this country. Three colleges in the United States have within the last twenty years conferred this degree after examination upon 119 different persons, of whom seventy-five per cent. have adopted the profession of teaching. It is reasonable to suppose that the number of colleges in the United States which within the next fifty years will establish graduate schools in philosophy will be large. The degree which these schools will then confer will be that of Doctor of Philosophy, and it is for the interest of all alike that its significance should not be obscured."

—A large number of excellent people, comprising both those who are and those who long to be "cultured," should thank Mr. Fitzedward Hall for his article in the current number of the *American Journal of Philology*. It is "on the separation, by a word or words, of *to* and the infinitive mood." We have all bowed to the tyrannical rule that such a separation is intolerable in good English; and we have all perceived at times how rhetorical stress and perspicuity could only be secured by violating it. Now comes Mr. Hall with examples of the forbidden usage dating as far back as Wyclif, and as recently as Leslie Stephen and Matthew Arnold. There are some gaps in the chain: no instances are adduced for the first half of the fifteenth century, nor for the fifty years after 1471. But Mr. Hall implies that his enormous reading has been less thorough in these periods, and has no doubt that close examiners will find relevant examples. For the seventeenth century he quotes, among others, Sir John Harington, Dr. Donne, Sir Thomas Browne, Samuel Pepys, and Dr. Richard Bentley; for the eighteenth, Defoe, Burke, John Wilkes, Charles Dibdin, Madame D'Arblay (who was a "separatist" indeed), Dr. Johnson; for the nineteenth, Southey, Coleridge, Lamb, Wordsworth, Ruskin, Bishop Wilberforce, etc., etc. In this as in his kindred writings, Mr. Hall's attitude is not that of a dogmatist, or an authority anxious to impose himself, or hardly an arbiter. He does not say he thinks it a matter of indifference whether the *to* is separated from the infinitive or not; he does not distinctly advise or approve the separation under specific circumstances. He thinks it odd that Dr. Johnson, Macaulay, and De Quincey furnish each one example and no more (most of his readers will be amazed rather that one man has sifted with approximate certainty "professional authors so voluminous" as these). But in the end he leaves the educated and uneducated free to act upon the evidence laid before them, and terrified only at the fate of the learned dunces whose injunctions have once more been shown to rest on superlative ignorance of the best usage—the fate of being slain again. This paper, by the way, has the incidental quality of being a lesson in the precise use of words, many of which are seldom met with in the literary vocabulary. But this we always look for in Mr. Hall's writings, as we do for some hard reading in consequence, and as we do for much unfamiliar information in his foot-notes—*e.g.*, "Not a single sentence of all that has been handed down as from the pen of Wyclif can unhesitatingly be averred to have reached us in his very words."

—At a late meeting of the Library Association of the United Kingdom, Mr. Taylor, of the Select Subscription Library of Edinburgh, discussed the bibliothecal prospects of that city. Some time since, the citizens, after lively discussions and great show of placards, mural and moving, and sufficient personalities, as is the method of British elections, refused by a considerable majority to accept the Free Libraries Act and tax themselves to furnish the people with free novel and other reading. This decision Mr. Taylor would use to the profit of his library. The best method you can adopt, he says to the opponents of the act, to forestall the inevitable renewal of the attempt to force a free library upon us is to preoccupy the ground with a well-supported, vigorous subscription library. And then he gives his views of the way in which the present institution can be made to deserve such support. We have so few subscription libraries in this country that Mr. Taylor's paper will not have a very general interest for Americans. The few whose experience has run in the same line as his will approve of his remarks. It is well that every library should keep up with the times, but it is indispensable for the subscription library. The instant the supply of new books drops off, the subscribers drop off also, and with them the means of a better supply. Sell three-quarters of the old books, and the paying public will not know the difference; fail to provide them with novelties, and they lose all interest in the library. Of course there are many books which remain always in moderate demand—Macaulay, Carlyle, Scott, Dickens, Thackeray, and the like; yet many who once were named with these are heard of no more. The demand for and satisfaction in books of travel passes by as quickly as the vogue of any class. With some exceptions, biography becomes "dead stock" very soon, considering how great is the interest in it when it is fresh. Science nowadays dies at one end as rapidly as it grows at the other; and as the public may not be able to distinguish for themselves what is obsolete, they are all the more suspicious of anything that does not bear the latest imprint. Old fiction is read, to be sure, but the difference between the eagerness with which the last new novel which everybody is talking about is seized upon, and the resignation with which the same novel a year hence will be endured because all the latest publications are "out," is very instructive to the mercantile-librarian, whose very existence depends upon his success in giving his customers keen pleasure.

—The moral of all this is, that the mercantile library or the athenæum which has no permanent fund to meet its running expenses and to buy books when, for some temporary cause, its subscriptions fall off, must conform to the practice of those booksellers who keep circulating libraries: it must get many books with the distinct intention of selling them when the demand has ceased. In most of our cities the public library is slowly killing the mercantile libraries. When people can get books for nothing, they will not pay for their reading, unless they are offered some very decided advantages in a supply of new books larger in proportion to the number of borrowers, or in the superiority of the service, or the greater pleasantness or greater convenience of the situation. These advantages the fundless mercantile library can usually furnish only by confining itself to circulation. When by good luck it receives an endowment from gifts or legacies, it may indulge in the luxury of a reference department. But even then it would wisely dispose of a considerable portion of the emptiness and the heaviness which the popular craving for "actuality" forces it to buy. There are libraries which are museums, like the Lenox;

others which are scholars' working-rooms, like the Astor; others which are for the general intelligent public, like the Brooklyn; or for the very poor public, like the Free Library. As the objects of these are so different, so must be their equipment; and the same difference of practice which they observe in buying they might well observe in regard to keeping or disposing of their books. There is a great outcry against a librarian's or a library committee's acting as a *censor librorum*. "Index expurgatorius" is an invidious term; and if it were a question of theological prejudice, *odium medicum*, scientific jealousy, or even of literary taste, the objection might be sustained. But when the criterion is a mere matter of fact, ascertainable by statistics—a question not whether a book may be wanted a hundred years hence, but whether any one wants it this year enough to pay for it—it is difficult to see why a practical man with sufficient experience may not safely apply it, with only such occasional mistakes as accompany all mortal judgment. But, as we said, the number of libraries which are obliged to conduct themselves on such strictly business principles is small in this country, and not likely to grow greater. They never can maintain themselves in competition with the endowed and their publicly supported rivals; and the American temper is so generous, and the respect for learning and historical research so strong among us, that endowed libraries are increasing in number even more rapidly than population.

—The last number of the London *Publishers' Circular* (June 15) tells of a curious mode of advertising adopted by some tradesmen of Bristol and Clifton. They "bought large numbers of copies of *Punch*, which is published at 3*d.*, and sold them for 1*d.* each, after putting on them a wrapper of their own with the title of *Punch* on it, and advertisements for which they were paid." This, it appears, would not have troubled the proprietors of *Punch*, but the defendants (as they speedily became in a suit for an injunction) went further, and between every two leaves of the paper put two pages of paid advertisements. The Court put an untimely end to the speculation. Another case, arising before the same Justice Chitty, has a cisatlantic interest. Has the author of a paid magazine article any property in it after its first appearance in print? The publisher's right to re-use it in any way and at any time would seem to be indisputable. Is there a concurrent right in the author to reproduce it, either by itself or in connection with his other writings, without the leave of the proprietor of the serial to whom he originally disposed of it? If so, what he really sells is the privilege of first printing, as, in lieu of international copyright, English authors were glad to do to American publishers. The practice in this country would probably be found to confirm the American reputation for good nature. Not always have writers had the courtesy to ask permission of the publisher, or even to acknowledge in the preface a previous appearance in this or that periodical. Seldom has the publisher refused the request when made, or troubled himself over the want of civility. But it may well be imagined that in such cases the writer has not yet achieved a literary standing, or that the publisher thinks the game not worth the candle. The British case is as follows: Messrs. Chapman & Hall, proprietors and publishers of the *Fortnightly Review*, move for an injunction to restrain Messrs. C. Kegan Paul & Co. from publishing as a book certain articles on Afghanistan from the *Fortnightly*. The rest may best be given in the words of the *Publishers' Circular:*

"The writer, Mr. Blunt, was employed by the plaintiffs to write the articles in question, which were published in the *Review* between August and January last. The author subsequently collected them and had them published by the defendants; and the plaintiffs, on the ground that the copyright was theirs, asked the Court to restrain the separate publication. The author submitted that he had a right to do what he had done, and said that he had the permission of the editor, Mr. John Morley. To this Mr. Chapman replied that the editor was their servant, and could not give permission, to which Mr. Morley set up editorial prerogative; and the defendants also contended that the plaintiffs only had the right to publish the article in magazine form, while the right to publish in a separate form remained in the author."

The Court granted the injunction till the trial or till further order, but the plaintiffs gave the defendants permission to publish till the trial, on condition of their keeping an account.

—As we alluded in No. 877 to the question raised in the *Palatine Note-Book* about the presence of Roger de Montgomery at the battle of Hastings, we must also mention the long and candid and good-natured consideration which Dr. E. A. Freeman gives to the arguments of his critic in that publication, in the *Academy* for June 17. The result is, that the historian of the Norman Conquest does not find his general faith in his authority, Robert Wace, shaken. "But," he concludes, "I should now think it right to call more attention than I have done to the fact that Roger's name is not on William of Poitiers' list. That certainly throws some measure of doubt on Wace's story, which the passage in Orderic [implying that Roger was left behind in Normandy], to my mind, does not."

—Is Paris trying to rival London as a cosmopolitan city? In the English metropolis of the world there are said to be more of some nations than there are in the native country—more Norwegians than in Norway, for instance. But there is apparently in Paris a supply of foreigners of good quality, if not of great numbers, to judge from the success of M. Charles Rudy's "Association Internationale de Professeurs." Under his lead, during the past six months, twenty lectures have been delivered in as many different languages on the present literature of as many nations. A Greek, a Russian, an Armenian, a Rumanian, a Pole, an Arab, a Provençal, a Japanese, a Dutchman, and eleven others lectured each in his own tongue to an audience composed in part of his own countrymen and in part of other persons. The enterprise has been so successful that it will be continued another year. New York could show representatives of as many nationalities; but how many of them would care to listen to a literary lecture?

—When a man is convicted of murder on circumstantial evidence and hung, and a few months afterward the murdered man turns up still alive, it does not increase our confidence in trial by jury. When experts contradict one another flatly on a question of writing, and the issue of the case shows that both sides were wrong, it makes one a little suspicious of expert testimony. Something like a combination of these two warnings to be cautious has occurred in a literary way in France. M. Ménard discovered some unpublished verses of Bossuet in the National Library, and printed them in the *Nouvelle Revue*. Whereupon the learned M. Ch. Livet proved that the manuscript could not be by Bossuet. Another critic proved from internal considerations that the verses were not even of the seventeenth century. On the other hand, a professor demonstrated that the verses might possibly be by Bossuet. Then the murdered man turned up. M. Brunetière pointed out, in the *Revue des Deux Mondes*, that the verses were not unpublished, that they had been printed in the 'Œuvres complètes de Bossuet,' and that there was not the slightest reason to doubt their authenticity. *Hæc fabula docet*—what shall we say?—put not your trust in critics?

—The Franco-German War, as is well known, led to a great revival of Teutonic feeling in Germany and a reaction against everything French. Language of course felt the influence. The great work of the General Staff on the war substituted German for French terms wherever it was possible. The Postmaster-General, Stephan, did the same in all postal matters. And when the telephone was invented, Government would not have the word used, but insisted on *Fernsprecher*. Carrying out the same idea, Dr. Dunger, in his 'Wörterbuch von Verdeutschungen entbehrlicher Fremdwörter' (Leipzig, 1882), prints a list of some 5,600 German words which in his opinion ought to be substituted for the corresponding French words. Some of the Dutch have caught the infection, and are calling for a similar proscription of linguistic foreigners. "The French must go."

—Several works of more than ordinary interest have been published within the last two or three years upon the history of Germany in the fourteenth century. First, and perhaps most important, is a continuation of Kopp's great 'Geschichte der eidgenössischen Bünde.' This encyclopædic work, the indispensable foundation of study for the period of which it treats, is a specimen of the very worst type of German arrangement and the very highest type of German erudition. Published at intervals, from 1845 to 1858, it reached the first half of the fifth volume (Book xi.), covering the period from the accession of Rudolf of Hapsburg (1273) to 1330—an exhaustive history of Germany during these years being the necessary background for a history of the Swiss Confederation. We have more than once tried ineffectually to find our way in the labyrinth of *Band*, *Buch*, *Abtheilung*, *Abschnitt*, and *Hälfte*—each volume, moreover, having two title-pages, one as a history of the 'Eidgenössische Bünde,' the other of the 'Wiederherstellung und Verfall des heiligen römischen Reichs.' The new volume, prepared by A. Lütolf, and published after his death by F. Rohrer, is the first half of the second division of the fifth volume, and embraces the years 1330 to 1334. To a somewhat earlier period belongs 'Clemens V. und Heinrich VII.,' by Dr. C. Wenck, a student of merit in this period. Treating of "the commencement of the French papacy," it is a valuable contribution to the history of the ecclesiastical power.

—'Der Kampf Ludwigs des Baiern mit der römischen Curie,' by Dr. Carl Müller, *Privat-Docent* in Berlin, is also described as a contribution to the ecclesiastical history of the fourteenth century, and is no doubt the most complete account of this last stage of the great contest between Pope and Emperor. It was not a battle of the giants, like the earlier contests: neither Emperor nor Popes at this period were worthy to be ranked with the Fredericks and the Gregories and Innocents, whose conflicts fairly shook Europe in the twelfth and thirteenth centuries. Nor were the issues so vital. The Roman Curia had fairly triumphed in the last great encounter; but when Boniface VIII. pushed his claims to those of a veritable theocracy—at a time, too, when all the forces of society were working in the direction of secular interests and political powers—there could not fail to be a decisive reaction. The effort to restore the imperial prestige, represented in literature by Dante, and in action by Henry of Luxemburg, was checked by the sudden death of this able Emperor. An equally able and decided successor might have taken up his unfinished work and carried it to a triumphant end.

Louis of Bavaria had neither the heart nor the ability to do this. The chief interest in his long but spasmodic contest centres in the great men of letters who gathered at his court and provided him with weapons in the controversies in which he was engaged. This subject had been previously treated by Riezler, in his 'Literarische Widersacher der Päpste.' Müller's work, however, is broader in its scope, embracing the political as well as the literary side of the contest. Indeed, the political aspect of the contest of this period is the most prominent one. It was complicated by a disputed election to the empire, in which, as the historian remarks, it was really a matter of secondary importance whether it should be Louis of Bavaria or Frederick of Austria: "It was the German kingdom, and more especially this kingdom as associated with the Empire, that the contest concerned." The book is, therefore, "rather a history of the relations of the German state to the Roman Curia than merely a history of the contest of Louis of Bavaria." The victory of the Curia Müller pronounces a "Pyrrhus-victory": "it implied the defection of the mediæval world from the papacy; and this breach now proceeded to widen more and more, especially under the influence of the Great Schism."

—The successor of Louis of Bavaria was Charles IV. of Luxemburg, King of Bohemia—elected by the influence of the Curia as a rival to Louis (hence called *Pfaffenkönig*, "priests' King"), but who succeeded in making his kingly office practically independent of the papacy. His history, 'Geschichte Kaiser Karls IV. und seiner Zeit,' by Dr. Emil Wernusky, author of meritorious monographs upon this period, may be regarded as continuing the history of Müller. The first volume, however, published in 1880, covers the same ground as part of Müller's work, being a life of Charles during his early years, when he was Margrave of Moravia. It ends with his election to the imperial office in 1346. Three more volumes are expected to complete the work. Charles IV. was elected King during the life-time of Louis, and as his rival, the representative of the opposite, or papal, party. Immediately afterward Louis died, and Charles succeeded to the throne without serious opposition. It is not surprising, however, that the anti-papal party made another effort, at first attempting to persuade Edward III. of England, and then Frederick the Serious, Landgrave of Thuringia, to accept the crown, and, upon their refusal, setting up Günther of Schwarzburg as a shadowy emperor. This episode is treated by Dr. Karl Janson in a monograph entitled 'Das Königthum Günthers von Schwarzburg.' The author pronounces Günther a person of no strongly marked personality—a mere tool, used as long as he was found serviceable. It will be several years before Wernusky's history of Charles IV. will be finished; that of his son and successor, Wenceslas, lies completed before us. Lindner's 'Geschichte des deutschen Reiches vom Ende des vierzehnten Jahrhunderts bis zur Reformation' is built on too large a plan ever to be executed in full. The first part, however, "Unter König Wenzel," is complete in two volumes. The first volume, published in 1875, extends from the accession of Wenceslas in 1378 to the year 1387, and is principally occupied with the Swabian confederacy of cities and its wars. The second volume, published in 1880, ends with the deposition of Wenceslas in 1400. A large part of the interest of the volume centres in the Hanseatic League and the affairs of the North; for the history of Germany itself the deposition of the Emperor takes the first place in interest. It has been extensively discussed whether this act was legal, and whether, if legal, it was justified by the circumstances. The most judicious modern historians have pronounced against it, but Prof. Lindner hesitates to express himself positively. As to the legal question, the electoral college certainly had no well-defined constitutional power in the premises, but a certain reserved and undefined right, strictly revolutionary in its nature. As to the reasons alleged, they were very strong—the strongest being the infringement upon the rights of the Empire by the bestowal of the dignity of Duke upon John Galeas Visconti of Milan for money, as was charged. There is no doubt that Wenceslas was utterly inefficient and incompetent; nevertheless, the historian concludes, on the whole (p. 439), that the electors "would have better served the interests of the Empire as a whole if they had had patience with Wenceslas, and made further efforts to influence him."

SCHLIEMANN'S TRAVELS IN THE TROAD.

Reise in der Troas in Mai, 1881. Von Dr. Heinrich Schliemann. Mit einer Karte. Leipzig: Brockhaus. 1881. Pp. 77. [A reprint of articles published in *Unsere Zeit*, 1881, Nos. 8 and 9, with considerable additions.]

THE popular and just admiration of Dr. Schliemann's energy, enthusiasm, and, above all, material successes as an excavator, has only been equalled by the dissatisfaction which his publications have caused among the more learned and exacting. The book before us will do little to better the writer's reputation with these unfavorable critics. It strikingly displays all the faults of untrustworthiness and pretence hitherto condemned, while, instead of the discoveries which made the earlier works on Mykenæ, Troy, and Orchomenos so intrinsically important, it only tells of an unsuccessful and uneventful expedition.

Schliemann's purpose in undertaking this journey through the Troad in May, 1881, was to ascertain what ancient sites of the land, with exception of Hissarlik, were promising fields for archæological excavations. The result at which he arrives upon his last page is entirely negative:

"Although in Hissarlik a layer of Hellenic débris two metres thick was seen to overlie prehistoric rubbish fourteen metres in depth, I now know that there is no site of prehistoric ruins in all the Troad—between the Hellespont, the Gulf of Adramyttion, and the mountains of Ida—excepting perhaps Kurshunlu-tepeh, where the débris is in some places one metre deep, and where sherds of prehistoric pottery may be found at the bottom of this stratum. I know that even (!) excavations for antiquities of the classical period are nowhere possible in the Troad, with the exception of Assos, which is now being dug out by American scholars, and perhaps also of Antandros and Alexandria Troas, where the accumulated earth may reach a depth of three metres."

This conclusion is the more discouraging as Dr. Schliemann has obtainedan exceptionally favorable firman from the Porte, through the diplomatic influence of the nation to which his collection of Trojan antiquities was presented. While permissions to excavate Turkish soil for the purposes of archæological research have hitherto been limited to a single town or village, Schliemann is now allowed to pursue his investigations throughout the entire Troad without further formalities. But thus disappointed in the preliminary explorations, his work during the present season seems to be again limited to the immediate vicinity of Hissarlik.

The most noteworthy, and in fact the only interesting, result of last year's journey was the following of an eastern passage around Ida in going from Adramyttion (the Theban Plain) into the valley of the Scamander. From a much-vexed remark of Herodotus (vii. 42) this is commonly held to be the route taken by the army of Xerxes on the march from Sardis to the Hellespont. Unfortunately Schliemann seems to have seen nothing on his way across the mountain, from Kadi to Obi-kioy, and gives no account of the character of the landscape or road, only relating the tales told him of the curious plant *agil*, said to be poisonous to the cattle in the early summer months. The eastern pass is not even indicated on the map, an addition to the work which, though recommended to the "quite particular attention of the reader" as being of the utmost precision, is bad almost beyond belief. The coast-line, rivers, and mountain ranges are entirely out of their natural position; the island of Lesbos, for instance, being drawn without its two great gulfs. In passing hurriedly through the land, the author frequently mistook the village names, as in the case of Arablar, which is indicated as occupying the site of Burgaz; and the reader minutely interested in the geography of the country will do well to follow the route upon the Prussian survey of 1844, the Austrian military map, or the charts of the English Admiralty, which, in the case of the Troad, extend far inland.

A considerable part of the book is taken up with the ordinary traveller's descriptions of Turkish grave-yards and fountains, stork-nests and cuckoos, which it is needless to review. The author boasts that the remaining observations concerning ancient sites "overthrow theories which have existed for thousands of years and have never before been contested or doubted"; but, notwithstanding this assurance, there are few of his pages which do not require correction. The accounts of Alexandria Troas, and Tuzla (Tragasae) may be dismissed from consideration, as they are translated almost literally, but without acknowledgment, from Mr. Pullan's contributions to Murray's 'Guide-book for Turkey in Asia.' The errors of earlier writers in regard to these two sites are repeated—as, for instance, the statements that the gymnasion of the former contained four square chambers; that the mosque of the latter was once a Byzantine church, etc. The city of the Troad concerning which one would most desire information—the ancient Neandria on Mount Chigri—which presents in its extensive and well-preserved walls the most important remains of early Greek fortifications in all Asia Minor, with exception alone of Assos, was apparently not visited at all; an omission which is the more inexplicable as the foot of the mountain was passed in returning from Eanedeh (Scamandria) to Alexandria.

The vaunted discoveries of Agamemnon's Altar of the Twelve Gods at Cape Lecton, and of the Altar of Idæan Zeus upon Mount Gargaros, can only provoke a smile. The former, visited by the present writer before this notoriety was attached to it, is a formless mass of masonry piled up of small stones at no early date; the latter, according to Schliemann's description, is an isolated slab, bearing the marks of dowels, less than three feet long, and altogether unfitted for the imposing rôle assigned it.

The remarks concerning Assos—a site specially interesting to Americans from the systematic investigations now being carried on by the Archæological Institute—are meagre and commonplace, presenting nothing not already given in the accounts of earlier travellers, save only the statement that "three or four temples occupied the highest point of the acropolis, where their positions are plainly to be seen." The excavations have as yet revealed only one building within the entire enclosure of the citadel, and it is certainly fortunate that the attention of those in charge of the work should be called to this remarkable oversight. Two or three temples more upon the acropolis of Assos,

besides the imposing Doric structure described at length in the recently published report, would form a most interesting complex of sacred edifices.

Schliemann travelled through the country on the beaten roads; his long journey does not seem to have taken up quite two weeks, and in the few hours allowed each site he could only make the most hasty and superficial surveys. His statement that between Chrysa, Lecton, and Assos there is no trace of an ancient settlement, is an error. Although the region has by no means been thoroughly explored, the walls and altars of Polymedion have been discovered halfway between Lecton and Assos, and similar vestiges of antiquity could without doubt readily be found between Lecton and Chrysa, the coast there not being traversed by bridle-paths. To assume the foundation of the important town of Baba to have necessarily been simultaneous with the erection of a fountain and a gate at that place, is unsatisfactory; the more so as the author invariably miscalculates Turkish dates. The year 1193 of the Hegira is by no means 1776 of our reckoning; nor is 1101 our 1685. Schliemann's method of determining these periods was evidently to subtract the given sum from 1298, and to take the result in turn from 1881—the Gregorian equivalent of Heg. 1298. It would be well for the ingenious Doctor to note from any chronological table the considerable difference between lunar and solar years. With him, as with the unlettered inhabitants of the country, all later Byzantine ruins are Genoese, though it is more than questionable whether the Gattilusii even gained a foothold in the Troad at the ports nearest their sovereignty of Lesbos, and Genoese princes never could have erected the ramparts and citadels of the eastern interior thus attributed to them. The similarity of the common village name Araclu to an imaginary Greek city Heracleion, hardly suffices to prove the existence of such a place, in the lack of all other evidence; the *red* village Kizil-ketchily though "recognized immediately" by Schliemann as retaining a reminiscence of the Greek Killa, is wholly Turkish, and it is not clear how the name Devrent can be claimed as a corruption of Antandros.

To note other misstatements, and refute other vague theories, would require more time and space than the book appears to justify. It is with difficulty that a passage tolerably free from error or groundless assumption can be picked out, although those parts of the volume relative to the immediate vicinity of Troy, and taken in part from the author's 'Ilios,' are the most concise and striking. The review of the Trojan Plain, notwithstanding its exaggeration, is noteworthy as a comparison of the past and present conditions of the land:

"Apart from the five prehistorical cities and the Lydian town, the débris of which was found beneath the ruins of the classical Ilion at Hissarlik, apart also from the three prehistoric cities—at the tumulus Beshika-tepeh, on the right bank of the Scamander opposite Bunarbashi, and on Hanay-tepeh—there were once two villages and eleven flourishing cities in this Plain of Troy, which is scarcely fourteen kilometres long, and averages only six kilometres in width. All of these were autonomous, and five possessed an independent coinage. When we think that these two villages and eleven cities existed side by side in antiquity, and that one of the latter had a population of at least 70,000 souls, we are astonished that so many human beings could find sustenance in a plain where to-day the inhabitants of seven miserable villages are scarcely able to supply their scanty needs."

The volume closes, as it began, at Troy, and its defects are easily forgiven by the reader thus reminded of the years of personal hardship and pecuniary sacrifice spent by Schliemann in the trenches of Hissarlik. Every spadeful of earth upturned from the fruitful soil of Asia Minor brings new materials for the ethnographical and archæological studies of the chamber-scholar, and Schliemann has sifted whole hills. His fame as an energetic and persevering excavator is only discredited by his own publications, and the gratitude which is due to him for the direct results of his work is not diminished by the admission that his theories and writings are well-nigh worthless.

BISMARCK AND HIS OPPONENTS.

Fürst Bismarck und NICHT *seine Leute während des parlamentarischen Kriegs.* Zeitgeschichtliche Spaziergänge von Dr. Wolfgang Frank. Leipzig. 1882

Dr. Frank's 'Fürst Bismarck' is not likely to attract as much attention as Dr. Moritz Busch's 'Graf Bismarck und seine Leute während des Kriegs mit Frankreich,' of which it is in a limited sense an imitation. It does not pretend to be a book of revelations, and hardly contains anything that has not been known to those who have followed with interest the parliamentary course of the powerful Chancellor through all its windings. It offers, however, in a very pleasing form, ably grouped reflections of the varying aspects of that course, so rich in changes and yet strictly continuous; and, though perhaps rather intended to amuse than to instruct, and done by a delineator not entirely free from a friendly bias, it has the value of a pretty faithfully executed historical picture. Readers not sufficiently familiar with Bismarck's oratorical or conversational outpourings cannot fail to enjoy the multitude of his sayings here compiled—some epigrammatically wise or politically important, some moody, bitingly sarcastic, or cynically provoking, but all pithy and indicative of power, wayward independence, and intellectual exuberance. The more fugitive sketches of those German parliamentary leaders who are *not his* men—though many of them are by turns his allies—such as the Progressists Richter, Schulze-Delitzsch, and Hänel, the National Liberals Lasker, Bamberger, and Bennigsen, the Socialist Bebel, and the Ultramontane chief Windthorst—will also be found interesting, and still more so the pages referring to the apostle of Socialism, Lassalle. If Dr. Busch's communications are more piquant and original, Dr. Frank's are more strictly authentic. Like the former, the latter mainly reproduces talk; but what he reproduces is generally characteristic of personality or political evolution and relations. Thus we hear Eugen Richter say in the Reichstag, on October 14, 1878:

"Questions of power are always the main thing with the Imperial Chancellor. In the field of foreign affairs he well knows how to achieve great results by skilful dealing. His defect is, that he makes the question of power the foremost one in domestic politics also, and that he uniformly treats internal questions in subordination to it. As toward foreign states, so toward parties at home, he assumes now a friendly, now a hostile, attitude; just as the momentary internal relations of power make it seem expedient to him. Now he receives the leader of the Socialists as he would a neighboring landlord; now he persecutes with all the might of the state those who offer less resistance than himself to the seductions of that Socialist. The leaders of a third party are at one time celebrated by the Chancellor's press as the best of patriots, and soon after denounced as selfish office-seekers. Between friendship and hostility the Chancellor observes the method of dilatory treatment. Since Benedetti's time he has treated party leaders at home, too, with dilatoriness. At this moment, if I understand things aright, it seems to be Windthorst-Meppen's turn."

"It is evident," says the same orator two years later, "that the Chancellor is bent on having a great Bismarck party *sans phrases*—a 'middle party,' as he likes to call it—because he would be the centre of it, both in speech-making and in acting. He becomes more and more intolerant of opposition: formerly he wanted only protection against abuses of freedom of speech, but now eloquence itself is repugnant to him." The last phrase is in allusion to a *mot* of Bismarck's, who mockingly applied to Richter the title of "his Eloquence." The Chancellor is much more friendly toward Lasker, whom he often picks out in great debates as the foeman most worthy of his steel. He designates him as a veteran opponent in regard to whom one can say, "in the words of that old French song, 'On se rappelle avec plaisir des coups de poing qu'on s'est donnés.'" In the same speech, however, carried away by his unbridled wit, he mocks at the financial policy of the Jewish lawyer, who is known to be blessed with much less worldly than intellectual wealth, as a policy *non habentis:* "He belongs to those gentlemen who, in the framing of our laws, at every stage of law-making, form the majority; who, as we read in Scripture, neither sow nor reap, neither toil nor spin, and yet are clothed—I will not say how, but clothed they are." He was more seriously malicious when, in 1867, he advised an opponent who criticised his action in the great international struggle of the preceding year to read a certain scene in the first act of Shakspere's "Henry IV.," in order to find out what he, the author of Sadowa, must feel when he heard such talk about things which he "suffered and fought for, and ought to know better." The words referred to are those of *Percy Hotspur's*, which, to understand the scathing sarcasm of the reference, must be read in full:

—"I remember, when the fight was done,
When I was dry with rage and extreme toil,
Breathless and faint, leaning upon my sword,
Came there a certain lord, neat and trimly dress'd,
Fresh as a bridegroom. . . .
With many holiday and lady terms
He questioned me. . . ."

Characteristic of the Chancellor's highest aspirations as a statesman are the following words, spoken in July, 1879:

"No matter whether I suffer defeats in my course, whether I must begin the work anew—as long as I am Minister I will not relax my efforts; my model in this is Robert Bruce in the story of the spider, in whose climbings-up after falls he found encouragement not to give up, on his part, even under the worst auspices, that which he deemed right and useful for his country. . . . As far as I am concerned, I will walk in the path which I recognize as the right one in the interest of the Fatherland, to the very end undisturbed—whether I earn hatred or love for so doing."

Even before he became Imperial Chancellor he spoke with the same proud and inflexible self-consciousness as in 1879. "As long as I remain Federal Chancellor and Minister of Foreign Affairs, our state policy must be shaped according to my understanding; and if you put stones in its path, and clog its wheels, you obstruct that policy, and the responsibility for such obstruction, even for the untimely compulsion to declare myself—the responsibility for the consequences—rests with you, the authors of motions and speakers, and not with me." The following anecdote ("it is told") also belongs here: Bismarck was asked to write a few words in an autograph album. He chose a page which contained lines by both Guizot and Thiers. Guizot had written, "Dans ma longue vie j'ai appris deux sagesses: l'une, c'est de beaucoup pardonner, et l'autre, de ne jamais oublier." Thiers had subjoined, "Un peu d'oubli ne nuit pas à la sincérité du pardon." Bismarck added, "J'ai appris dans ma vie à moi de beaucoup oublier et de me faire beaucoup pardonner." What the Chancellor most easily forgets, or discards, is maxims of policy and political affiliations, which

he changes almost like clothes; and what he needs most forgiveness for is that very discarding and changing. And yet he constantly and consistently labors for one grand aim, the establishment on a firm basis of Germany's controlling power in the centre of Europe; and as long as this remains also the paramount and categorical demand of his nation, all his sins against consistency, right, or freedom will be forgiven by it, and the most energetic protests of political leaders and their constituencies be little more than honorable but idle displays of fidelity to higher principles.

The Life of George Cruikshank. In Two Epochs. By Blanchard Jerrold. New York: Scribner & Welford. 1882. 2 vols., with numerous illustrations.

THERE is a hint in this title of chronological observance, but Mr. Jerrold shows no capacity for dealing with any division of time smaller than "epochs." His dates are very loosely kept, and his annoying repetitions likewise betray a temporal disorder. Again and again he recites the story of Cruikshank's wilful bad etching for Bentley, and the artist's saying that "a man should paint from his shoulder, sir"; the drunkard paying his week's score is served up (vol. ii.) on p. 78 and p. 90; the "British Bee-Hive" described on p. 211 is redescribed with absolute unconsciousness on p. 217; and even in the lucid intervals of memory, "we have seen," or "as the reader has already learned," introduces the twice-told tale. To this add extreme slovenliness in composition. An entire paragraph on p. 107 (vol. i.) clearly needs to be inserted on the preceding page; for want of a comma, the final sentence on that page (106) is seemingly left incomplete; for want of a dash, that on p. 136 (vol. ii., quoted from Mr. Wedmore) is broken senselessly in two. One comma too many on p. 26 (vol. i.) gives Isaac Cruikshank three sons instead of two—"Robert, Isaac, and George." On p. 31 George's brother is called "I. R.," and on p. 63 "Isaac Robert," as is right; yet on p. 124 he is styled "Robert Isaac" again. So the late R. Shelton Mackenzie is referred to as "K. S." on p. 85 (vol. i.) and "R. S." on p. 218; and the proprietor of the *Meteor*, who is "Earle" on p. 106, becomes "Earl" on the opposite page. Page 106 has been particularly uncared for, since in addition to the errors already noted must be cited "Lanfray" for "Lanfrey."

It may be said that for much of this inaccuracy the (English) printer should be held responsible; and this is no doubt true, as it is that no American book of equal typographical pretensions and expensiveness would be found so disfigured with blunders which ordinary proof-reading should have avoided. There are, however, numerous other traces of Mr. Jerrold's inattention to the details both of authorship and of bookmaking. We will only particularize further the bibliography in the appendix, which is so far from being complete that even a work like the 'Queen's Matrimonial Ladder' (1820), expressly mentioned in the text (vol. i., p. 95), is omitted from the "List of Works Illustrated by George Cruikshank"; and the absence of any index.

It is one thing, however, to be repelled by a writer's want of care and method in the presentation of his subject, and another to be unrepaid by a perusal of his work. No essential feature, we are sure, of Cruikshank's personality has been overlooked by his present biographer. His slight but not insignificant figure, his elastic step, his inexhaustible animal spirits, his physical endurance (we see him dancing a hornpipe at eighty-four), his almost unexampled industry and productiveness; his voice, flexible for mimicry or histrionic delivery, and of impressive solemnity when depicting the woes of drunkenness; his early conviviality, his conversion to total abstinence and devotion of tongue and pencil to the crusade against intemperance; his amiable conceit, leading him to disputes as to originality with Ainsworth and Dickens; his bad judgment in literary ventures; his costly and mortifying illusions as to the interest in him and his works of the generation to which he was a grandfather—all these traits emerge from the confusion of Mr. Jerrold's narrative, and combine to give a just idea of the wonderful old man who joined in the British caricature of Napoleon I. and outlasted Sedan and Napoleon III., and still had five years of life and of work in him. The two "epochs," however, are not treated with equal sympathy and knowledge by Mr. Jerrold. The first is that in which Cruikshank achieved his enduring fame as a designer, having no other aim than to support himself with his pencil; the second that in which the artist was nearly lost in the reformer, and the alleviation of human misery from a single evil became the mastering purpose of the remainder of his days. It is no discredit to Mr. Jerrold to say that he displays more sympathy with the temperance advocate than with the caricaturist who up to 1847 carried a free lance. His observations on Cruikshank's earlier designs are those neither of the connoisseur nor of the collector, and for the most part he is content to repeat the eulogies of others. He defends "The Bottle" against Dickens's absurd criticism with a true artistic as well as moral insight; but he accounts for the inferiority of these designs by the process (glyptography) employed, overlooking the *scale*, and hence missing the general observation that Cruikshank, unlike his elder contemporary caricaturists, belonged among the "Little Masters." In this respect he resembled Bewick, and both might have taken as their motto Ben Jonson's line—

"In small proportions we just beauties see."

Like Bewick, again, he was, as Mr. Wedmore points out in a review of this book in the *Academy*, a delicate and admirable water-colorist, though Mr. Jerrold makes no mention of it. Finally, Cruikshank's Scottish parentage might have suggested a vindication of that much-abused stock on the score of humor, particularly as Gillray had the same derivation, and Bewick, no mean humorist in his way, was a Borderer.

We quote, as the most favorable specimen of Mr. Jerrold's writing, the following passage relating to the public indifference to Cruikshank and his huge oil-painting, the "Triumph of Bacchus" (vol. ii., p. 160):

"I remember seeing him standing in his exhibition room. It was empty. There was a wild, anxious look in his face when he greeted me. While we talked, he glanced once or twice at the door, when he heard any sound in that direction. Were they coming at last, the tardy, laggard public for whom he had been bravely toiling so many years? Here was his last mighty labor against the wall, and all the world had been told that it was there. His trusty friend Thackeray had hailed it in the *Times*. A great committee of creditable men had combined to usher it with pomp into the world. All who loved and honored and admired him had spoken words of encouragement. Yet it was near noon, and only a solitary visitor had wandered into the room. Thackeray might well say, 'How little do we think of the extraordinary powers of this man, and how ungrateful we are to him!'

"I was reminded of a visit I had paid years before to a room in the Egyptian Hall, where Haydon, wild and lowering, lingered by his pictures, a solitary, almost heart-broken man. In a letter he said that Douglas Jerrold was one of the two or three who answered his summons to Piccadilly. But it was I, then a young art-student, who had begged my father's ticket, and stood for him in the empty Haydon gallery. It was thus, with a sinking at the heart, that I went away from Wellington Street."

Readers of *Scribner's Monthly* will not fail to observe that Mr. Jerrold has secured for his book almost all the plates which illustrated Mr. Russell Sturgis's paper on Cruikshank in that magazine for June, 1878. They will also notice the forcible retrenchment of some of them to fit the page, and the great superiority of the American over the English press-work. They will, moreover, after laying down Mr. Jerrold's two volumes, find that they can re-read Mr. Sturgis's seventeen pages with interest and profit.

Ralph Waldo Emerson. In Memoriam. Personal Recollections and Extracts from Unpublished Letters. By Alexander Ireland. London: Simpkin, Marshall & Co. 8vo, pp. 120.

MR. IRELAND'S little volume in memoriam of Mr. Emerson is an English tribute to the unobtrusive but cosmopolitan influence of the great poet. It deals especially with Mr. Emerson's European relations, and contains a number of his letters, which add little, however, to our knowledge of him. Mr. Emerson had, as he himself said, a "chronic and constitutional reluctance to writing a letter," and these epistles to Mr. Ireland are little more than notes of introduction and the like, worth preserving, but hardly of consequence enough to print. There are, nevertheless, some interesting passages in the accompanying letters to Carlyle. In 1859 he writes of his home life: "I am fooled by my young people, and grow old contented. The heedless children suddenly take the keenest hold on life, and foolish papas cling to the world on their account as never on their own." The passage about the war, written in 1862, can hardly have softened the intolerance of the harsh Scotchman: "The war is our sole and doleful instructor. All our bright young men go into it to be misused and sacrificed by incapable leaders. . . . Unless backed by our profligate parties, their action [the interference of England or France] would be nugatory, and if so backed, the worst. But even the war is better than the degrading and descending politics that preceded it for decades of years." Later on, however, in 1864, he wrote: "I shall always respect the war hereafter. The cost of life, the dreary havoc of comfort and time, are overpaid by the vistas it opens of eternal life, eternal law, reconstructing and uplifting society—breaks up the old horizon, and we see through the rifts a wider." Of Carlyle's 'Frederick the Great' he writes to him: "The book was heartily grateful, and square to the author's imperial scale. . . . I find as ever in your books that one man has deserved well of mankind for restoring the scholar's profession to its highest use and dignity. I find, also, that you are very wilful, and have made a covenant with your eyes that they shall not see anything you do not wish they should. . . . My joints ache to think of your rugged labor."

It was natural enough that Mr. Emerson should dislike letter-writing, whose easy familiarity was contrary to all his habits of work. The Orphic saying was the type of all his writing. His thought was controlled by the ineffable mystery of language. He did not marshal his sentences in ordered ranks to reach a desired end. He took a phrase and expanded its mystic meaning. The sentence was the ultimate unit. Paragraphs might be and were interchanged without affecting the character of the essay. It would be a great mistake to overlook the philosophy in which he viewed them, for with profound insight he had entered the innermost temple of absolute being, which we also must penetrate if we would rightly see the treasures of his thought. But he expressly ab-

jured any systematic construction. He was a lapidary, not an architect. With his graver he set free the perfect image hidden in the gem. He gave the antique faith its choicest crown of jewels, but he spent no time on what he thought the superfluous labor of strengthening its foundation. It will naturally be asked why the style of one who worked so laboriously at verbal form was not better. But its worst faults, its brusqueness and incoherence, arose from the nature of its piecemeal construction, and were not faults in his eyes. The baldness of some of his verse was due partly to the indifference of his ear; deafness it cannot be called, since the harmony of his best lines is as fine as anything in literature. But he had the carelessness about mere form which belonged to the Nature school from which he took his soaring flight—a school which, in its reaction against the over-formality of the time, easily drifted into painful prosiness. Literature is always oscillating between the extremes of unnatural art and inartistic nature, and he was on the crest of the wave. Fortunately, Mr. Emerson revised his work so thoroughly that he printed little that he could improve. It would be a pity to print the great mass of more shapeless matter which he is said to have left, fine as some parts of it doubtless are.

There is little that is new to American readers in Mr. Ireland's account, except, perhaps, the description of Clough's greatest achievement as the "Bothie of Toper-Na-Fuosich" (*sic*). One anecdote is worth repeating. After a commencement address by Mr. Emerson to a Middlebury literary society, a Massachusetts clergyman rose to conclude the service with prayer, and used in it this sentence: "We beseech thee, O Lord, to deliver us from ever hearing any more such transcendental nonsense as we have just listened to from this sacred desk." After the benediction Mr. Emerson asked his next neighbor the name of the officiating clergyman, and when falteringly answered, with gentle simplicity remarked: "He seemed a very conscientious, plain-spoken man," and went on his peaceful way. Father Taylor took a broader view of the young comeouter: "If the tree is good and the fruit is good, why should we complain because the bark is bitter?" And again, at another time: "If Mr. Emerson goes to hell, he will give it a very different atmosphere," a remark which we commend to the attention of the Reverend Bishop H.

South Mountain Magic: A Narrative. By Madeleine Vinton Dahlgren. Boston: James R. Osgood & Co. 1882.

FOLK-LORE is becoming so voluminous that those who have been most forward in promoting the study are growing desperate over the mass, and every new candidate for consideration in this department must expect a severer scrutiny. Obvious variants of the old stories, and literary manipulations of popular legends, find little mercy at the hands of serious students, and Mrs. Dahlgren's book is composed so largely of old material, and that old material so sophisticated with fine writing, that 'South Mountain Magic' will not be of any essential service to the anthropologist. It is but fair to say, however, that Mrs. Dahlgren probably never thought of the anthropologist when she was getting up her book, which produces on an outsider the effect of having been written chiefly for the delectation of a coterie. It was no doubt a surprise to the writer that so much superstition should survive in a region so near the capital of the nation, but few who know the mountain portions of the Southern and Middle States will share her surprise. "Black dogs," "white women," "headless men," "doublegangers," witches, wizards, brought over from the old country, linger everywhere among mountaineers, especially among those of German descent.

The last chapter, which treats of "Magic Cures," is the best, because it is the most matter-of-fact, and some of the bits of dialect are fairly done; but the eloquent portions of the volume are unendurable. The reflections in the descriptions might have been tolerable in the old days when a certain courtesy was due to any lady that chose to write; but we have done away with the word *authoress*, and the most cultivated of society women, when they venture into print, must use normal grammar, avoid stale quotations, lop off superfluous adjectives, and verify their little allusions—or bear the penalty. Feminine syntax is often delightful, it must be granted, and floating participles and unattached pronouns lend a peculiar charm to the conversation of women; but it is almost a sin to puzzle the masculine intellect with such a sentence as this, which is found in Mrs. Dahlgren's preface: "Growing out of a familiar acquaintance with their habits of thought and action, the writer gradually learned their superstitions and heard the various narratives to be found in this book." And there are others like it, though none equal to it. A book constructed in this way is anything but light summer reading. Such an audacious figure as "Death's portals alone lift the veil that shrouds the future" is worse than any of Mrs. Dahlgren's ghost stories, which singularly fail to frighten one. It is worse even than the "wraith" of our old enemy Simeon Stylites, who masquerades in this volume as St. Simon of Stylites. This minute criticism of style will seem misplaced, but part of it is due to the disappointment of the critic. The local vein, properly worked, has yielded valuable results. Mrs. Dahlgren's Michael Zittle, in proper hands, might have given us something distinctly valuable, just as 'Uncle Remus' has been a substantial addition to our collection of types; but the author of 'South Mountain Magic' has not taken the trouble to work up her studies.

Etymological Dictionary of the English Language. By the Rev. Walter W. Skeat, M.A., Professor of Anglo-Saxon in the University of Cambridge. Oxford: Clarendon Press; New York: Macmillan & Co.

PROFESSOR SKEAT'S Dictionary, lately brought to a conclusion in the covenanted space of four years, may certainly be allowed all that the author in his modest and candid preface claims for his book: those whose philological knowledge is but small may do worse by going elsewhere for information. Indeed, this dictionary is decidedly the best existing compendium of what has been determined or conjectured as to the derivation of the most important English words. It is considerably more than a laborious and critical compilation, for the author's extensive knowledge of the earlier English and his own keen etymologic scent have enabled him to make important discoveries. So that, even leaving out of account the very instructive minutes illustrating the use and history of words, this dictionary has advantages over its only rival in the way of historical etymology, the soberly scientific work of Eduard Müller. An inspection of a few specimens, taken almost at random, as *gewgaw*, *imbecile* (not in Müller), *lollard*, *swamp* (slurred over in Wedgwood), *swine*, *tram*, *trinket*, will serve to show the improvements and the characteristic excellences in Prof. Skeat's book. One thing might, however, have well been made plainer. We are told that the book "is not intended to be always authoritative, nor are the conclusions arrived at to be accepted as final." But there can be no doubt that many whose philological knowledge is but small, schoolteachers (who often attach an exaggerated importance to etymology), by hundreds and thousands, will consult this book. The author thinks that such people "may safely accept the results here given, since they may else do worse." It is very clear that no one can be safe in accepting as authoritative an enunciation not meant to be final, even though he might do worse. Things settled and things not settled should be distinguished. A general warning in the preface that etymology is very uncertain ground, will not avail.

An unabridged edition of this book has been printed for the American market, of which the price is two dollars and a half and your eyes. It may be questioned whether the publishers have a right to punish a possible readiness to buy a possible American reprint so severely. Or is it only that the English wish to be neck and neck with us in the race for making the world near-sighted?

An abridged edition, called 'A Concise Etymological Dictionary, etc.,' has been issued by the Clarendon Press, and in this country bears the imprint of the Messrs. Harper among their "Student Series." It is irreproachable in the matter of print, and, what is more, has been condensed by a thorough rewriting. Of course, too, it has had the benefit of the author's latest corrections and improvements, including a feature not engrafted on the larger edition—viz., the arrangement under what we may call a root-word of its various derivates in alphabetic order. These, while tolerably obvious in the case of compounds, are sometimes very obscure, and their being brought together in connection cannot fail to be instructive.

Capital and Population: A Study of the Economic Effects of their Relation to each other. By Frederick B. Hawley. D. Appleton & Co. 1882. 8vo, pp. 267.

THERE is a growing disposition at the present time to regard abstract writing in political economy as worthy less consideration than carefully-compiled facts or trustworthy historical study; and indeed the belief that some great law has been discovered is the only apology likely to be accepted for this kind of writing. It is an apology of this nature that the reader is called upon to grant the author of 'Capital and Population' for having added another work to the list of abstract economics. The book is given to the public in firm confidence that it is an important addition to economic literature. "The economic law I have attempted to establish," says Mr. Hawley, "equals in its influence upon economic conclusions any hitherto ascertained. Granted its truth, it throws new and decisive light upon nearly all the unsolved problems of the science." The reviewer has no choice left him, after such a claim, but to ask what this newly-discovered relation between economic forces and factors may be, which promises to revolutionize so conservative a study as political economy.

So far as it is capable of concise statement, this law is "that capital is limited by population, and tends constantly to overpass such limit." This, it will be observed, is exactly the converse of what English economy teaches, from which one learns that population is limited by capital, and presses always upon the means of subsistence. Yet Mr. Hawley confesses himself a disciple of Ricardo and Mill, and asserts that he has simply applied the premises which those writers accepted with more strictness than they themselves applied them. This failure on their part, however, is "due not so much to the want of logical acumen as to the fact that there was nothing in their surroundings to suggest further

pursuit." As to the question of population, this book fails to include all the necessary factors, and in consequence to satisfy a close observer; but, on the other hand, what is said of the workings of capital in an industrial society formed like that of the present must be regarded as well said from the author's standpoint, and as important in itself, since it points out certain errors which crept into Mr. Mill's writings, and which have formed part of the accepted teaching upon capital ever since. Among the secondary doctrines of capital which are here controverted may be mentioned the following: That one who saves and builds a capital fund is the only true friend of the workingman; that over-accumulation is impossible; that panics are the effect of extravagance and an indication of poverty on the part of the people among whom they occur, and—perhaps the most significant of all—that demand for goods is not a demand for labor.

While we cannot follow the author in his entire course of reasoning, it is possible to state concisely the line of thought by which he arrives at his conclusions. Accepting the usual definition of capital, that it is the product of past labor devoted to further production, it is conceived as divided into two funds; the one being "active," the other "dead" stock. Ricardo makes no such distinction, but argues as if all capital at any time in existence is applied to productive purposes. Mr. Mill admits the distinction, when he is talking about capital, but is charged with forgetting it and using the word in the Ricardian sense when he employs the conception in argument. "This distinction," says our author, "is of the utmost importance," and his book is in reality but a study of the influence which the existence of "dead stock" has upon the activity of "active stock." Thus he contends that intensity of industry, remuneration to labor, influence of capital on population, actual rate of profit, and the like, do not depend upon the total amount of capital, but upon the proportion of capital which is active to that which is inactive. The greater the amount of active capital at any time, the more prosperous is the community; but this is a different thing from the statement commonly made that the test of prosperity is the total amount of wealth saved. Activity in business circles varies inversely with the proportionate amount of dead stock seeking investments, for all business is undertaken for profit, and, given a large amount of dead stock seeking investments, the profit upon stock already invested must be low. This leads the author directly to the conclusion that, while too much cannot be produced, too much of that produced may be saved, and that the thing necessary, in order that a community may continue in uninterrupted production, and escape business depression, is to keep down to a normal proportion the amount of dead stock. While not admitting this practical conclusion, one may say that the criticism here presented upon the general doctrine of capital-saving is clear-cut and logically accurate, and bears with it all the more force because it comes from an avowed disciple of Mr. Mill.

The remainder of the book contains but further application of this distinction between active and dead stock. The chapter upon "Capital and Labor" ingeniously points out the fact that there is no such thing as real unity of interests among laborers as against employers, but that while each individual laborer holds conflicting interests with his own employer, his true interest—so far as real wages are concerned—is identical with that of the employers of other laborers (p. 130). The author believes, also, that his law is able "to undermine the fundamental premise of free trade so far as distribution is concerned," and will in consequence commend itself to many interested readers. This book will well repay study. It brings the doctrine of capital to the foreground as the fundamental conception of modern industrial methods. It is not, however, a satisfactory statement of that doctrine, as indeed no statement can be which does not depart more decidedly from the teachings of Ricardo and Mill than the author appears to feel himself at liberty to do.

An Engineer's Holiday; or, Notes of a Round Trip from Long. 0° to 0°. By Daniel Pidgeon, 2 vols. 8vo. London: Kegan Paul, Trench & Co. 1882.

THE title of this work is slightly misleading: at least, we expected to find Mr. Pidgeon viewing the countries through which he passed from a professional standpoint. Had he done so he might have produced a work of some value both to his own countrymen and to ourselves. As it is, with the exception of a few passages, chiefly in regard to railroad bridges, we have simply the record of the ordinary impressions of a not very well-informed or acute observer during a hasty journey round the world. Considering the fact that he never left the beaten track, and that he had no noteworthy adventures, the giving these two volumes to the public is a proof rather of his courage than of his wisdom.

Mr. Pidgeon's holiday lasted for a year, five months of which were spent in the United States, the greater part of the remainder being devoted to Japan and India. He landed at New York in the spring of 1880, and after a few days spent in the "industrial cities," Philadelphia, Washington, Pittsburgh, and Chicago, went to the mining regions of Colorado and Nevada. This very slight acquaintance with the Atlantic States from personal observation makes his very confidently pronounced judgments upon our life and institutions rather amusing reading. He says, for instance, that he "searched the booksellers' shops of New York without success for a compendious geological handbook of America—a *vade mecum* such as Ramsay has given us for England"—and then goes on to remark that "the absence of such a book is only one among many indications of the neglect with which science is generally treated in America." One would suppose from this that the two countries were of equal size, and that the Sierra Nevada was as accessible to the geologist as the Chedder Cliffs. In another place he refers to the lack of "intellectual aspiration" in this country. This may be true enough, but would not the American whose knowledge of England was limited to that derived from a few days' stay in Liverpool, London, Manchester, Birmingham, and Sheffield, and two months spent in Cornwall or the Black Country, find it equally true of England? His general opinion of the United States is given in the following sentence: "For sensitive men, bred in the refinements of the best European society, the less exclusive habits, less elegant life, and less polished manners of the States form a purgatory; but the country is the paradise of the artisan."

At times we cannot help suspecting that our author has been made the victim of a too eager desire to find strange things among us. As an illustration of the "gallantry toward women for which America is famous," he says that "with a touch of her fan or parasol, a lady may indicate to a perfect stranger that she desires his seat in a concert-room or an omnibus. When this is yielded she may take it without thanks." Writing of a "tremendous dinner" given at the opening of the Chautauqua Lake Sunday-School Assembly, he says, on the authority of a waiter, that the eighty-six dishes on the *menu* "were honestly partaken of, dish by dish, by many excellent Methodists." This same waiter, referring to the models of scenes of Old Testament history to be found in the grounds, gave Mr. Pidgeon a cordial invitation to visit Chautauqua during the session of the Assembly. "'Many a time,' said this Amalekite, 'I hev sot on Sinai with a "tony" gal, and watched the old patriarch work Horeb.* Ef you'll come hyur and see the machine running in August, mister, I guess I'll fix you in the best room on Ararat; thet ark is kep' for high-toned company, and you'll hev a good time, you bet. Why, there's just a thousand gals flirting at you as soon 's your nose is inside thet amphitheâtre.'" We fear, also, that the man who told him that "going 'gunning with a smell-dog' is good Yankee" was making game of him; as well as the American who in Oxford asked him, "Do you think I might shunt York Minster on my way to the North?"

For one of our industries, bridge-building, the English engineer has unqualified praise. In it, he says, "labor is economized in a manner of which we know nothing in England. Indeed, we have no establishments at all similar to those in which the beautiful trussed girders of American railroads are made." When he reaches the mining regions, the narrative becomes more interesting. At Leadville, he tells us, "a wide space of ground, several acres in extent, is entirely covered by empty meat-tins. The mining camps of the West depend on canned provisions, but, in spite of a now intimate personal acquaintance with this useful form of food, the stretch of tin-drift, glittering like a great mirror in the sun, and diversified with blackened tree-stumps, was a surprising spectacle." A deserted mining town is well described in the following passage: "The stage passes through towns of weed-grown streets and empty houses, whose doors swing wide, whose windows are broken and unshuttered, and within whose desolate rooms furniture too bulky for easy removal still stands. Here is the post-office, with dusty racks holding a few unclaimed letters; and there the saloon, with its billiard-tables still in place, but abandoned as if a sudden panic had driven away the people."

Of Mr. Pidgeon's travels in the East little need be said. This, however, is new to us—that in Japan "a horse is not allowed to drink out of a pail, but the water is thrown into his mouth by means of a wooden ladle." In this country the "ameya" is very popular with the children.

> "This clever stroller's stock-in-trade consists of a little bench, furnished with a lamp, some plastic sugar, red and blue pigments, a few twigs of split bamboo, and a pair of scissors. Taking a lump of the sugar in his hands, he makes a funny speech to the parti-colored little crowd, and ends by asking what it is their pleasure he shall produce. 'A dragon,' shouts some bold little beauty, while a murmur of approbation arises, and every eye is fixed on the artist. Little by little, the terrible creature grows out of the paste, a collection of unrelated details at first, which a few sudden touches complete as if by magic. Now some one calls for a gourd, another for a tortoise, a third for a man on horseback, and a fourth for a monkey swinging by its tail. It is a contest between the children and the old man, but they cannot nonplus him, try how they will. No matter what they call for, the ameya is equal to the occasion, and within three minutes his dexterous fingers conquer every difficulty which his audience may propound."

For the Indian jugglers, on the other hand, our author expresses an unbounded contempt, the best not being equal to "third-rate European conjurors." A not inconsiderable portion of the two volumes is taken up with scraps of history which have the appearance of being borrowed from a guide-book or an encyclopædia. At

* Drawing water from the rock "by means of a cleverly-hidden tap and the teacher's wand."

times they are inaccurate, and they are almost always unnecessary for the intelligent reader. In one chapter Mr. Pidgeon discusses at some length the Chinese question, and in another the relations of England to India; but in neither case does he contribute anything of value to the subject.

A Treatise on Rivers and Canals: Relating to the Control and Improvement of Rivers, and the Design, Construction, and Development of Canals. By Levisen Francis Vernon-Harcourt. 2 vols. Oxford: Clarendon Press. 1882.

THIS book, which is based upon a course of lectures delivered by the author on river and canal engineering, professes to present in a simple and concise form descriptions of the principal and most recent works on rivers and canals, and the principles on which they are based. It takes up in a superficial way not only those improvements which relate to navigation, but various incidental works which are met with on rivers, including apparatus for dredging, different varieties of foundation work, and drawbridges. It has neither the merit of a systematic treatise from a professional point of view, nor the statistical completeness which would render it a good article in a cyclopædia. More space is devoted to the improvement of tidal rivers than to any other topic, and it is to be hoped that this branch, with which an English engineer ought to be especially familiar, is free from the defects which are prominent under other heads. The treatise purports to give a fair consideration to American as well as European works, but the author's evidently honest intention has, either from ignorance or from carelessness, been singularly thwarted.

Canals are divided in a somewhat arbitrary manner into inland and ship canals. The Erie Canal is classed with the former, as it should be; the Languedoc Canal, whose capacity is inferior to that of the Erie, its locks smaller and more numerous, and its summit-level more elevated, is called a ship canal, the only reason assigned for this singular distinction being that the Languedoc Canal joins two navigable rivers which flow into different seas, while the Erie Canal does not. The author entirely omits from the list of American canals all those in Ohio and the Western States, and also the canal at Sault Ste. Marie, through which the entire traffic of Lake Superior has been conducted for nearly thirty years, and on which the largest single lock in the world is now in successful operation. More remarkable, however, than these deficiencies is the description given (page 399) of a lock constructed by M. Caligny at Aubois, in which, by an application of the principles of the hydraulic ram, the waste of water is very largely reduced, the saving, according to Mr. Vernon-Harcourt, being forty per cent. in filling the lock, and also forty per cent. in emptying, a total saving in both operations of eighty per cent! These percentages suggest a very important improvement: the lock should always be emptied and filled twice, the result of which would be that, instead of losing water, no less than sixty per cent. of the entire volume of water in the lock would be raised from the lower to the higher level of the canal, and a series of locks operated on this principle might make it practicable to introduce canals in regions where there is no supply of water for the summit-levels.

A less absurd but perhaps even more inaccurate statement is found in the portion of the last chapter of the book, which is devoted to the improvement of the passes of the Mississippi River. The description of this very important improvement, evidently condensed from Mr. Cothell's work, gives a reasonably accurate account of what was actually done. The improvement was made at the South Pass, which discharges only about one-eighth of the entire volume of the Mississippi River; the effect of contracting the outlet of this pass was soon felt in a reduced discharge, accompanied by an increased discharge through the larger passes, and it became manifest that in order to maintain the necessary discharge at the South Pass any enlargement of the other passes must be stopped. For this purpose submerged mattress sills were placed across the great passes near their heads, the effect of which was in no wise to decrease the flow through the great passes, but simply to prevent their enlargement by scour, the sills being so far below the surface that they did not in the slightest degree impede navigation in the Southwest Pass, while at this day the discharge through the South Pass is but slightly greater than when the works were begun. The author, who should at least have aimed at accuracy in so important a statement, describes these mattress sills (page 317) as closing the entrances into the two larger passes, and on the last page of the work, in speaking of the relative progression of the deltas of the large and small passes, states that the advantage of this has been abandoned at the South Pass of the Mississippi, "as the other outlets have been closed in order to provide for the increased scour." We may, perhaps, imagine what would be the effect of forcing the entire discharge of the great Mississippi River through the South Pass, whose banks, barely 700 feet apart, are composed of the alluvial material of the Mississippi delta, and which form narrow barriers only a few inches high between the river and the gulf.

The book is handsomely printed at the Clarendon press, and illustrated with twenty-one plates, many of which appear to have been carefully prepared, and all of which are executed in a style worthy of a more thorough work.

Moderne Geister. Literarische Bildnisse aus dem neunzehnten Jahrhundert. Von Georg Brandes. Frankfurt-am-Main: Rütten & Loening. 1882. 436 pp.

THE four most celebrated living Scandinavian writers are unquestionably Björnson and Ibsen in Norway, Viktor Rydberg in Sweden, and Georg Brandes in Denmark. Mr. Brandes is a Danish Jew, born in Copenhagen in 1842. He entered the University with distinction in 1859, and began to study law, but soon became so deeply interested in philosophical, literary, and æsthetical subjects that since 1861 he has devoted himself exclusively to these studies, and it may be said that no other living Dane has contributed so much as he to the present physiognomy of Danish philosophy and letters; nor has any one else done so much for the development of cosmopolitan ideas in the North. In 1863 he won the gold medal of the University for a prize-essay on æsthetics, and in 1864 he took the Master's degree in æsthetics *cum laude præcipua.* His first volumes were 'Æsthetiske Studier' (Æsthetic Studies), published in 1868, and 'Kritiker og Portrætter' (Criticisms and Portraits) in 1870. They consist of a series of literary characterizations and dramatic criticisms, and give evidence of an unusually keen critical faculty. One of his earliest labors was to translate into Danish John Stuart Mill's 'The Subjection of Women,' in the preface to which he declares that "the same indignation against the crudeness of existing social conditions which induced the author to write the book, has compelled the translator to do what he can to spread the ideas contained therein." In 1870 he also published his 'Den Franske Æsthetik i vore Dage' (French Æsthetics in Our Time), and for this performance the University created him Doctor of Philosophy. This excellent work is chiefly devoted to Taine, to whom Brandes applies in a most skilful manner Taine's own methods and principles. Brandes's principal work, which has contributed most to give him an international reputation, is his 'Hovedströmninger i det 19de Aarhundredes Literatur' (Main Currents in the Literature of the Nineteenth Century), of which four magnificent volumes have appeared, and two more are in press.

Brandes's writings are thoroughly imbued with the progressive spirit of the age, and consequently he has had a great deal of opposition to contend with from the ranks of the conservatives. Indeed, in spite of his popularity among the younger generation in Denmark, life there soon became unbearable, and he removed to Berlin, where he now resides. His reputation is firmly established in Germany, and he has long been a regular contributor to the *Rundschau* and other prominent German periodicals. Among his other published works, we may mention 'Forklaring og Forsvar' (Explanation and Defense); 'Sören Kierkegaard'; 'Danske Digtere' (Danish Poets); 'Esaias Tegnér'; his translation of Mill's 'Utilitarianism,' 'Ferdinand Lassalle,' and 'Benjamin Disraeli.' The last-named has been published in a poor English translation both in England and America.

'Moderne Geister,' to come to the work before us, is a collection of eight literary sketches, devoted to Paul Heyse, Hans Christian Andersen, John Stuart Mill, Ernest Renan, Esaias Tegnér, Gustave Flaubert, Frederik Paludan-Müller, and Björnstjerne Björnson. Each sketch is a masterpiece. The fact that Mr. Brandes has enjoyed the personal acquaintance of most of the eight authors whose portraits he has drawn adds a peculiar charm to the work. Many interesting episodes are given from his intercourse with them. Thus we have a fine description of his first meeting with John Stuart Mill in Paris, and of his subsequent visit at the latter's home in England. The sketches are greatly varied in style. In one, we find the stress laid chiefly on defining the author by his works; in another, Mr. Brandes makes a special effort to present a picture of the man as he lived and moved in the world; in a third, he devotes himself mainly to a psychological analysis; while in others, biography and history are the warp and woof of the sketch. The authors described represent no less than six nationalities, but they have one thing in common which is more easily felt than described—they are "modern spirits"; and though they may not all have been consciously wedded to the spirit of the age, still the modern progressive movement, in art, science, and letters, has been greatly stimulated by them. The works of Brandes eminently deserve to be translated into English, and, when they are, we predict for them an Anglo-American popularity second only to that which they now enjoy in Germany—which is saying much.

From Kant to Hegel. With Chapters on the Philosophy of Religion. By Andrew Seth, M.A., Assistant to the Professor of Logic and Metaphysics in the University of Edinburgh. London: Williams & Norgate. 1882. Pp. 170.

THIS is an admirable little treatise, whether considered with reference to temper, style, method, or scholarship. As to the first, there is not a sneer, or a scarcasm, or an air of *hauteur* in the whole book toward any other philosopher. That a writer so prevailingly idealistic and Hegelian should not devote even an adjective to annihilating Mr. Spencer, or any other of God's humble

creatures in this wide philosophic field, marks a degree of virtue which we hope may find due recognition and imitation. Again, there is no attempt to be brilliant, witty, or poetic. Refusing to commend himself to the general reader who dabbles in philosophy, by being attractive, or even to awe him by technicalities, or over-refinement, or to fatigue him by great length, the author writes in a style which seems plain to the verge of dulness, till, after a serious attempt to grasp the condensed drift of exposition, the reader is rewarded by as much insight as perhaps can possibly be given by so brief and introductory a work. The author has taken a fresh, careful, and independent look at the leading works of the writers he discusses for himself, and has escaped the danger of blind and undiscriminating pupilage to any of them. Although agreeing with Professor Adamson in assigning a generally unacknowledged importance to Fichte and even Kant in the development which culminated in Hegel's 'Logic,' the chief importance of the thought of the latter is found in his philosophy of religion, respecting the relations of which to morality the author makes his most suggestive comments. We commend this book especially to those who may be still inclined to believe there is something in Hegel, but who quite despair of learning from Hegel himself, or from the inarticulate utterances of his thoroughbred disciples, what that something is. It would be, of course, rash to judge an author conclusively by a first work, written during the final years of apprenticeship to university teachers—especially so in this department—but we shall await with unusual interest Mr. Seth's further productions.

Lexikon der Reisen und Entdeckungen. By Dr. Friedrich Embacher. [A volume of 'Meyers Fachlexika.'] Leipzig. 1882.

THIS book consists of two parts: the first, embracing three hundred octavo pages, presents the lives of the prominent exploring travellers of all ages and countries, in alphabetic order; the second, of nearly one hundred pages, gives connected histories of geographical discovery in the various parts of the world. Particular attention is paid in both divisions to recent explorations, and the whole is marked by very commendable freshness. Fulness is also aimed at, great conciseness in style rendering it possible within so narrow a compass. The bibliography, including references to geographical periodicals as well as to special publications, is comparatively most ample. The connected sketches embrace all the periods from the voyages of Solomon's ships to Ophir to the abandonment of the *Jeannette* by De Long and his party near the mouth of the Lena. The lives include such ancients as Herodotus, Pytheas, and "Ktesias," side by side with Hesse-Wartegg (author of the 'Mississippifahrten, 1879–1881'), Purdy, and Kuropatkin. Omissions, however, occur, and among them such as even lenient criticism can hardly excuse. Thus we find no notice of Cam, D'Herbelot, La Salle, Orellana, Tristram, or Willoughby, travellers far above the average of those duly noticed. Benjamin of Tudela, the famous Jewish traveller of the twelfth century, is forgotten, while the insignificant recent peregrinations of a Moldavian Jew of the same name are recorded. To forget Reguly, and enter Xantus as "namhafter ungar. Naturforscher und Reisender," is, perhaps, not quite so bad. The *Trent* affair is forgotten under "Wilkes," and "Lynch" contains only the mention of that naval officer's navigation of the Jordan and Dead Sea, but no other particulars of his life, not even a date of birth or death. Names of places and titles of foreign books are, with rare exceptions, correctly printed. On page 289 we find "Vambéry" and "Kovest" (for Kövesd), and there also the inaccurate expressions "durch . . . Turkistan, Ferghana [which is a part of the preceding] nach Kuldscha" and "nach Bochara [the chief country on the Oxus], Samarkand und den Oxusländern," as well as the strangely exaggerated statement that Vámbéry acquired "die umfassendsten Kenntnisse in fast allen lebenden Sprachen."

The Simple Ailments of Horses: Their Nature and Treatment. By W. F. London and New York: Cassell, Petter, Galpin & Co.

THE purpose of this little book is to supply a want long felt by owners of horses, and it will be found especially valuable to those unable to obtain proper veterinary aid in time of need. The author has not only given his own experience, but has taken material from acknowledged authorities, and has compiled a brief and useful treatise which, without the use of technical terms, gives all necessary information for an amateur. Most of the ailments to which horses are liable are indicated, the symptoms are well described, and the advice for treatment is good. Probably the most valuable chapter is that on the nursing of sick horses, which contains much useful information, with a number of recipes and directions on this subject, so important and yet so generally ignored. At the end of the book is a list of prescriptions, with full directions for their use in every common disease, so that any person of ordinary intelligence can in an emergency (and with safety) be his own veterinarian. We think the volume a very instructive and desirable one for horse owners.

BOOKS OF THE WEEK.

Andrews, Fanny. Prince Hal; or, The Romance of a Rich Young Man. Philadelphia: J. B. Lippincott & Co. $1 25.
Longfellow, H. W. In the Harbor. Ultima Thule—Part 2. Boston: Houghton, Mifflin & Co. $1.
Mickiewicz, A. Konrad Wallenrod: an Historical Poem. London: Trübner & Co.
Oliphant, Mrs. Lady Jane. Harper's Franklin Square Library. 10 cents.

The Week.

ADMIRAL SEYMOUR'S long-delayed bombardment of the Alexandrian forts began on Tuesday morning, and after a feeble resistance the forts were gradually silenced and their magazines blown up, four having been destroyed up to noon, Alexandrian time, and with trifling damage to the fleet. What Arabi's object in fighting at all was does not yet appear, nor is there any sign of what he means to do next. Troops are apparently going forward both from England and India, and the Canal will be seized and guarded. The entrance of ships has been for the moment forbidden by Admiral Seymour, M. de Lesseps protesting against it as a breach of neutrality. Port Saïd is to be occupied, it is said, forthwith. The Sultan in the meantime plays his part, with that now somewhat mock dignity in which he is an adept, by sending a telegram to London, asking to have the Admiral forbidden to bombard, as a grave violation of his sovereign rights. If the Turks had any humor, one would call this grim joking; but they have not, and the capacity of the governing class for illusions seems to remain undiminished.

Of those who read the news of the bombardment of the fortifications of Alexandria by Admiral Seymour, many will be either glad or sorry. If the American public is to sympathize with either side in this quarrel, however—as it can hardly help doing in these days of telegraphs—it is desirable that its sympathies should take the right direction. An attempt is being made to persuade it that Arabi Bey and his Colonels and Notables represent the cause of Egyptian nationality against foreign meddlers, usurers, and oppressors. This attempt is based mainly on the stories of two Englishmen, Mr. Blunt and Sir William Gregory, but principally of Mr. Blunt. It is proper, however, to warn the unsuspecting against them. They belong to the class of fanatic "experts" whom it is dangerous to trust in the management of human affairs. Mr. Blunt has "Islam" on the brain. He knows a great deal about Islam, and, like the insanity "experts," he sees Islam in everything, even in Arabi Bey. He thinks this must be a revolt of the Arab believers against extortionate infidels. But facts are stronger than Mr. Blunt, and stronger even than Islam. We know what the condition of Egypt was under the late Khedive, before the foreign Control began; we know what it was before the present outbreak; and we cannot help drawing our own inferences. The late Khedive was simply the head of the gang of whom Arabi is now the head—the gang of Turkish and Arabic official scoundrels who have for centuries lived off the earnings of the peasantry. Ismaïl was the Tweed of the Ring. He borrowed enormously, taxed enormously, and enriched his creatures enormously. When his power of making "divvies" was at an end, he had to go, and then the European financiers took charge to secure the interest on their bonds. This was not the most desirable or defensible cause of interference, but the interference has done nothing but good. It has cleared the service of corruption. It has lightened the taxes, made their mode of collection humane, their amount and the time of their collection certain, given the peasants a sense of security, and the whole country such purity of administration, both financial and judicial, as it had never seen before. One single fact speaks volumes: it has abolished the extortion of taxes from the peasantry by the use of the raw cowhide on the taxpayer's naked back. These are the things which enrage Arabi and his men. They want to get at the peasantry again unchecked, as their forerunners have done for ages.

The probability which we pointed out some days ago, that France would keep out of the Egyptian scrimmage and let England do the fighting, has been almost converted into certainty by the later advices. Admiral Conrad has, it is said, been ordered to be present while Admiral Seymour is chastising Arabi, but he was not to join in the work. In fact, his orders much resemble those given to the French fleet off Dulcigno when the British were trying to force the Turks to evacuate the place last year. What is most curious about this programme is that French pride does not seem to be in the least wounded by it. Even those French journals, like the *Débats*, which mourn over it as a sign of French abasement, acknowledge that the course of the Ministry is justified by popular feeling. That Gambetta's fall was largely caused by his adventurous foreign policy, as revealed both in the Tunisian venture, which he approved, and in his negotiations with England about Egypt, is now made pretty clear. Both the Chambers and the public were afraid of a man with a foreign policy of any kind. They wanted to be sure of a quiet life. The present Ministry at first proposed to join England in intervention in Egypt, but England hung back, and suggested that the Sultan should be got to restore order, so as to avoid arousing the fanaticism of the natives. France recoiled from this because the reappearance of the head of the Mohammedan faith on the scene anywhere in North Africa would imperil French influence in Algiers and in Tunis. But the truth was that at that time neither France nor England thought the Egyptian crisis likely to prove serious. Since it has become serious the boldness of the French has disappeared, and they appear to be actually consenting to what it was supposed they never would consent to—the subjugation of Egypt by English arms alone.

It is not the dislike of war only, however, which is chilling French courage. Dread of Bismarck has much to do with it. Bismarck is now the *bête noire* of French politics, and he is more dreaded when he keeps silent than when he speaks out. It is now a settled tradition among Frenchmen that, though he may not wish to fight France at present, he is constantly trying to get her into a war with somebody, from which, whether vanquished or victorious, she will issue badly mauled, and that then, feeling assured of her harmlessness, he will go to work and reduce her in some way or other to a lower pitch of feebleness and humiliation than she has yet reached. The latest theory of his designs current in France is, that he means to solve the Turkish problem by moving the Sultan and all his belongings out of Constantinople, and establishing him at Cairo, to restore, in the midst of a Mohammedan population, the faded glories of the Khalifate. The creation of any such power in Africa would, of course, be a serious obstacle to the realization of those dreams of a New France in that region by which so many French heads are filled; and the scheme, therefore, has in French eyes a diabolical aspect not unworthy of its reputed author. Whatever be the cause, however, the world is witnessing, for the first time in a thousand years, a pacific and cautious France, which is stirred by neither fife nor drum, and is no longer drawn by the sound of the cannon. "Hang yourself, brave Crillon; we fought at Arques, and you were not there," wrote Henri Quatre to one of his friends. But the Crillons of to-day are not sorry to miss Arques or any other field.

Mr. Hubbell has written a letter to Mr. Curtis in which he emphatically declines to stop assessing Government employees, and gives a new reason for it which deserves general attention. He says that he has to assess office-holders because "the records of Congress show throughout all the Gulf States the systematic use of tissue ballots for purposes of fraud, the systematic throwing out of ballots cast, and the insertion of ballots not cast, the systematic defeat of the exercise of the right of suffrage, and every conceivable violation of law, for the purpose of thwarting the expression of the popular will." He therefore proposes to continue to collect money to "prevent these outrages" and "punish the criminals." The long and the short of the matter is that means must be provided for "smiting this crime against our common liberty," and the smiting is going to be done by the Congressional Committee; and any one who, like Mr. Curtis, attempts to cripple its operations, becomes "a most efficient ally of the Southern bulldozer"; and "there," adds Mr. Hubbell, "I leave you." A more impudent use of the "bloody shirt" was never made.

The *Herald* has rendered the community a very valuable service in bringing to light a book entitled 'The History of the Hubbells,' a genealogical work, giving an account of the family to which Mr. Jay Abel Hubbell belongs. It appears from this volume that the family is of Bedouin origin, and that Jay's ancestors, when wandering in the Valley of the Euphra-

tes, were known among the other tribes as the "Hubbas," and doubtless "assessed" a good deal, as the Bedouin custom is, over all the adjacent country. This must have been as early as the sixth century of the Christian era, for in the ninth century the Hubbas were in Denmark following the calling of pirates; and it must have taken at least three hundred years, in those days of slow locomotion and fixed habits, for a tribe of Bedouins to get so far north, and effect such a complete change in their ways as was involved in the substitution of the galley for the horse. They settled in England as freebooters, and finally changed their name to "Hubbell," and under this one of them came to America in 1647, and was the ancestor of our own Hubbell. The display in the latter of the old Bedouin and Danish passion for assessing is a very curious case of what the Darwinians sometimes call survival, and sometimes reversion.

The *Sun* has a despatch from Harrisburg containing the interesting information that Mr. Hubbell's Campaign Committee is trying to extort money by way of assessment from the managers and teachers and assistants at the Indian training-school at Carlisle, Pennsylvania. Among those assessed are one officer of the Army, one Indian, fifteen women, and half a dozen mechanics. As there is not one of the employees at the Carlisle school who owes his or her appointment to partisan influence, the application of the assessment system to them would seem to be based on the principle that everybody who draws money from the Government must be made tributary to the campaign fund of the ruling party. There is an air of thoroughness about this. It is, indeed, thorough in theory, but Mr. Hubbell will have to go a step or two further to make it so in practice. He ought to assess all the pensioners of the United States, and also all the Indians drawing annuities from the Government. If the party must have money, according to Mr. Hubbell's recent manifesto, to protect the American people against bulldozing, it ought to have a good deal of it; and nobody who gets a dollar from Uncle Sam should be spared. Mr. Hubbell has made a good beginning.

There was published last week in the *Herald* an interesting collection of evidence on the subject of "voluntary" contributions to campaign funds. It consists of the successive letters demanding money sent out during the campaign of 1880. First, in April, the poor Government clerk, with a salary, say, of $1,200, on which he has to support a wife and children, gets a letter informing him that the Congressional Committee thinks that, "under the circumstances in which the country finds itself placed," he will "esteem it both a privilege and a pleasure to make its fund a contribution, which it is hoped may not be less than $——." Having secured two per cent. of the $1,200 in this way, six months later comes a circular from Mr. Hubbell asking for "an additional one per cent." to make the "coming victory complete." Meanwhile the Republican State Committee are sending requests for "voluntary" contributions too. On August 27 they ask for "a contribution of $—— (one-half before September 3)," the amount fixed being three per cent. on the salary. September 13, the clerk receives a reminder of the previous letter. October 16, he is dunned again by a third letter, and asked to send on the money "by return mail," and finally, October 27, the Secretary of the State Committee, Mr. Glidden, throws off the mask altogether, and instead of sending a letter to the clerk himself, sends it to the head of the department in which he is employed. His letter encloses a schedule of names of employees, with the amounts "yet due" opposite each name, and winds up in the following significant terms: "The total unpaid at this date and due from the employees in your office appears to be ——. Your immediate attention to this matter is very important." In this way six per cent. is wrung out of the clerk. Six per cent. on $1,200 is $74, or very nearly an entire month's income. The beauty of it is the pretence that the whole thing is voluntary. Nobody does such a thing except under the severest pressure, and the pressure on the clerk is the severest that can be put upon any one: it is simply starvation for himself and his family, through loss of employment.

The House of Representatives in Committee of the Whole rejected an appropriation of $25,000 for a civil-service commission. The appropriation was moved as an amendment to the Sundry Civil Bill by Mr. Bayne, of Pennsylvania, a Republican. He said that he moved it because the President had asked for it, because it was to carry out an existing law, and because it would give members an opportunity to show whether the frequent and emphatic declarations of the two political parties in favor of civil-service reform had been made in good faith. Mr. Willis, of Kentucky, a Democrat, earnestly seconded Mr. Bayne. The debate was very short. Mr. Cannon, of Illinois, Republican, was opposed to all this sort of thing because, as he said, under the civil-service rules "college boys and college girls fresh from their books could stand a better examination than people who had practical experience." Mr. Neal, of Ohio, also a Republican, asked "what chance the soldiers who went into the Army and bared their breasts to the leaden storm in order to preserve their country, would have alongside of these fresh college-bred girls and boys in these examinations?" Mr. Cannon thought they would have "none at all," and thereupon both parties gave an earnest of their good faith in making repeated and emphatic declarations in favor of civil-service reform by voting against the appropriation for a civil-service commission. If the House votes as the Committee of the Whole did, President Arthur, who was scarcely less emphatic in his letter of acceptance and his message, but has since acted very much as if he had never heard of civil-service reform, may now say that he would have done something had not Congress pronounced against the whole scheme, just as General Grant said when he got tired of the reform he had commenced. It is the old farce, now repeated, however, before a more interested audience.

The Administration has been goaded by the charges made in and out of Congress that it has been trying to "stalwartize" the party by removals in the civil service, into publishing a sort of schedule of the President's doings in that field. It appears from this that out of 874 appointments made in nine months by President Arthur "only forty-nine" were owing to removals, while 428 were reappointments, and 446 were appointments to fill vacancies caused by death, disability, or the expiration of the term of office. Most of the removals too, it is maintained, were "for cause." But the return would be more satisfactory if it showed in how many cases officers whose term had expired were not reappointed. It appears clear enough from this that there is a growing fear in political circles of carrying on "rotation" by arbitrary dismissals in the old-fashioned style. More and more reliance has to be placed on the filling of places with new men on the expiration of the four years' term, and it was probably for this reason that the bill was introduced, which was defeated the other day, limiting the term of internal-revenue collectors to four years also. The dismissal of an experienced and efficient officer at the end of four years simply because his commission has expired, is, however, no more justifiable as a measure of administration than dismissal at any other time, although there is legal excuse for it.

The weather during the week was very favorable for the harvesting of winter wheat, which promises to be the largest crop ever gathered; for the growth of spring wheat, which is equally promising; and for the forcing of the corn crop, which is backward and uncertain. This news respecting the crops, the present and prospective ease of the money market (the surplus reserve of the New York banks having run up to $8,300,000), another call by the Treasury for $16,000,000 of the extended 6 per cent. bonds, and, on Tuesday, the news that the English ships had begun the bombardment of Alexandria—all these considerations contributed to help the upward speculation at the Stock Exchange. The advance in the price of stocks ranged from ½ to 9⅝ points. All classes of investments were strong, railroad bonds having advanced 1@8, and State bonds 1@6½ points, the latter the bonds of the State of Tennessee. Railroad traffic returns for the month of June and for the last two weeks were as a rule smaller than a year ago, but as the new crops begin to be moved an increase is to be looked for. The London and foreign markets were little disturbed by the opening of hostilities by England in Egypt, nor were the foreign exchanges here affected. Gold exports for this year are thought to be over, and some bankers think that within ninety days we shall again be importing gold. General trade was fairly good, and the outlook warrants the expectation of a large and satisfactory autumn trade. Anything like a general war in Europe would of course make an excellent market for everything this country has to sell.

Apropos of the circular issued by our Government, on the 31st of March last, explaining, or attempting to explain, why the International Monetary Conference was not to meet in April,

the French *Revue de la Finance*, in publishing it, remarks that "it is natural that America should seek to get European states to adopt bi-metallism, and France to resume the coinage of silver, inasmuch as she thus hopes to get rid of the large quantities of silver she is extracting from her mines, and the accumulation of which is causing depreciation; but it is impossible to understand how the French Government could allow itself to join the United States in a bi-metallist campaign. The reports of the Bank of France show that we [the French] have an abundance of gold for the needs of circulation, and that the coinage of silver would simply flood us with an inconvenient and depreciated money." In fact, there is little doubt that France may hereafter be counted out of the bi-metallic forces. In Germany, too, business men are growing impatient with the bi-metallic jeremiads, and are asking the Government to stop them and restore confidence by renewed formal adherence to its monometallic programme. The wails of the bi-metallists, however, grow louder as their cause begins to look more hopeless. The last London *Economist* reviews a pamphlet by the bi-metallic Mr. Ottomar Haupt, in which he appeals to England, in accents almost of despair, to become bi-metallic. He says the present state of things cannot last much longer; that the great countries must, if nothing is done to rehabilitate silver, "go over to the enemy—to the gold system," and "a frightful struggle for gold will then ensue," and he calls on England "to pause and take the state of things into consideration." The *Economist*, however, mocks at his calamity; points out that the Indian rupee is worth more now than it was a year ago; that silver will probably not depreciate more than it has done; that the gold countries will help to keep it up a little if need be; but that it will probably before long be only token-money throughout Europe, and that England cannot be expected to protect the silver of Mexico and Nevada at the expense of the gold of Australia, and India, and of the Gold Coast.

In his review of Mr. Blaine's diplomacy in South America, Mr. Belmont called attention on the 5th to a very singular fact in connection with the recognition of Calderon's Government. This recognition was the starting-point of Mr. Blaine's great diplomatic campaign. In a condition of general anarchy there was, of course, great difficulty in making any reasonable protest against the Chilians settling the terms of peace for themselves, and he considered it of the first importance that there should be some organized government in Peru, through which negotiations for a peace could be carried on. But the first question to be decided was, whether there was in existence any such government as Calderon's, in the possession of physical force sufficient to preserve order and give protection to life and property. Now Mr. Blaine was not without information as to this, for on May 5 of last year he received from Mr. Christiancy, who then represented the United States at Lima, a letter summing up the situation as follows: "The overwhelming majority of the people of Peru are opposed to the provisional Government (Calderon's) and still adhere to Pierola, and at present, if the Chilian Army should leave to-morrow, the only safety of the members of the provisional Government would be to leave with them." For four days Mr. Blaine meditated on this despatch, and then on May 9 he sent a despatch to Mr. Christiancy informing him that he had received Mr. Elmore as the "confidential agent" of this very "provisional Government," and telling him that if Calderon "was supported by the character and intelligence" of Peru, and was really "endeavoring to restore constitutional government," he might recognize him. This, coming in reply to his description of the Government as having no basis of any kind, Mr. Christiancy took as a hint that Mr. Blaine wanted Calderon recognized, and he obeyed orders, and in this way the State Department recognized as *de facto* a Government which it had just been informed through the regular channels had no existence in fact.

Mr. Gladstone's Ministry has received another trying blow in its defeat on an amendment mitigating the severity of the Repression Bill. As the bill stood it gave the police the right to search any house in the night or the day. In compliance with the remonstrances both of the Irish and the Radicals, he agreed to amend it by limiting this right to the daytime, except in cases in which there was reasonable ground for believing that a secret society was in session. The Tories and Whigs, however, would hear of no such concession, and they defeated the amendment, with the aid of renegade Liberals, by 207 to 194. This result was evidently due to its being unexpected. The whips did not expect the opposition, and counted on the support of the Irish who a few days previously had been suspended, and now revenged themselves by retiring to the gallery, and leaving the Premier to fight it out as best he could. The majority is small, it is true, but it is significant, because it is in part made up of Mr. Gladstone's own followers, on whom he had a right to count. It weakens him seriously, if it does not presage his resignation at no distant date. In fact, we should probably have heard of his retirement if it were not for the condition of Ireland and the crisis in Egypt, which would make either a change of Ministry or a dissolution of Parliament highly inconvenient.

The frequent interviews between the Sultan of Turkey and our Minister, General Wallace, attract great attention, and are even said to cause some excitement—at Constantinople, not here. It is a comfortable thing, after all, to have our foreign affairs in the hands of "old-fashioned statesmen," who are very certain to abstain from wild ventures. If Mr. Blaine were still Secretary of State, everybody would be apprehensive of some brilliant mischief. With Mr. Frelinghuysen in the State Department, General Wallace's mysterious conversations with the Grand Turk excite at most a little mild curiosity as to what the two gentlemen may have been talking about. There is no fear of "entangling alliances," and that sort of thing, as long as Washington's Farewell Address presides over our Foreign Office. The probability is that the Sultan wants to hear from General Wallace all he knows about torpedoes. After one of these interviews he is reported to have ordered the purchase of a lot of 200 of Mr. Berdan's manufacture. This would indicate that their talks are more likely to result in mercantile contracts than in diplomatic understandings. There will be no harm in this as long as our diplomatic representatives remain entirely disinterested parties in a pecuniary as well as international point of view.

General Skobeleff is dead, and it would be difficult to exaggerate his loss to a power like Russia, which has a very large Army and no good school of generals. The Russian Army is, as regards the high commands, very much in the condition in which the English Army was before the Crimean war, and to a less extent is still, and in which the Austrian Army was before Sadowa, and to a certain extent is still. That is to say, advancement above the brigadierships depends largely on Court favor, or family connection, or social influence of some kind, and in a very small degree on military qualities. The consequence has been in the case of all these three Powers during the whole of the present century that their campaigns have usually been disastrous or fruitless in the beginning, until, supposing the Army to have received an utterly crushing blow, as at Sadowa, the stern ordeal of war had weeded out the courtiers and brought the soldiers to the front. It was in this way that Wellington reached to the top in England, after several years of blundering, and it was somewhat in this way that Skobeleff came to be known in the late campaign on the Danube.

The value to one of the aristocratic armies of a general who has been proved, is, therefore, very great—indeed, almost inestimable. It means that as long as he is not too old, the next war will begin warily, skilfully, and without huge failures or disasters. Skobeleff was such a general to Russia. He had, too, come to the surface in the very prime of life, for he was under forty when he died, and had given probably more promise than any other young soldier of this century since Napoleon. What perhaps endeared him more than aught else to the Russian popular imagination was that he had made a display of the thing which is most dazzling in the military character, but of which Russian military annals contain but few examples—calculated audacity. The Russian Army has, ever since it made its appearance in European fields, been renowned for its steadiness, and for the tenacity with which it clings to the ground it occupies. But, except Suvoroff, it has produced none of the thunderbolts of war by which the national fancy is most impressed, and which seem to set science itself on fire with the fighting passion. Skobeleff was one of these. He was the only man in the Russian Army who seemed capable of taking it up and literally hurling it on the enemy; and probably in the next great war he will in many a trying hour be tearfully remembered.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, July 5 to TUESDAY, July 11, 1882, inclusive.]

DOMESTIC.

THE Senate, on Wednesday, voted to postpone till December next the consideration of a national bankrupt law.

The River and Harbor Bill, as it was reported by the Committee on Commerce, in the Senate, showed an increase of more than $2,000,000 in the aggregate amount appropriated by the bill as it passed the House of Representatives. The total amount recommended is more than $19,000,000. The Senate spent the week in discussing the bill. The appropriation for the Hennepin Canal caused considerable debate. It was voted on Saturday to postpone the appropriation for the canal until a definite estimate of its cost could be obtained by a careful survey. An amendment was offered on Saturday, appropriating $500,000 for the improvement of the Potomac River flats at Washington and Georgetown. It was adopted on Monday.

At a caucus of Republican Senators on Friday it was agreed to consider speedily the House bill for the reduction of internal-revenue taxation, and to prepare amendments to it, providing for a restoration of the tariff duties on sugar which were in force before the last change—the effect being to reduce the duty about twenty-five per cent.; also amendments for the reduction of duties $8 per ton on Bessemer steel, and for a reduction on hoop-iron. The effect of this action by the caucus will be a prolongation of the session, as a long tariff debate is inevitable. Amendments in accordance with the resolution have been introduced in the Senate.

The bill for the expenses growing out of the illness and burial of the late President Garfield, as it finally passed the Senate, reduces the appropriation from $75,000 to $57,500, and the amount for medical services from $52,500 to 35,000. The President's physicians were severely criticised by Senator Vest, of Missouri, during the debate on the bill.

On Monday the Senate passed the House bill providing for a building in Brooklyn for the accommodation of the Post-office, Internal Revenue, and other Government offices, at a cost for site and buildings of $800,000.

Senator Frye, of Maine, has presented in the Senate a petition from the Board of Trade of that State, urging Congress to provide a Commission to inquire into the wants of the national mercantile marine, and to report such measures as would tend to the relief of this industry.

The debate on the Naval Appropriation Bill, which was continued last week, led to several warm passages-at-arms between members of the House of Representatives. On Wednesday an amendment was adopted which strikes out of the original bill the proviso limiting to $400,000 the amount to be applied to the repair of wooden ships, and provides that such repairs shall not exceed thirty per cent. of the estimated cost of a new vessel of the same size and like material. During the debate on an amendment to reduce the amount for the Bureau of Construction and Repair, Mr. Belmont, of this city, took occasion to review the South American policy of our Government. In his speech, severely criticising Mr. Blaine's "spirited" foreign policy, he said: "The diplomacy of this country from March to December, 1881, went far enough in the interest of the claimants and speculators upon Peruvian territory. . . . A hundred iron-clads in the harbor of Callao could not retrieve the unfortunate position in which this Government was placed by its State Department." $1,750,000 was finally appropriated to the Bureau of Construction and Repair, and any part of this sum not required for the specified purposes shall be devoted to the construction of two new cruising vessels of war. On Thursday afternoon, Mr. Robeson, of New Jersey, took the floor to close the debate, and devoted an hour to the vindication of his administration as Secretary of the Navy. He denounced in the bitterest language those who had criticised him, especially alluding in terms of personal abuse to Mr. Whitthorne, of Tennessee, who, as Chairman of Naval Committees in former Congresses, had been a persistent critic. Mr. Whitthorne made an angry reply. The bill finally passed the House, by a vote of 119 to 75.

After the passage of the Naval Bill, the Sundry Civil Appropriation Bill was taken up in the House of Representatives. The bill appropriates about $23,500,000. During the debate on Thursday afternoon, Mr. Bayne, a Pennsylvania Republican, made a telling attack upon President Arthur's use of the patronage, and coupled it with a plea for civil-service reform. In the course of the debate on Friday, Mr. Butterworth, an Ohio Stalwart, defended the Administration against Mr. Bayne's charges. He averred that never since the days of Washington had appointments been more carefully and judiciously made than by President Arthur. The speech led to an angry colloquy with Mr. Cox, of New York. The appropriation for the Board of Health, included in the bill, is very small, but an amendment was adopted on Saturday including small-pox among the diseases to be investigated by the Board. An amendment, by Mr. Bayne, of Pennsylvania, appropriating $25,000 to enable the President to carry out the provision of the Revised Statutes which authorizes a Civil-Service Commission, was lost, by a vote of 40 to 54.

The conference report on the bill to enable national banking associations to extend their corporate existence was presented in the House on Monday, and adopted, by a vote of 108 to 78.

The joint resolution, authorizing the President to call an International Conference, to fix on, and recommend for universal adoption, a common prime meridian, to be used in reckoning longitude and time throughout the world, passed a third reading in the House of Representatives on Thursday.

Mr. Deuster, of Wisconsin, has introduced in the House of Representatives a bill to regulate the carriage of passengers by sea, drawn up in accordance with the recommendations of President Arthur, in his recent message vetoing a similar bill.

At the first meeting of the Tariff Commission in Washington on Thursday, Mr. John L. Hayes, President, delivered the opening address. Commenting on the duties of the Commission, as set forth in the law establishing it, he said: "A radical or subversive change in the present general economic policy of the Government is virtually interdicted, and a judicious, not a revolutionary tariff, a revision, not a destruction of existing tariff laws, is declared to be the object to which our labors should conduce." The President was instructed to consult with the Secretary of the Treasury as to what expenses might be legitimately incurred. The Commission, in a body, called on President Arthur.

Secretary Folger has published a report in regard to the Doyle counterfeit bond plate, founded on an examination by experts. The report shows that the plate is counterfeit in every part, and that there could not have been any assistance rendered by employees of the Government, or any use made of the genuine plate.

Commodore Shufeldt, of the United States Navy, has been recalled from the command of the Asiatic Squadron. It is said that the recall was made at the request of the Chinese Government, which was offended at a critical letter written by the Commodore some months ago.

A statement having been made that Minister Lowell had tendered his resignation of the English Mission, an official denial was made at the White House and State Department on Thursday.

There is a dispute among the physicians who made the Guiteau autopsy. Dr. Lamb has made and published a report without submitting it to Drs. Sowers and Hartigan, who assisted in the work, and they accuse him of going beyond his authority. The published report is technical in its terms and in detail. It reveals nothing new as to the sanity or insanity of the assassin.

It is asserted in Washington that the body of Guiteau has been disinterred from its grave in the jail, and secretly conveyed to the Army Medical Museum, in that city.

Chairman Hubbell, of the Republican Congressional Campaign Committee, has written another letter to Mr. George William Curtis, President of the Civil-Service Reform Association, in which he denies that any office-holder is coerced into the payment of political assessments, and asserts that as long as election frauds continue in the South, he will continue to ask for these contributions from office-holders to maintain a Republican organization strong enough to prevent or diminish these outrages.

Notwithstanding the correspondence between Mr. Curtis and Mr. Hubbell, it is said that Government employees are sending in their assessments as freely as on previous occasions. The Navy-yards have responded with especial promptness. Southern postmasters have occasionally declined to contribute.

The Grand Jury convened at Washington on Monday to consider new evidence in the Star-route cases, which it is rumored will implicate a present United States Senator.

North Carolina Democrats, in their Convention on Wednesday, nominated R. T. Bennett for Congressman-at-large, and in their platform made the color-line the keynote of the campaign.

The Arkansas Republicans have nominated W. D. Slack for Governor. The platform opposes repudiation.

It is believed that the Stalwart Republican candidates in Pennsylvania will present their resignations at the next meeting of the State Central Committee, and leave it to the discretion of the Committee to take whatever action they think best for the good of the party.

A duel between two Georgia editors, Col. Lamar, of the Macon *Telegraph*, and Col. Howell, of the Atlanta *Constitution*, was averted last week by the arrest of the latter, with his second.

Michael Davitt, the Irish agitator, was given a reception by the Central Labor League of New York, Brooklyn, and Jersey City, in Union Square on Wednesday evening. About 10,000 persons were present.

The strike of the freight-handlers in the yards of the great railways leading to this city still continues, but the new hands employed have acquired more skill in their work, and there is less freight than usual to handle, so that the business of this city is not much impeded at present.

Crop reports from the West still continue favorable, though there are some discouraging accounts of the prospects in the "corn belt." The wheat harvest is in progress in many of the States, and an extraordinary yield seems to be assured.

The peach crop for that part of the State of Delaware traversed by the Delaware Railroad is estimated at 5,000,000 baskets.

By the collision of the tug-boat *John Lomas* with the excursion steamer *Scioto* on the Ohio River, near Mingo Junction, on July 4, more than seventy-five lives were lost. 700 passengers were on board the *Scioto*, which sank in three minutes. Intoxication of the boat's officers is said to have been the prime cause of the disaster.

The thirty-seventh annual session of the New York State Teachers' Association was held last week in Yonkers. About 200 delegates were present.

Mr. R. C. Watson, the referee, has adjudged the Columbia College crew entitled to the flags for which Columbia and Harvard were to have contested on July 3, at New London, Conn. He holds that Columbia kept the original agreement.

John Gilbert, the veteran actor of Wallack's company, was taken suddenly and seriously ill at his summer home in Manchester, N. H., on Wednesday night. He is very weak, but it is believed that he will recover. On Saturday his physician pronounced him out of danger.

FOREIGN.

The Egyptian crisis rapidly approached its climax during the past week. On Thursday afternoon, Admiral Seymour, of the British fleet, sent an ultimatum to the authorities of Alexandria, demanding the instant stoppage of the construction of the earth-works, under threat of opening fire from the fleet. The Sultan telegraphed the same day, holding the Khedive and Ministry responsible for the consequences of not yielding to the English Admiral's demand. The work was, however, continued, notwithstanding a denial on the part of Ragheb Pasha, until Friday morning, when it was stopped. On Saturday the Conference agreed on a formal invitation to the Porte to intervene in Egypt, and urged a reply before Wednesday. If the Porte refuses, or seems afraid to accept, 25,000 men will be concentrated by the intervening Powers, with a reserve of 75,000. The army will land at Aboukir, and will be divided into two parts. One will march on Alexandria. The other part will seize the railway at Damanhour, Arabi Pasha's only means of retreat, and will thus force him to fight or yield.

After apparently ceasing work on the fortifications of Alexandria for a number of hours, it was defiantly resumed, and Admiral Seymour was forced to extreme measures. Early on Monday morning he addressed a note to the Egyptian Government, demanding the temporary surrender of the forts at Alexandria for the purpose of allowing of their disarmament. He added that if the demand was not complied with within twenty-four hours, he would open fire on the city from the fleet. All vessels of neutral fleets were warned to leave the harbor; the captains of the British vessels were given their final instructions as to the details of the bombardment; the Eastern Telegraph Company transferred its office on board a ship; and every preparation was made for the first act of war. Throughout the day the Egyptians kept busily at work on their fortifications, and the military expressed their determination of fighting to defend the forts to the last, and then retiring to the interior of Egypt, where the preparations for resistance are complete.

When Tuesday morning came, no reply had been received to Admiral Seymour's demand. The penalty was then executed. At seven o'clock the bombardment was begun by the *Alexandra*, *Sultan*, and *Superb*. The batteries from the forts at once replied, but their shot fell short. These three vessels were soon joined in the cannonade by the *Inflexible*, *Téméraire*, *Penelope*, *Invincible*, and *Monarch*. Twenty minutes of such work sufficed to silence two of the forts. Great excitement prevailed among the inhabitants of Alexandria, and crowds hastened to seek refuge in the Palace. Soon the streets became deserted. The military, however, remained firm, though the forts slackened fire. About nine o'clock Fort Marsa el Kanat was blown up; the top of a tower at Fort Pharos was carried away, and many guns in that and other forts were dismounted. As the day progressed the fire from the Egyptians was less frequent. At noon the magazine of Fort Ada was blown up, and four forts in all had been destroyed. An hour later and not an exposed gun on any fort could return the fire of the fleet. The Moncrieffe Battery and Pharos Fort were completely silenced, and by 6 o'clock all the forts, except one or two inside the harbor, were equally powerless. At 6:50 o'clock Admiral Seymour suspended the bombardment for the day.

At the end of the first day's bombardment the casualties on the British fleet were five killed and twenty-seven wounded. The effect of the Egyptian shot upon the vessels of the fleet was almost inappreciable, except in one instance, where the *Inflexible* was penetrated. The men were mostly wounded by splinters. One of the events of the attack was the landing of twelve officers and men from the *Invincible*, under cover of the fire of the *Condor* and *Bittern*. They succeeded in destroying with dynamite the heavy guns of Fort Mex.

The Sultan has rejected the proposal of the Council of Ministers to appoint a delegate to the Conference. He complains of the lack of friendship shown him by England.

The cost to England of armed intervention in Egypt is estimated at more than $20,000,000. Orders have been given in India to prepare a force of 1,800 English and 5,000 native troops, including three batteries of artillery, for Egypt. Large siege-trains have been organized at Agra and Bombay.

Admiral Conrad, of the French fleet at Alexandria, has been instructed to remain passive, and only participate if provoked by some act or incident. M. de Freycinet, the French Premier, stated in the Chamber of Deputies, on Thursday, that France's preparations do not exceed the limit of necessary precautions, and that the consent of the Legislature would be asked before intervention should ensue. The French Agent at Alexandria has been instructed to do his utmost to prevent hostilities.

On Saturday the Government submitted a request to the Chamber of Deputies for a credit of 7,800,000 francs, for precautionary naval preparations.

A Montenegrin aimed a pistol at the Khedive on Thursday, but he was seized before he could discharge the weapon. He said that he mistook the Khedive for Arabi Pasha.

Five thousand Egyptians, under General Yusuf, have attacked the False Prophet and been defeated, losing 2,000 men. The False Prophet, with 7,000 men, is marching on Sennaar.

Mr. Gladstone met with an unexpected rebuff in the House of Commons on Friday afternoon. During the general debate on the Repression Bill, Mr. Trevelyan, Chief Secretary for Ireland, offered an amendment to limit the right of search to the day-time, except in the case of secret societies. The Conservatives strongly opposed it. Mr. Gladstone declared that if the amendment was rejected he would have to consider his personal position. The Parnellites were not on the floor, but eight of them viewed the contest from the gallery, and refused to descend and vote. A number of Liberals were absent, not expecting any controversy over the bill. The ballot was taken and the amendment lost, by a vote of 194 to 207. Mr. Gladstone said that under ordinary circumstances he would have asked the House to postpone further proceedings, but in the remarkable state of Ireland he did not think it was right to take that course. Report on the bill was, therefore, finished at 11 P. M., and it then passed the third reading. On the same evening it passed its first reading in the House of Lords. The defeat of Mr. Gladstone caused considerable excitement in political circles, but even Conservative organs did not consider it a sufficient cause for a resignation of the Ministry, or dissolution of Parliament. Mr. Gladstone has decided to accept the decision of the House of Commons.

The Repression Bill passed its second reading in the House of Lords on Monday afternoon. In the House of Commons, Mr. Gladstone, commenting on his rebuff, said that the defeat of the Government was unprecedented. The Government would use discretion in employing the powers given them by the Repression Bill, and he hoped it would not be necessary to employ all of them. Outlining his programme, he said that he had abandoned the hope of passing any of the bills mentioned in the Queen's speech, on the opening of Parliament, except the Corrupt Practices Bill. He said that it would be impossible to amend the Land Bill now, and, consequently, after the passage of the Repression and Arrears Bills, he should ask for an adjournment, probably until the latter part of October, Parliament then to meet for the purpose of discussing procedure only. He declined to answer any questions as to the Government's intentions in the question of procedure.

In the House of Lords on Tuesday the Repression Bill passed through Committee and its third reading without a division.

On Thursday night the House of Commons went into Committee on the Arrears of Rent Bill for Ireland, after a strong speech in its favor by Mr. John Bright. He expressed confidence in Mr. Gladstone's estimate of the cost and the means of defraying it from the Church surplus. He deprecated the manner in which the opponents of the bill had referred to the Land Act of 1881; expressed astonishment at the opposition of the Irish members to the emigration clause; believed that if the country became more tranquil the purchase clauses would go into extensive operation; approved the method of making advances, and declared he did not believe that the Land Act was a failure.

The Archbishops and Bishops of Ireland have issued a circular to the priests, directing them to discountenance the Ladies' Land League.

The famous Russian General Skobeleff died suddenly at Moscow of heart disease on Friday morning. He was only thirty-nine years of age. He was noted for his bravery and for the originality and daring of his campaigns. His career in Bulgaria was especially successful and romantic. Last winter he came into unenviable prominence through an indiscreet speech made in Paris, in which he avowed Panslavist sentiments and hatred to the Germans. The speech led to strained relations between Russia and Germany. Skobeleff was publicly rebuked by the Czar. He was buried on Monday.

Count Tolstoi, Russian Minister of the Interior, has instructed the frontier authorities to do all that is possible to facilitate the return of the Jews.

Nine thousand copies of a revolutionary proclamation, signed by a cousin of the Czar, were discovered on Thursday at the Ministry of Marine in St. Petersburg. Immediately after the discovery, the Director of the Department committed suicide.

A new Bulgarian Ministry has been constituted, with General Soboleff as President.

The Sultan of Turkey has presented General Lew Wallace, the United States Minister at Constantinople, with a handsome painting.

The Pope, in an allocution at the Consistory last week, said that the position of the Church in Italy was becoming worse than ever. He declared that the Italian Government was guilty of bad faith in refusing exequaturs to twenty Bishops whom he had nominated.

Two-thirds of the French Senate Committee on the Divorce Bill are opposed to the measure.

The principal leaders of the insurrection in Uruguay have been killed.

The total receipts of the Custom-houses of the island of Havana during the past fiscal year were $10,445,656, being a decrease of $1,460,284 as compared with the receipts during the preceding fiscal year.

The Amateur Rowing Association of Henley, England, decided on Wednesday not to admit the Hillsdale, Michigan, crew to races at the annual regatta as amateurs, in accordance with the English definition of that term. At the Marlow regatta, on Saturday, the Hillsdales beat the Marlow crew by a clear length. The Metropolitan and Mousley Committees have also decided against admitting them.

THE GLADSTONE MINISTRY.

THE Gladstone Ministry has reached its meridian in two years, which is sooner than was expected, considering the size of the majority on which it came into power and the enthusiasm with which its advent was hailed. The beginning of the descent to which all ministries come sooner or later, was marked on Saturday unmistakably by Mr. Gladstone's formal submission to the adverse vote on the search amendment in the Irish Repression Bill. The first acceptance of defeat is a confession that the period of vigorous aggressiveness is past, and that the Ministry has begun to stay in power, not so much because it has work to do as because nobody else is ready to take its place, or because the majority dread a general election. In the present House of Commons no Ministry but the Gladstone Ministry is possible. The Tories cannot count either on the recalcitrant Whigs or on the Irish any more than Mr. Gladstone can, although they get occasional help from them in harassing him. Every one knows there can be no new combination without an appeal to the country by a dissolution, and it does not appear that anybody is ready for this. It would mean a period of confusion and uncertainty, amounting to a real interregnum, at a moment of great national difficulty. The Irish question is far from settled, because it has to be settled in Ireland, and not in London, and the Egyptian question, which is but a small one when one considers only the suppression of Arabi Bey and his army, is an enormous and far-reaching one when one asks what is to succeed Arabi Bey and his army, and who is to settle what it is to be. In fact, the crisis is one in which a change of Ministry would be a veritable "swapping of horses when crossing the stream," to use that phrase of Lincoln's which has had more success than any other of his *mots*, and has now become a stock political illustration in every constitutional country.

The Ministry will, therefore, in the absence of any great catastrophe, such as the breakdown of Mr. Gladstone's health, run on probably two or three years longer, somewhat in the condition of what the French call a business Ministry, without force enough or unity enough to face any of the great measures of reform, such as the assimilation of the county franchise, or the reorganization of county government, or the creation of the new municipality of the city of London, which occupied prominent places in their programme when they took office. In fact, while we are writing there comes the rumor that Mr. Gladstone already contemplates resigning the leadership of the House of Commons, which would of course devolve on the Marquis of Hartington—a change which would certainly bring the Ministry no access of strength, though it might conciliate some of the more mutinous Whigs. It would indeed give the Cabinet still more plainly the character of a stop-gap.

This step of Mr. Gladstone's, if taken, will probably be due to his own recognition, which he half expressed the other night after his defeat, that a good deal of the hostility to his Ministry is in reality hostility to him personally. This has now really become a prominent factor in British politics, and yet any one who undertook to write the history of his administration, and had no materials but the newspapers of the period, would find it impossible to give any adequate explanation of it. The London Tory press exhibits it in a most rabid form, but it never furnishes what will appear to an outsider sufficient excuse for it. In fact, considering the hold that Gladstone has on the masses and on the religious middle class, the descriptions given of him in such papers as the *Saturday Review* and the *St. James's Gazette* appear to a foreign reader like humorous caricatures. But that these papers fairly express the feeling toward him of the bulk of the Tory members of the House, and that their language is but a very mild reproduction of that used about him in the Conservative sporting and military clubs, and in Conservative drawing-rooms, there is no doubt. Lord Salisbury's savage vituperation of him, which is unprecedented as directed by the leader of one English party against the leader of another, is but the terse editorial expression of the view of Lord Salisbury's social set.

This personal hatred of Gladstone, which in the Tory mind now almost takes the place of a political programme, is one of the most striking signs of the great change which is unquestionably impending in British politics. It does not resemble any other force which has hitherto influenced British affairs, and it does strikingly resemble the feelings which French Legitimists have ever since 1793 entertained toward Liberal and Republican leaders. Gladstone is detestable and detested because he represents that great flow of sentiment into politics which always follows democratization. He has never got over the loathing caused among the Whigs and Tories ten years ago by the phrase used in advocating the claims of the workingmen to the franchise—that they are "your own flesh and blood." Worse than this, he has recognized the fact, which the English gentry find it still difficult to believe or grasp, that the power in England has passed to the borough voters. His speeches are addressed to this class. It is to its religion and morality and to its social and political ideals that he appeals on the stump and in Parliament, and it recognizes him as its leader, and indeed one may say its apostle.

To understand how exasperating this is in Tory circles, it must be remembered that the theory on which Disraeli educated his followers into passing the Reform Bill of 1867 was that the newly-enfranchised voters would support the party to which they owed their enfranchisement, in obedience to a familiar political tradition, and that by making this "great leap in the dark" a Conservative measure it would cause no change beyond giving Tory chiefs larger popular support. It has made a prodigious change, however. It has brought a new power into politics, which is as yet only half felt, but of which only the Liberals get the benefit, and of which Gladstone, in the last stage of his career, is the chief representative. He represents, too, one other change which is well calculated to make a man obnoxious—and that is earnestness in politics. He has succeeded Palmerston, who had set in the Liberal party the *insouciant*, jocose tone about public affairs, and was in this ably seconded by Disraeli in the Tory party. Between the two, they had made the generation of English politicians which is now growing old, decidedly the most nonchalant since the Reform Bill. To this generation the appearance of Gladstone as a sort of John the Baptist—wearing camel's hair, living on locusts and wild honey, and giving notice of the coming of a new ruler—is disgusting in the extreme, and their anger is the bitter, grotesque, and noisy anger of the powerless and helpless.

The last though not the least of his offences is that he has, though perhaps unwittingly, laid open the Irish ulcer to the very bone, and demonstrated its incurability by any of the processes hitherto employed. It is owing to his feverish activity that the English public has been got to face the Irish problem as it has never faced it before, and ask itself for the first time since the Union whether it is possible for it to govern Ireland as it has been governed. The orthodox English view of the question for the past eighty years has been that expressed by Canning, when he cried, "Repeal the Union—restore the Heptarchy!" That view has clearly passed away, and its passing away is largely due to Gladstone's restless experimentation. He does not leave behind a contented or peaceful Ireland, but he leaves an Ireland which no English statesman of either party can hereafter dispose of by an Arms Bill or Repression Bill.

BOOKS ABOUT HEALTH.

THERE is no branch of literature in our day in which the activity is more constant than that devoted to popular instruction in the art of keeping healthy. There are periodicals devoted to it exclusively. Every year half a dozen books make their appearance, mainly at this season, telling us what to eat, drink, and avoid, how to live long, how to escape sickness, with sub-directions telling us how to chew, what time to go to bed, how many blankets we should sleep under, what sized pillow we should use, what time to rise, the proper temperature of our bath, how to rub ourselves on getting out of it, how often we should wash our feet, how much exercise we should take, and at what hour we should take it, what we should wear next our skin, and what kind of hat we should wear in summer. In fact, most of the books on health now closely resemble in minuteness of information the useful little manuals for mothers, regarding the care and treatment of children in the nursery, with which the world has so long been familiar. The adult who chooses to avail himself of them, consequently, need never take the smallest step in the care of his person without the best medical advice. There is nothing, from the brushing of his teeth in the morning to the blowing out of his candle at night, which he may not perform under professional judgment, without looking into the strictly technical books at all.

From one point of view the abundance of this hygienic literature is an excellent sign, because it shows the rapidly-increasing attention of the medical profession to the art of prevention,

which will probably before many years greatly overshadow, if it does not supersede, the art of cure, and which there is no doubt has of late outstripped the art of cure in efficacy, and stands higher in the estimation of all the older doctors. Telling people what to eat, drink, and wear, and how to work and play in any particular climate, is simply advising them, in Darwinian phrase, to adapt themselves to their environment so as to escape the remorseless law of natural selection, which makes such short work of those lower animals which pay no attention to hygiene, or are born with feeble constitutions or the wrong color. But then there is the danger of giving people more advice about their bodies than their minds can bear, and to this the literary doctors are undoubtedly exposing us. They have done much good, especially among the women, who fifty years ago lived in violation of even the elementary rules of a healthy existence. They have improved people's food and clothing a good deal, and have almost effected a revolution in popular habits in the matter of ventilation, for instance. But in the minuteness of the directions they are now giving about exercise, digestion, bathing, and the like, they are either deepening the morbid streak in the human mind, or leading people into mistaken and often injurious experimentation. Nothing, for instance, is more prejudicial to health than too much thought about health, and this the health literature of the day undoubtedly tends to foster. In fact, that it does not do more mischief among the men is probably due to the fact that most of them are so busy that they have no time to study their own sensations. An idle man who tried to regulate his life by the rules of any popular health manual, and watched the effect of his regulated food and his regulated exercise, would almost certainly become a hypochondriac; and that many who start with some trifling constitutional weakness do become hypochondriacs in this way, there is little doubt. In fact, with regard to the body, as with regard to the soul, there is much danger in casuistry, and rules of health are very apt to be the casuistry of the body. A man who ran to a spiritual director every day to find out the exact moral quality of each of his acts, and its bearing on his spiritual health, would soon find that there was but little spiritual health left in him, and the man who is constantly asking himself whether this or that is good for his body, and getting his answer out of a guide-book, is very likely to have an analogous experience. In fact, so true is this, that one of the conditions of health may be said to be the diversion of the mind from all thoughts about disease.

Another defect in the kind of literature of which we are speaking is the too great absoluteness of its teachings. There are but few health books, if any, read by the young. The young are generally well, and generally indisposed to introspection, either mental or physical. They find they can eat anything at any hour, and they find that the proper amount of exercise for them is the amount they like to take. They are not interested in indigestion, or sleeplessness, or any of the other ills for which the books seek to provide. If one happens to be with a party of young men in which the subject of food, or drink, or clothing comes up, one finds that it is discussed wholly from the standpoint of taste. They exchange views about what they like and dislike, and are immensely bored by observations on the hygienic quality of their tastes. Rules of health, in fact, are seldom perused or called for by anybody below the age of forty—at which, as the proverb says, "every man is a fool or a physician"—that is, he is either a person on whom health preaching would be wasted, as it would be on a cow or a horse, or a person who has through experience accumulated a body of hygienic doctrine of his own which no doctor can shake. Go into any company of middle-aged men, and listen to a discussion of meat or clothing, and you find that the question of healthfulness dominates the discussion. Each man's contribution to it is apt to be in the main an account of his own experience of what "agrees" with him; that is, he passes judgment on food, on dress, on exercise, on bathing, on hours of sleep, according to his experience of his subsequent physical sensations. It is this class, in fact, which buys and reads most of the health books, because it is most interested in morbid conditions of the body. But it makes the health books, with their *ex-cathedrâ* tone, very strange guides, when we discover that in such a company as we have mentioned probably no two men's experience is the same about anything. One finds unlimited cucumbers most refreshing, another the smallest piece of cucumber deadly poison. One finds tea late in the evening necessary to a good night's rest; another finds tea later than five o'clock in the afternoon fatal to sleep on the following night. One finds a light breakfast the best preparation for a good day's work and a sure cure for rheumatism; another finds a hearty breakfast indispensable to any activity, either mental or bodily, and the only safeguard against dyspepsia. One cannot dine later than two P. M.; another is miserable if he dines before seven. One cannot drink coffee; another finds coffee essential. Early rising clears one man's brain; it makes another stupid and incapable all day. One finds a daily cold bath the making of him; another tried it once and nearly died of it. One needs two hours' daily exercise for any effective brainwork; another finds the less he takes the better he thinks. So it is about tobacco and about alcohol, and about bed blankets and about woollen undershirts, and about almost every habit, article of diet, or of clothing. Not only are there, in the matter of physical health, as many tastes as there are men, but apparently nearly as many requirements. In fact, if we go behind the health books to the sources from which the authors extract their conclusions, we shall find that almost the only certain and unassailable rule of hygiene, which will bear universal application, is that pure air is good for the human animal, and that the more of it he has the better. All else is doubtful and disputed, or weakened by inscrutable peculiarities of individual constitution.

BUDDHIST ARCHÆOLOGY.

THE study of the sculptures and inscriptions found upon Buddhist rails and stûpas, or topes, recently discovered in India, has brought to light many curious circumstances relating to the early history of the Buddhist religion. There are three ruins which have been especially examined, and their history is now pretty well known to us. Taking them in order, we have the tope at Sanchi, near Bhilsa; the tope of Amarávati on the River Kistna, and the tope of Bharahut 120 miles southwest of Allahabad. It is needless to refer to the way in which these ruins were first discovered. We are indebted for our immediate knowledge of them to Mr. James Fergusson ('Tree and Serpent Worship'), and to General Alexander Cunningham ('The Tope of Bharhut').

When the account of the Sanchi tope was first published, so little was known of the meaning of the sculptured scenes on the pillars and rails that Mr. Fergusson wrote his book with a view to illustrate the old superstition of 'Tree and Serpent Worship.' Buddhism, in fact, was not understood, and consequently no explanation could be given of the scenes wrought with so much care and such surprising skill on the stone pillars and gateways of the topes. But now we understand that the worship is not paid to the tree or to the serpent, but that the tree is symbolical of the presence of Buddha, and that the vâgas, or serpents, are not being worshipped, but themselves engaged in adoring the presence of the Great Teacher. It is an important fact to have established, that, at this remote period and among these people, such worship was supposed possible—viz., the veneration of a presence not visible, but yet real.

Mr. Fergusson, in the first edition of his great work, supposed that many of the scenes depicted represented interviews or relations between Aryans and Dasyus—*i. e.*, between the newcomers into India and the old native races. This was the only explanation he could give of the differences in dress and appearance of the persons drawn in the scenes. It was a discovery of some importance, therefore, when Mr. Beal explained the scenes to be descriptive of events that had occurred in the history of Buddha himself. These stone-cut pictures are, in fact, records of various episodes that make up the life of Buddha, or else of events in his previous history. Among other notable instances of his self-denial is one given in many Buddhist books of an occasion when he sacrificed his possessions, his wife and children, for the sake of perfecting himself in the virtue of charity. This scene we find sculptured at Sanchi on the Northern Gateway, and the explanation of this became the key to much that followed. Gradually, it was found that the groups on the pillars, etc., were throughout descriptive of different scenes more or less familiar to the student of Buddhism, and that there was scarcely one of them that could not be thus explained.

This once admitted, we are able to refer these events, and the history in which they occur, to a period some time previous to the date of the tope. This is a satisfactory standpoint. As long as the records of Buddhism were fixed, as to date, only by literary evidence, there was always doubt and uncertainty. But now we rest on evidence of another kind: the style of architecture and the form of the very letters engraved on the stone afford a test which, in the hand of experts, cannot mislead us. We have, then, at Sanchi evidence that the birth and career of Buddha, as now related to us in books, were accepted and believed at the beginning of our era throughout central India, at

least. If we consider the meaning of this, we shall understand its importance. For instance, on plate xxxiii. of 'Tree and Serpent Worship' (second edition) there is a scene representing the miraculous incarnation of the Buddha by the descent of an elephant upon his mother. This is a cardinal point in the history of Buddhism. If, then, we are sure that this sculpture is as old as the first century of our era (Fergusson, *in loco*), we need not doubt that the dogma of Buddha's miraculous incarnation dates from a pre-Christian period. The same result follows with respect to the entire legend or legendary history, and so we may dismiss the argument of Dr. Eitel (in his 'Three Lectures on Buddhism') and Dr. Flanders (in his 'Christ and Buddha'), with respect to the late origin of these quasi-Christian particulars, as insufficient.

Were there any need to confirm the date given for the Sanchi sculptures, we need only refer to the lately published account of the Bharahut tope by General Alexander Cunningham. This tope is assigned without any hesitation by the author to the third century B. C., and among the sculptures we have the incarnation scene (pl. xxviii.) as plainly described as at Sanchi. The impression left on the mind by a review of the evidence afforded us by the Sanchi and Bharahut topes is, that the legend of Buddha, including his incarnation, renunciation of the world, temptation, and enlightenment, is of an independent origin, and of greater age than the Christian Gospel history.

It may be asked, therefore, whence arose the striking parallel which this Eastern legend does certainly present when compared with the history of Christ. To this it appears there is a reasonable answer. It has just been discovered that at the time of Buddha's preaching there was a republic of Northern invaders (or immigrants) settled in the valley of the Ganges, and that these were during Buddha's lifetime converted to his doctrine. In plate xxviii., fig. 1 ('Tree and Serpent Worship') we have a scene in which these Northern people act the principal part. They are the same as the Yue-chi, or the "White Huns," of the Chinese accounts. They are a curly-haired, gaitered race, corresponding with the Scyths of history. Now, these Scyths were at first a small and obscure people, settled on the River Araxes (Diod. Sic., ii., 375), and, afterward increasing in numbers, were divided into various tribes, and advanced west and south to the River Tanais (Don) on the one hand, and through Arabia and Palestine on the other, into Egypt. They were the same as the Cuthæans who settled in the neighborhood of Samaria. The name Scythæ is probably identical with the word Cuthæ, the sibilant *s* being prefixed as in numerous cases (stûpa for tope, Scoti for Cotti, σμικρος for μικρος, spike for pike, etc., etc.; the Sanscrit *var* and *svar* are identical). A portion of these Cuthæans migrated into India, where they were known as Sacæ, and from these probably sprang the race of the Sâkyas to whom Buddha belonged. These Scyths having their origin near the cradle of the human race, it is probable that they had preserved among them portions of the earliest traditions in the world's history, and among the rest fragments of a primitive belief in the birth of a Saviour or Deliverer, and his triumph over evil. There can be no doubt, or reasonable doubt, that such a primitive belief existed; and there is no reason why the knowledge of it should be confined to one family of the human race—*i. e.*, the Semites. The Cushites (sons of Cush) also inherited the belief—perverted it may have become, but never eradicated; and so we are prepared to find it in a mutilated form, but yet strong even in its obscurity, springing up among and shaping the religious belief of the descendants of the people among whom it was originally preserved. Hence we find it among the Sâkyas of India, the Cushites of Samaria, and the Northern tribes who were scattered throughout the valley of the Ganges at the time of Buddha's advent. This explanation of the difficulty of the parallel features in the history of Buddhism and the Gospel narrative appears to be sufficient for all purposes. The existence of such traditional knowledge of the birth and triumph of a Saviour cannot by any argument be disproved, and the phenomena which present themselves in the existence of Buddhism at the present time exhibit the vitality of such a belief even in its imperfect form.

There is one curious point in the history of these Scyths, or Northerners, in the valley of the Ganges, which we cannot pass by without notice. They were republicans, occupying various important towns, of which the city of Vaisâlî was chief. They were called the Samvajjis, or "United Vajjis." We are told, in an interesting episode that occurs in Buddhist literature, what their character and mode of government were. It is worth transcribing. So long, said Buddha, as the Vajjians hold full and frequent public assemblies, they will prosper. So long as the Vajjians meet together in concord and carry out their undertakings in concord; so long as they act in accordance with old institutions established in former days; so long as they honor, esteem, revere, and support their old men, and hold it a point of duty to listen to their words; so long as they give liberty to their women, and detain none among them by force; so long as they revere and support their religious edifices, and allow not the proper offerings and rites to fall into desuetude; so long as they protect, defend, and support their religious teachers, and allow others from a distance to enter their realm and live at ease among them—so long as they attend to these duties, they may be expected to prosper and not decline.

Here we have a picture of the polity ("free discussion" and "religious toleration" are two of the leading points) of these republicans before the Christian era. Doubtless much that we read in Strabo and Homer about the piety of the Getæ and the Æthiopians (the Ye-tha of the Chinese, the Yue-chi or Sacæ) may be accounted for in this way. They inherited religious traditions, and they had not let them slip; and from these traditions not only sprang the present fruit of a well-regulated government, but also the treasured belief in the birth of a Deliverer and Teacher, who should appear at the right time, and come as he had been promised, for the world's good.

In conclusion, it is remarkable to find in the Sanchi sculptures that the flag used by these republicans was one with "stars and Union Jack" combined. This can be seen in plates xxviii. and xxxviii. of Mr. Fergusson's work, and is thus described by that writer: "Their banner, with its 'stars and stripes,' or rather stars and Union Jack combined, may be local and peculiar to Sanchi" ('Tree and Serpent Worship,' p. 136, 2d ed.). But it is not peculiar to Sanchi; it is seen at Bharahut (plate xxxii., fig. 4), and it has been discovered—viz., by Mr. Beal in his examination of the Brahmajâla Sûtra—that this flag represents the Standard of Indra, the Lord of Heaven; the stars denoting the universe over which he rules, and the combined crosses the eight divisions of space. Thus the flag denotes the supremacy of Indra, as the "Lord of Heaven," over the field of creation. It is certainly one of the many remarkable coincidences which occur between Buddhism and modern history, that such a flag should have been adopted by the Sons of the Sacæ, united as a republic in India at this early period, as a type of their combined nationality and their righteous government. *Faveat omen!*

PARALYSIS OF PARLIAMENTARY GOVERNMENT.

LONDON, June 29.

SIX weeks have now been spent over the Prevention of Crime Bill, as the new measure for checking outrages and conspiracy in Ireland is called, and the House of Commons has disposed of only half the clauses it contains. It is intended, as your readers will probably remember, to replace the act passed sixteen months ago, under Mr. Forster's auspices, by which the Irish Government was empowered to imprison without trial persons reasonably suspected of certain offences—an act under which outrages had not diminished, and which was regarded both in England and Ireland with constantly growing dislike. The present bill is in some respects a stronger, in others a milder measure. It is milder, in so far as it recognizes every man's right to be tried, permitting no prolonged arbitrary detention on mere suspicion. It is stronger in that it creates certain new offences which it empowers the local resident magistrates to try and punish, and provides for the trial of certain other offences by a commission of judges instead of by a jury whenever the Lord Lieutenant shall be of opinion that a fair trial cannot be had before a jury, besides conferring powers of searching houses, of arresting persons found after dark under suspicious circumstances, and of preventing public meetings thought dangerous to the public tranquillity. In fact, it almost amounts to a supplementary criminal code for Ireland; temporary, however, for its operation is limited to three years.

Although many of the provisions of this bill had been considered months ago, under Mr. Forster's reign, and it was to some extent prepared before the Phœnix Park murders, there can be little doubt that Mr. Gladstone's Government would not have brought it forward in its present form except under the pressure of that catastrophe, and of the horror and anger which it evoked in England. Nor would anything less than that catastrophe have enabled them to pass it, as they now seem likely to do, practically unmodified. The assassination of Lord Frederick Cavendish and Mr. Burke, coming so suddenly after the announcement of a policy of conciliation, and still more the failure of all attempts to discover its perpetrators, well known as they must have been to many persons in Dublin, brought to a head the rising indignation of the English upper and middle class at the impunity which crime has enjoyed in Ireland, and made them willing to adopt almost any means, however violent, for checking it. If the Government had proposed to suspend the ordinary law altogether, and hold drum-head courts-martial over Ireland, they would have found support from the whole Conservative party in the House of Commons, and from a good many of their own adherents. Those who disapprove of their present bill may be asked to remember that it is a far more gentle remedy than many influential voices demanded.

By the Nationalist party in the House of Commons—that is to say, by those thirty to forty Irish members who with more or less individual independence follow Mr. Parnell—it was of course received with vehement hostility. It came very opportunely for them, for Mr. Parnell was in some danger of being discredited with the extreme section of the Irish by his release from prison, after communications with Mr. Gladstone's Government in which he had expressed friendliness to them and a willingness to accept their remedial measures. An Irish leader holds

his post on condition of perpetual combat. He dares not conclude even a truce with what is called "the English Government." To attack and revile that Government, to impede and exasperate the English Parliament, are the main purposes for which he is sent to Westminster, and if he swerves from them, he is liable to be first deserted and then superseded in favor of some more violent and reckless partisan. The moment, therefore, at which Mr. Parnell showed the most statesmanlike view of the situation, and the greatest willingness to obtain by coöperation with the Government substantial benefits for Ireland, was the moment when he ran the greatest risk of losing his hold on his countrymen, or at least on that part of them which professes to act for the whole. Now, the Prevention of Crime Bill was so severe that it gave him fair ground for resuming his attitude of hostility, and enabled him, by the tenacious opposition which he and his friends have offered, to show that there was no compact between him and the Government, no abandonment of the old programme. In this opposition the Irish Nationalists did not at first stand alone. Many English members thought the bill needlessly severe. They were quite prepared, after the Dublin murders, to support any measure, however searching, which promised to grapple with the great evil and danger of the situation—namely, the difficulty, one may say the impossibility, of discovering the perpetrators of agrarian outrage. But they remarked that a comparatively small part of the bill dealt with this problem, a large part going rather to provide different modes of trying prisoners already detected, and heavier penalties for them if convicted. Hence, both on the second reading and in the first days of Committee, several Liberal members, belonging as well to the so-called Whig section as to the more advanced section, spoke, and a still greater number voted along with the Irish Nationalists against the Government. More than half the minority by which the proposal to try treason without a jury was resisted came from the Ministerial side. When, however, it became plain that the Nationalists were using all their resources to delay the passing of the bill by multiplying amendments, and by debating every amendment at immoderate length, the English Liberal Opposition became gradually silent. Admitting that some measure was called for, and perceiving that the Government, with the help of the Tories, was sure of carrying this one, they seem to have concluded that the sooner it was passed the better, and to have desired to dissociate themselves from the obstructive tactics which Mr. Parnell's followers were adopting.

These tactics have been much more skilful than they were upon Mr. Forster's Coercion Bill of sixteen months ago. There has been no obvious and deliberate talking against time, no dilatory motions, unless one can call by such a name the demand that sittings shall not continue later than one A. M. Hence there has never been a time when the chairmen of committees could fairly say that regular obstruction of the old type was being employed, or when the Government could insist that some extraordinary remedy should be applied. However, as not much more than half the bill has been despatched after nearly a month's work, the impatience of English and Scotch members, who see that this session is being utterly lost for all English and Scotch purposes, is becoming very great. Appeals are frequently made to the Government to propose the reënactment of the "Rules of Urgency" of last session, under which the Speaker becomes a temporary dictator, with power to guide the proceedings so as to save time and shorten discussion. But as the Irish members would take up four or five nights at least in discussing the proposal for urgency, it is not clear that much time would be gained by this expedient. Meantime, the sense of irritation, the indisposition to listen to anything, wise or foolish, from the Irish members, grows apace. Debate has become a mere wrangle between some five or six of them, reinforced occasionally by the others, and Sir William Harcourt, who, as Home Secretary and a lawyer, conducts the bill for the Government. Every line of the measure is fought, and no clause passed without several divisions.

The whole affair illustrates very completely the unsatisfactoriness of legislation by an English Parliament for Ireland. Very few of the English members know anything about the points that are raised by the Parnellite opposition. Most of them are of course content simply to follow the Government, and thus to abnegate their duty of taking an independent view of questions which are often really important. This naturally irritates the Irish members, and would be condemned by an observer from any other country. It is the reproach which Ireland always brings against the English Parliament. But, on the other hand, those Englishmen who desire to master the questions involved, and seek to make this new criminal code for Ireland a better code, get no real help from the Nationalist members, for the latter insist with equal vehemence on small points as on great ones, intersperse their arguments with attacks on England and the Government which are usually irrelevant and sometimes insulting, and discuss everything at such inordinate length that human patience gives way. With plenty of ingenuity and cleverness in detail, they show little skill in the strategy of their whole campaign. Sometimes, indeed, people accuse them of not wishing to have any English help, but rather to increase the exasperation of the fiercer spirits in both countries by repelling all sympathy which comes from this side of the Channel, and so accelerating an ultimate separation.

While this is the state of things inside Parliament, the country outside has got tired of watching the House of Commons, and begins to think there must be something terribly wrong, either with representative government in general, or at least with our parliamentary machine. There has rarely been a Parliament from which so much was expected as from this one when it met in May, 1880. It contained an unusual number of energetic and experienced men. The majority which one party enjoyed in it was sufficiently large to make legislation seem easy. That majority was known to be firmly, indeed enthusiastically, attached to its leader. Foreign and colonial complications were disappearing, so that there was every prospect that the whole strength of the Legislature could be turned on to the work, which had lain in abeyance during Lord Beaconsfield's reign, of passing domestic measures of social and constitutional reform. Something was done in the first session, though a large part even of that session was spent on an Irish bill which the House of Lords ultimately rejected. But last session everything was sacrificed to the Irish Land Bill, and this year nothing will be accomplished. The country, which sees that the Liberals are still in a large majority, and that this majority continues loyal to the Government, does not understand why these constant dead-locks happen. It still has faith in Mr. Gladstone—that is to say, the mass of the people who believed in him in 1880, believe in him still; for the richer classes who generally hated him then, hate him fully as much now. And just because it does trust the Prime Minister, and is unwilling to suppose the blame to lie with him, it thinks very ill of its present parliamentary system. Very fortunately there are no pressing domestic questions. Although the agricultural classes have been suffering, their mishaps are due partly to the competition of your Western farmers, partly to a run of poor harvests; so that legislation could not do much to mend their condition. Trade is fairly good, the working classes are pretty well contented; nobody has any pressing grievance to be dealt with. For these reasons the paralysis of the Legislature is borne with more patiently than might have been expected. But it will not be so borne for long. Unless Parliament is made a far more efficient machine for legislation than it has latterly been, the disgust with it will dispose the nation to throw far more power either into the hands of local authorities, or (and this is the more probable alternative) into those of the head of the executive. If Parliament is incapable, owing to its faulty procedure and the interminable dissensions of which it is the scene, to conduct the government of the country, the Prime Minister will tend to become a dictator. It will be strange indeed if the Irish members should give this turn to the development of the British Constitution. Y.

MADAME D'ÉPINAY.

PARIS, June 9, 1882.

No name is more attractive in the eighteenth century than that of Madame d'Épinay. She embodies, as it were, all the spirit of an age, all its wit, its grace, its illusions, its faults, and its charms. She was plain, very plain, as her portrait shows; but she had "la grâce, plus belle encore que la beauté," to use the words of Voltaire. M. Lucien Perey and Gaston Maugras, who published last year the correspondence of the Neapolitan Abbé, Galiani, became very much interested in Madame d'Épinay, who was the faithful friend and correspondent of Galiani. They found out a M. Édouard d'Épinay, great-grandson of Louis de la Live d'Épinay; they made the journey to Fribourg and Grandfey, a little château in the neighborhood of Fribourg, and they discovered there some letters and documents which were still inedited. They made researches in our archives and in some private collections of autographs. The authors of this new volume* have taken much trouble in collecting many details concerning Madame d'Épinay. They have really not given us a new Madame d'Épinay; they have not added even any important touches to this curious historical figure; but it is now the fashion to write books of certain personages without any provocation. The eighteenth century is the fashion, and it must be confessed that we always like to live for a little while in imagination in a society which, with all its defects, had a charm unknown to our time.

Mlle. d'Esclavelles, who was to be Madame d'Épinay, was born on March 11, 1726, at Valenciennes (the authors of the book have carefully certified this date). Her father was a veteran soldier, who, in his old age, had been appointed governor of the citadel. When the child was ten years old, the family came to Paris. The sister of Madame d'Esclavelles had married a *fermier-général*, M. de Bellegarde, who was very rich, and had a splendid house in the Rue Saint-Honoré. The wretched character of Madame de Bellegarde made Mlle. d'Esclavelles very unhappy. She could not remain with her, and was placed in a convent by her tutor, M. d'Affry. Madame de Bellegarde died suddenly, and from that time the house of M. de Bellegarde became hers. Her cousin, M. de la Live, who married her afterward, took at that time the name of D'Épinay, from an estate which his father had bought for him near Saint-Denis. She was thought by her family to have made a *mésalli-*

* 'La Jeunesse de Madame d'Epinay. D'après des lettres et des documents inédits.' Avec un portrait. Paris: Calmann Lévy; New York: F. W. Christern.

ance, but D'Épinay had the promise of the *survivance* of the place of *fermier-général* of his father Bellegarde. He was handsome; he was amiable. The honeymoon was not long. Young D'Épinay very soon returned to the society of his friends and of his former mistresses. He went out every night and returned very late, sometimes drunk; he stole the pocket-money which Madame d'Épinay kept in her own secretary; he played constantly. Madame d'Épinay was very unhappy at first, but all her friends told her that it was not in good taste to take such trifles tragically: D'Épinay took his freedom, and she could take hers. She allowed her husband to take her to the Opéra ball; she received her first love-letters from the intimate friends of her own husband. D'Épinay was obliged to travel for months in France in the exercise of his functions of *fermier-général;* he told his wife on his return of all his "successes" (*bonnes fortunes*) in the provinces. What an education for a young, sensitive, naturally refined, and delicate young woman. There are some things which cannot be repeated, and which proved to Madame d'Épinay that her frivolous young husband was absolutely devoid of moral sense; he was a naïvely corrupt child, and all the elegance of the *fermier-général* could not conceal the terrible vulgarity of his nature.

Madame d'Épinay retired to the Chevrette, a place in the country which owes its fame to her. She was not reconciled to her position; she was alarmed by the follies of her husband. Whenever she made a visit to Paris she had some new proof of his infidelity. On September 29, 1746, she had a son, but, after the fashion of the time, the child was immediately sent out to nurse. D'Épinay tried at times to console her. "My dear friend," said he, "you have no notion of the world and of its usages. Is there anything in common between a creature who can be had for money and whom you leave when you don't want her any more, and a woman whom you esteem and whom you have chosen?" He cited the names of all his friends who had mistresses. Madame d'Épinay could only answer by crying.

Mlle. de Bellegarde, who was a great friend of Madame d'Épinay, married M. d'Houdetot, and the history of this marriage, as told in 'La Jeunesse de Madame d'Épinay,' is very characteristic. The two young people had absolutely nothing to do with the arrangements. The two families met before them, talked and discussed like notaries, and they had nothing to do but to assent. D'Houdetot made his wife very unhappy; he had a mistress, and kept her. He was brutal; he gambled constantly, and he contrived to spend the greater part of his wife's fortune. He was obliged to accept, as the world did before him, the *liaison* of his wife with the famous Saint-Lambert. The friends of Madame d'Épinay were no better than her relatives. One of the worst was the famous Mlle. d'Ette, of whom Rousseau says: "She was wicked, and lived with Valory, who was not good." Diderot compares her, on account of her beautiful complexion, to a cup of milk spread over with roses. "The Chevalier de Valory," he says, "took her from her father's house when she was fourteen; he lived with her, dishonored her, gave her children, promised to marry her, and abandoned her."

Madame d'Épinay had a daughter in June, 1747. Her husband was away at the time in the provinces; she was living with Mlle. d'Ette, with Valory, and with Francueil. Mlle. d'Ette soon perceived that Francueil was in love with Madame d'Épinay, and she saw in this passion a way of establishing herself in Madame d'Épinay's house. She became the confidante; she helped Francueil; she informed Madame d'Épinay of her husband's conduct. There are some details concerning this wretched profligate which I cannot repeat here, and which must be sought in the book. It is enough to say that, if any woman ever can have an excuse for breaking the ties of matrimony, Madame d'Épinay had it. She was naturally good, and even innocent; but she was finally spoiled, like a good peach among rotten peaches.

Francueil became her consoler. He was one of the most accomplished gentlemen of his time; he was handsome, intellectual, a good musician, a good actor, passionately fond of art, of letters, of science. He was the eldest son of Dupin de Chenonceaux, a *fermier-général*, who had one of the best houses in Paris (he lived in the Hôtel Lambert, now inhabited by Prince Ladislas Czartoryski). Friendship soon became love. M. d'Épinay, on his side, continued his disorderly life. The "séparation de biens" (separation of fortunes) was pronounced between them by the Châtelet of Paris on May 14, 1749. D'Épinay's conduct became so gross that the Minister exiled him to Poitiers by a *lettre de cachet*. Madame d'Épinay became absolutely free; she became acquainted with Duclos, with Mlle. Quinault, with the Comte de Caylus. Duclos was the son of a watchmaker; he was born at Dinan, in Brittany; he made himself famous by his wit at the Café Procope, in the Latin Quarter, where he lived with Crébillon, Piron, and others; he was received into the best society. Duclos soon became a very important *arbiter elegantiarum* at the Chevrette. He was in love with Madame d'Épinay, or affected to be; she was imprudent enough to confess to him her passion for Francueil, and Duclos profited by it and became a sort of tyrant. Mlle. d'Ette describes thus life at the Chevrette: "One hears nothing here but comedy: one repeats his part, another tries on a dress; everybody is in love. This society is like a moving novel. Francueil and the little woman [Madame d'Épinay] are drunk with love as on the first day. Gauffecourt, the old dog, makes languid court to the indolent Madame de Jully. . . ."

The moral sense of Duclos was very obtuse, to use the mildest expression; he treated Madame d'Épinay with a *sans-gêne* and a brutality which are perfectly revolting. Still, she did not know how to get rid of him. She fortunately made the acquaintance of Grimm, at a moment when her difficulties had become extreme. Her fortune was greatly compromised by the prodigalities and vices of her husband. The good M. de Bellegarde, her father in-law, had died; her sister-in-law, Madame de Jully, had made herself notorious by a passion for the actor, Jélyotte, and had died of the small-pox; Francueil, the beloved Francueil, was unfaithful, and spent much of his time with the dancer who was the mistress of M. d'Épinay—it seemed amusing to him to be his rival everywhere. When Madame d'Épinay learned this last news from the mouth of Duclos she became ill, and she dismissed Francueil forever. Grimm saved her. He took by degrees possession of her soul; he dictated her conduct; he banished Duclos; he warned her against Rousseau; he surrounded her with an intelligent society, with less frivolous people. "It must be admitted," say the authors of 'La Jeunesse de Madame d'Épinay,' "that Grimm conducted himself admirably with Madame d'Épinay. He remained her most faithful, her safest friend; but we believe he was not in love with her. The true passion of his life was the Empress Catherine."

Rousseau was very ungrateful to Madame d'Epinay. He read the manuscript of his 'Confessions' in the winter of 1770–1771 in various houses in Paris. In these 'Confessions' he was very hard on Madame d'Épinay; he went so far as to say that, if he had refused to accompany her to Geneva, it was because she went there in order to conceal the birth of a child, of whom Grimm was the father. The archives of Geneva have been carefully searched, and no trace has been found of the birth of this child. The famous Tronchin was the medical adviser of Madame d'Épinay in Geneva, and admitted her to his intimacy; he certainly would not have lent himself to what Rousseau suspected. Besides this calumny, Rousseau attacks Madame d'Épinay with the greatest severity. He represents her as false, intriguing, capable of every bad action. Madame d'Épinay was so offended by the 'Confessions' that she asked M. de Sartine, the Minister of Police, to forbid their being read in so many houses, and M. de Sartine gave her this satisfaction. Madame d'Épinay had already begun her 'Memoirs,' but she then went over them again and finished them, perhaps with a view to answering the 'Confessions.' She only read them to a very small circle of friends, and the candor of so many confessions shows plainly enough that they were not intended for the publicity which they afterward found. Grimm, who was the universal heir of all her manuscripts, did not publish them. A manuscript, bought and published in 1818, thirteen years after the death of Grimm, by two booksellers, Brunet & Parison, was found among the papers of an old secretary of Grimm's.

Correspondence.

THE METROPOLITAN ALCAZAR.

To the Editor of The Nation:

Sir: My attention has been called by some frivolous literary persons to an article in your journal which is, it seems to me, not only inaccurate in many of its assertions and insinuations, but calculated to do me serious injury. I feel convinced that your sense of justice and propriety will compel you to give the same publicity to my reply that you gave to the ill-considered remarks of the writer of the article in question.

While it affords me the greatest pleasure to satisfy the æsthetic tastes of the citizens of New York, honesty compels me to admit that one of my objects in carrying on this business is to make money, and, while I regret that the two or three thousand persons who visit the Alcazar persist, as you say, in giving offence to those who are dining by looking across, and even at, their tables, I cannot, in justice to my associates, take any steps to keep them away. If you cannot improve their breeding, I am afraid that any poor efforts I might make would be thrown away. In the matter of crowding and etiquette, we only do the best we can.

But when your writer insinuates by a cleverly-turned phrase that the quality of the sherry furnished to our visitors is not good, I request, in return, to say to your readers that only the grossest ignorance of his subject can justify his remarks. The sherry which is put on the table at the Alcazar dinners is not only exceedingly good, but so good that a bottle of it would fetch in the open market more than we charge for the whole dinner.

As a wine merchant of some thirty years' experience, I feel entirely justified in saying that no other *table d'hôte* in town has wine as good as ours, and that the fashionable eating-houses ask three or four times the money for articles of the same value.

In fact, you have, I dare say inadvertently, done me a serious injury, and the cause of true temperance a real harm, in so belittling and decrying my honest effort to educate the citizens

of this country up to a better standard in their drinking habits, while making a modest living for myself. I feel sure that you will reëxamine the matter and do what is right.

Yours respectfully,

TIMOTHY STEVENS.

NEW YORK, July 3, 1882.

[What Mr. Stevens complains of is our remark that "not even the announcement of the present management that it will give half a pint of 'Bodega sherry' with the dinner can keep people away." He seems to overlook the fact that any injustice we may have done through this remark was amply offset by our saying nothing whatever about the ballet.—ED. NATION.]

THE ATHENIAN NAVAL ARSENAL OF PHILON.

TO THE EDITOR OF THE NATION:

SIR: The Σφαῖρα of the Peiraieus of May 28 (June 9) last gives in full a long inscription just found at the extremity of the harbor commonly known as Zea, which contains, apparently, specifications to the contractor for the building of the great naval arsenal of Philon, mentioned by Æschines, Strabo, and Plutarch, among other ancient writers. The inscription was laid before the Helikon Society of the Peiraieus on June 7 by its discoverer, Mr. Alexander Meletopoulos. If it can be shown to have been found upon its ancient site, it will go far toward settling the still vexed question of the certain identification of the various Athenian harbors in favor of the solution adopted some time ago by prominent German scholars; but the Σφαῖρα does not enlighten us upon this point. In the meantime, the inscription is of high interest, as giving entirely new information regarding Athenian architecture in the middle of the fourth century before our era; and it will, if authentic, which there seems to be no reason to doubt, afford much material for archæological study.

I give those details of the plan and construction of the arsenal of which the interpretation seems certain; omitting, for the present at least, many doubtful points, some of which are not the least important.

The arsenal of Philon, son of Exekestides of Eleusis, was situated, according to the new inscription, upon the harbor of Zea, near the propylaion leading from the agora of Hippodamos. The building was 400 (Attic) feet long and 55 wide, including the exterior walls, which were 2½ feet thick. The foundations were built with much care of hewn stone, and upon them was laid a directing course or base (εὐθυντηρία) for the walls, projecting somewhat beyond them, and 1½ foot high. Upon this first course was a second, 3 feet high (ὀρθοστάτης), the uniform height of each course above being 2½ feet. The length of the blocks of all the courses, except at the angles, where their length was made to correspond with the position of the second triglyph of the Doric frieze, was 4 feet. The whole height of the walls, from the top of the first course to beneath the cornice, was 30 feet. At either end of the building was a front with a pediment, and in each front were two doorways only 2 feet apart, each 9 feet wide and 15½ high. The lintels, side-posts, and sills were of marble, the rest of the exterior of the arsenal being of Peiraic limestone. The doors themselves were plated outside with bronze. There were windows all around the building—one opposite each interior intercolumniation on the sides, and three in each front. The windows were three feet high and two feet wide, and were fitted with bronze shutters.

The interior was divided into three long aisles by two rows of columns 30 feet high, including their capitals, and standing upon a stylobate of equal height with the base-course of the exterior walls. The lower diameter of the columns was two feet and three palms (of about three inches each); they were composed each of seven drums four feet high, except the first, which was five feet—leaving one foot for the height of the capital. The middle aisle was 20 feet clear in width between the rows of columns. The capitals were of Pentelic marble, and the shafts of limestone. There were 70 columns in all—35 in each row.

The epistyle was solidly constructed of wooden beams, and similar beams, spanning the middle aisle, appear to have rested immediately upon the capitals. The inscription adds technical details of the construction of the ceiling and of the timber framework which supported the tiled roof. Over the doors at either front the ceiling was of Hymettic marble.

The floor was evenly paved with stone. Between each column and the side wall was a stone barrier three feet high, forming a double row of small bins along the sides of the arsenal, each bin being provided with a gate. There were two tiers of supports extending from the columns to the side walls, for the storage of the naval undergirding straps (ὑποζώματα); and as these supports were at a considerable distance from the floor, wooden ladders were provided to give access to them. There were 134 chests for sails and for the white side-curtains (παραρρύματα) of the ships, placed one against each column, and the others opposite. These chests were made to open in such a way that their contents could be inspected at once, when necessary, by those passing through the arsenal.

To secure ventilation, spaces were left open at the joints of the wall blocks at certain places indicated by the architect. These ventilating apertures would form an interesting parallel to those existing in the lower courses of the Erechtheion, which are, however, pronounced modern by the latest authorities.

I am, sir, very respectfully,

THOMAS W. LUDLOW.

COTTAGE LAWN, YONKERS, N. Y., July 10, 1882.

Notes.

HARPER & BROS. will be the American publishers of a work entitled 'Travels in South Kensington, with Notes on Decorative Art and Architecture in England,' by Moncure D. Conway. It will relate the history of the Museum in that suburb, and be fully illustrated.

G. P. Putnam's Sons, who for thirty years have had Hood's works on their list, have brought out, in the prevailing quarto form and paper covers, 'Hood's Own,' a medley of prose and verse still irresistibly mirth-provoking in spite of the long silence that has followed the reign of the punster. Hood's designs are reproduced, and are even more striking evidence than the text of the growth of the public taste.

The seventh edition of 'Appleton's Dictionary of New York' exhibits no changes that call for special remark, though there is a steady improvement in classification. The editor may be reminded that he has not kept pace with the census in the case of the suburban towns whose population he attempts to give. His style also will bear amending; as (p. 158), "an appetite which grows upon what it feeds"; and (p. 159), "a place . . . which contains some of its finest residences, which use the grounds adjacent in common." There is a singular absence of dates in connection with the removal and setting up of the obelisk in Central Park.

Vol. 134 of the *North American Review* deals with the timely topics of the past six months—the Guiteau trial and the moral responsibility of the insane, the Geneva Award, civil-service reform, the Navy, repudiation in Virginia, etc.—and some which we have always with us, like prohibition, homœopathy and old-school, woman's right to practise medicine, vaccination, the Christian religion, etc., etc. The index, in spite of apparent diligence in the cross-references, still leaves much to be desired. Let any one, for example, try to ascertain at a glance how many articles were written on the question of insanity.

From a paper on Constables, by Mr. Herbert B. Adams (one of a series on New England tithingmen, selectmen, mayor and aldermen, published in the *New England Historical and Genealogical Register*), we learn that a number of graduate students at the Johns Hopkins University are now studying coöperatively the local institutions of their respective States or sections. Even Canada is represented in this inquiry.

It may not be generally known that there is a semi-monthly periodical publication in raised letters for the blind—*Kneass's Philadelphia Magazine*. The editing of such a publication calls for far greater tact and discrimination than are expected of the ordinary journalist. The blind cannot skip.

The Society of Decorative Art of California offers several prizes for embroidery and designs appropriate to interior decoration. Goods are receivable from October 30 to November 1. Particulars may be obtained by addressing Prize Design Competition, 631 Sutter Street, San Francisco.

Mr. George W. Cable, the well-known novelist, in a commencement address at Oxford, Miss., discussed very frankly the question of "Literature in the Southern States." One slip, made in the interest of local color, was curious. Mr. Cable mentioned "Sargent S. Prentiss, of Mississippi," as among the "brightest lights in the firmament of American letters," "placed there by the Southwest." But Mr. Prentiss had first placed himself in the Southwest by quitting his native Down East of Maine.

The general catalogue of Colby University has two interesting tables, one giving the occupations and the other the residences of graduates, from 1822 to 1882. 194 are deceased. Of the remaining 536, of course the most were clergymen, 219, to which class ought to be added 11 missionaries. Next came lawyers, 158, and 14 judges; teachers, 120, and 8 superintendents of schools; physicians, 44; presidents and professors in colleges, 41; journalists, 32. Politics claims 2 governors, 8 M. C.s, and 1 United States collector. There are also 11 women. The other occupations are too thinly patronized to be mentioned.

—A brother of the late Col. Joseph L. Chester informs us that the latter received the degree of LL.D. from Columbia College several years ago, and that of D.C.L. from Oxford University last year.

—Adolph Count Zedwitz writes us from Döbling, near Vienna, under date of June 12, as follows (in translation). The subject is our recent article on vaccination. The communication calls for no comment:

"I beg leave to say, concerning Professor Vogt's table in No. 872 of the *Nation*, that this table, together with some other insignificant mistakes in calculation, pardonable in so vast a labor, were corrected by Professor Vogt himself in his second work, 'The Old and New Vaccination Doctrine.' But it seems quite unimportant whether before Jenner the rate of mortality was larger or smaller, as protection by vaccination could not be proved until recently. Why do the believers in vaccination lay so much stress on unessential side issues, and not refute the other

tables of Professor Vogt, which prove the absolute valuelessness of this silly practice? However, I am well aware that medical quackery is worse in the United States than with us, and vaccination is quite consistent with it."

—Mr. T. W. Higginson will begin in the August *Harper* a series of historical papers which will constitute, we understand, the most extended work ever yet undertaken by this writer. In connected form they will add another to the many histories of the United States, closing for the present with the opening of the anti-slavery agitation, or, say, the year 1830. The work has been suggested by the urgent calls from many quarters for a book on the same general plan with Mr. Higginson's 'Young Folks' History of the United States,' as to simplicity and readableness, but on a much larger scale. The opening number, called "The First Americans," is the first attempt at a popular statement of the new view of American archæology, inseparably connected with the genius of Lewis H. Morgan, which regards all the aboriginal races, from Digger Indians to Aztec, as essentially one race, to whose characteristics the Pueblo Indians afford the key. The second chapter will be entitled "The Visit of the Vikings," and the third "The Spanish Discoverers."

—Macmillan & Co. have recently issued two books for children which will serve to relieve the tedium apt to overtake the happiest idler in vacation-time. One is Mrs. Molesworth's 'Summer Stories'; the other, Mrs. Mary Steadman Aldis's 'The Great Giant Arithmos.' Parents who have once made acquaintance with Mrs. Molesworth are prepared to take anything from her pen on trust. Whatever else it may be, her writing is sure to be refined in spirit and expression; but undoubtedly also, besides this, she has the story-teller's art in a high degree. There are five of these summer tales, the supposed invention of a group of cousins in an English country-house, and told after tea out of doors. There is a mild ghost story and a fairy story, and three realistic narratives with a very just feeling and some pathos. The variety is remarkable. The youth of the audience aimed at is really below that of the supposed relators, but, as often happens, children in their teens will enjoy this book along with their little brothers and sisters, and will be repaid for the dutiful trouble of reading it aloud to them. To mothers Mrs. Aldis addresses herself, wishing to induce them to retain the privilege of instructing their darlings, and to aid them in grounding these in the troublesome branch of arithmetic. The book *must* accordingly be read aloud, and attention is secured by means of expected responses to questions or pauses, by an apparatus of bricks, crayons, etc., but above all by ingenious episodes, which gratify the juvenile mind for "stories" even in the midst of calculation. At intervals, too, the mother permits the child to look at the humorous pictures which help along the fun and the comprehension. The summer is a particularly good time for using such a text-book as 'The Great Giant Arithmos.'

—The French elections of a year ago have made it seem expedient to issue a supplement to Vapereau's 'Dictionnaire des Contemporains' (New York: F. W. Christern). It is a matter of forty-one pages, and may be cheaply had at a cent a page. The new members of the French Parliament furnish the greater number of fresh celebrities, and for the rest we have continuations of previous notices down to October, 1881, or termination by death, as in the case of Carlyle, George Eliot, Dean Stanley, Drouyn de Lhuys, Duvergier de Hauranne, etc. American events of the previous year caused the insertion for the first time of President Garfield and President Arthur. The latter is accused of having declared for General Grant, who was trying on (*posait*) his "third and illegal candidacy." More explicitly still, in the article on Garfield, it is stated that General Grant was, "contrary to the Constitution," running (*se portait*) for a third term. This is not quite accurate, but there can be no doubt, as stated, that Guiteau "se déclarait 'le stalwart des stalwarts.'" We regret to miss Mr. Blaine still from among the contemporaries. But the revelations concerning his South American diplomatic performances since the date of closing the Supplement can hardly have been overlooked by the vigilant editor, and must cause him to be recognized in the sixth edition of the Dictionary.

—B. Westermann & Co. send us the concluding parts, 31 and 32, of 'Stieler's Hand-Atlas.' They embrace maps of the regions bordering on the upper Adriatic (S. W. Austria-Hungary, with Bosnia and Herzegovina nominally assigned to Turkey), the East India Islands, the Chinese Empire, and South America from Valparaiso to Cape Horn, together with a title-page of which even the ornamentation is made instructive by exhibiting various modes of projecting the globe. All the maps mentioned are noticeably fine and fresh. Vienna, Peking, Valparaiso, and Lima are among the side-maps on an enlarged scale, and the Dutch possessions in the East are magnified by comparison with the Netherlands on the same scale: the mother country is hardly larger than Atchin, the northern tip of Sumatra. This ever-improving work first appeared in 1817, when fifty plates were sufficient for the needs and knowledge of the time. Now ninety-five are not enough, for a Supplement in three parts and eight sheets delineates the Mediterranean basin with a liberal measure. This supplementary chart, by the way, acquires a present interest by reason of the bursting of the war-cloud at Alexandria, not to say also at Constantinople. Every country which could by any pretext take part in the campaign against Arabi is here represented, except the one which will bear the burden of the fighting—England—and the one which can exert the greatest moral influence on the course of events—Germany. It would be superfluous to praise an atlas rectified for more than half a century at short intervals, and produced by the foremost establishment of our time with all the resources of art and science. Unquestionably, the novelty of the edition now closed is the thorough overhauling of the South American maps, the weakest point in the series hitherto. The United States, in six sheets, has had the benefit of the numerous determinations of our national surveys. It should be added that the nomenclature of the work is in general that of the country depicted, with parallel names subjoined in certain cases. For the world at large, there is no better or cheaper atlas.

— The Boston Monday Lectureship has been transferred to Japan, where it has been heard on the question, "Does Death End All?" The *Chrysanthemum*, a monthly periodical of Yokohama, says the treatment was masterly, and must have been "productive of good to foreigner and native alike." But the Buddhist *Jiji Shimpo* was not so affected by it. A writer, who professes to be "a believer in Buddhism and an opponent of Christianity," asks in that journal:

"What is this whose Samson-like blasts and Demosthenes thunder shake the hall? Is it the personification of Hercules? Nay, it is the man called Joseph Cook! On the 3d instant he delivered a speech in the *Meiji Kŭaido* whereby I myself and the whole audience were astonished to stupefaction. After mature consideration of his speech I find him just like John's cousin, for the substance of his myriad words amounted to nothing more than the elaboration of the following points. . . .

"This is the substance of Mr. Cook's lecture, and thus shallow is his thought. In the first place he confounds emotion and intellect. For the worship of ancestors and the belief in immortality are the results of mere emotion. . . . Macbeth saw a ghost, therefore Mr. Cook believes in ghosts. Swedenborg saw lots of angels, therefore he believes in angels! In the second place, he confounds past and future. He holds that what was not yesterday will not be to-morrow. Why, 1300 years ago no one believed that the earth was round. But Copernicus found out by investigation that the earth was really round. What does Mr. Cook think of that! . . . How very stale his trite utterances, which a Spencer or a Bain could demolish with a blow! He ought to reflect a little more. In the third place, he confounds the general with the particular. The Christian is not the only religion which discusses the facts of the human soul. Why, even American Indians, to say nothing of Mohammedans and Buddhists, teach these facts of man's spiritual life. The Buddhist doctrine of rewards and punishments is certainly more logical than any other. Oh! there's nothing in Mr. Cook's assertions. The reason why so many were overwhelmed and fascinated was nothing more than the effect of his uncommon presence and eloquence."

—The easy reconciliation of religion and science exhibited in the funeral discourses over and concerning the late Charles Darwin shows to what an extent the rational and blameless life has achieved at least a post-mortem immunity from the theologians. In fact, so far as the scientist has any interest in this reconciliation, it may be said to lie in watching the process by which, one after another, the religious teachers justify their indifference to doctrines so abhorrent to them twenty years ago. The late lamented Lewis H. Morgan was, as is well known, an independent and valuable contributor to the Darwinian theory of the descent of man. This fact gave no trouble to the clergyman, the Rev. Dr. J. H. McIlvaine, a very intimate friend, who delivered the address at his funeral last December, as the following passage bears witness:

"I do not understand that his results, with reference to the length of time during which the earth has been inhabited by human beings, or with respect to the low condition out of which they have gradually risen, are in anywise opposed to Scriptural intimations. I cannot find any sufficient data in the Scriptures for a revealed chronology. Upon this point, as I understand, science is left perfectly free to discover by her own methods how long man has been on the earth. Neither, as I read the first chapters of Genesis, does it appear that man was created in a high state of development, though certainly in a state of innocence. There he is represented as without experience and without tools or instruments, and as not having commenced his work of subduing nature to his own uses and ends, through which only is human development conceivable. He does not appear to have been able to make his own first suit of necessary clothing—it had to be made for him. Nor does it appear that he had the speech-faculty in full development. Hence the creatures were made to pass before him that he might name them; which took place, as I understand, for the purpose of evoking his faculty of speech."

—No little interest has been manifested in New England in the case of Joseph Stickney, guilty of murder in Colorado under peculiar, if not extenuating, circumstances. What may be called his sociological *dossier*, drawn up by the hand of one of his relatives, has just been printed in the *Granite Monthly*, of Concord, N. H., for July. A chart shows his "ascendants" for seven generations, each individual being assigned a number, and 174 out of the 254 being described with more or less particularity in short biographies. There is no other country in the world, and perhaps no other section than New England, where so extended a pedigree could be produced for a common citizen, and with so little difficulty or so much certainty. The compiler calculates the

longevity of the ninety ancestors whose ages are known, and finds the average duration to have been sixty-eight years and five months. Only two are known to have died unnatural deaths, and only two to have drunk to excess. "None are known to have been insane, or to have died of consumption, or to have been divorced." Very few came under the censure of the law, nor can the nature or heinousness of their offences be now accurately judged. On the whole, therefore, the case of Joseph Stickney, on the Guiteau theory of defence, is one which clearly calls for hanging. If, nevertheless, "family influence" could be invoked to save him from this disgrace, the chart shows that his ancestors were also those of the Peabodies, Channings, Danas, Fessendens, Storys, Choates, Eliots, Otises, Bellowses, Winthrops, Tyngs, Buckminsters, Holmeses, Phillipses, Brookses, and many other great lines. Among the more remarkable names are No. 243, Tristram Coffin, the founder of the Nantucket family; No. 235, Rev. Nathaniel Ward, the "Simple Cobbler of Agawam" and the author in 1641 of the "'Body of Liberties,' the foundation of Massachusetts law"; No. 233, Gov. Thomas Dudley; and No. 115, Rev. John Woodbridge, an early master of the Boston Public Latin School. Ruth Eastman, among the female progenitors, stands out for precocity. "Her first child was born when she was 13 years, 4 months, and 26 days old; after marriage [she] played with other children." She was the great-grandmother of Senator William Pitt Fessenden.

—The Census Office has recently published, as a portion of the report upon "Power and Machinery Employed in Manufactures," a report by Mr. George F. Swain upon the water-power, actually in use and potential, of the South Atlantic watershed. It treats of the streams flowing into the Atlantic south of the James River, and opens with a brief account of the topography, climate, vegetation, etc., of the region; matters which are more or less germane to the subject, inasmuch as they determine the amount and character of the flow of the streams. This is followed by a discussion of the relation between the amount of rainfall and the flow, in which Mr. Swain attempts to obtain factors for deducing the annual flow from the rainfall. He expressly cautions the reader, however, against accepting his figures as more than the roughest approximations to the truth. The body of the report is taken up with descriptions of the several streams and their drainage-basins. The slope of the bed, as ascertained from levels, its lithological character, the topography of its immediate banks and that of its drainage-basin, with the climate, soil, and vegetation of the latter, are fully set forth. Tabulated with each stream are the utilized water-powers upon it, while eligible sites for further improvements are pointed out. One very important general fact, though not by any means a new one, is set forth very fully in Mr. Swain's report. That is, that along the line of junction of the older metamorphic rocks with the recent tertiary and quaternary deposit—a line which has an average position perhaps 100 miles from the coast—nearly every stream has falls or rapids; and that it is here, at the "fall line," that the most available water-powers are to be found. Below this line the streams are invariably sluggish. The Potomac passes this line in the twelve miles above Georgetown, D. C., where are found the Great and Little Falls; the James passes it at Richmond; the Roanoke at Weldon, N. C.; the Neuse at Smithfield; the Cape Fear near Averysboro; the Savannah at Augusta, etc. Above the "fall line" the currents of the streams are much more rapid than below, and increase, in general, toward the mountains, affording large numbers of available powers. This report will doubtless add greatly to the interest now being taken in cotton-manufacturing in the South, as it brings to light the vast amount of water-power now lying idle in a region which has been supposed to be rather deficient in that element.

—Recent numbers of the London *Spectator* have contained very interesting communications on the relation of exercise to brain-work. Nothing like a general rule can be evolved from them, because individual temperament, employment, and circumstances create an endless variety of cases that no rule could cover. The more witnesses, however, the greater the chance that the inquirer will find a hint suitable to himself, and it is every one's experience that such hints often determine the happiness of a lifetime. The author of 'The Duties of Women,' a great believer in physical exercise, thinks that it "need not and cannot well be taken *on the same days* when the heavy mental work has to be done." Mind and body may best be strained alternately, by days or by seasons. Especially does she hold that every woman should provide for some perspiring exercise—"a natural Turkish bath"—at short intervals. An Oxford man advocates pleasurable *change* as the chief element of recuperation, more important than the muscular exercise; for which reason he prefers horseback and bicycle riding to walking. His rule is—"One hour of some thoroughly good form of exercise every day, and every week several additional hours' 'change.'" Another contributor has "uniformly found that reducing the diet, and especially avoiding the too free use of heat-producing foods, if not an equivalent for the lack of exercise, at any rate enables one to pursue one's desk-work in comfort, with efficiency, and without harm accruing."

—No doubt there is sense in all these suggestions, and some are within the reach of every one. We should ourselves lay stress on the advantage of a thorough gymnastic training as the basis of all subsequent modes of exercise. The muscular tone of the system once established in this way can be maintained with a minimum of effort and time by the chamber use of clubs, dumb-bells, or even simpler contrivances. The back, the chest, and the abdominal organs, which are the chief sufferers from sedentary pursuits, can thus be directly addressed in the countervailing exercise. If to this can be added a short half-mile run in the open air, the account will generally be found squared daily for any but exhausting mental exertion. The rule, "impletus venter non vult studere libenter," is of course as good for exercise as for brain-work. Beyond this it is hazardous to dogmatize. Some cannot safely take a long walk on an empty stomach, or before breakfast; to others nothing is easier, more exhilarating, or apparently more harmless. Some walkers have only rambling thoughts while on the road; others do their best and closest thinking under such circumstances. Rousseau belonged in the latter class: his mind needed the motion of the body to stimulate it to its utmost. Yet he was not jaded by this two-fold activity, and was, moreover, alive to the passing beauties of the scene: he did not overlook the wayside periwinkle. With some the morning and daylight hours are best for intellectual performance; others require the silence of the small hours of the night. Any one who can order his habits to suit his idiosyncrasies, physical and mental, has no excuse for running down from lack of proper exercise or from over-exercise. Among all the felicities of Darwin's life, this ability was certainly one of the most enviable and the most profitable for mankind.

—The *Progrès Médical* of Paris has commenced the issue of a "Bibliothèque Diabolique" with a pamphlet of 38 pages entitled "Le Sabbat des Sorciers," by Bourneville and E. Teinturier. Considering the source from which it comes, we hoped that it might supply a real want in the history of superstition by examining the beliefs of the sixteenth century with the aid of modern scientific knowledge of hysteria and its allied nervous disorders. In this we are disappointed, for the *brochure* consists simply of a patchwork of extracts from the works of Bodin, Boguet, and other well-known demonologists, so carelessly edited that the sources are frequently not indicated, and we are left altogether at a loss to know whence are derived the illustrations which are lavishly given, except in the case of a folding plate at the end, which, we are informed, is derived from the veracious "Histoire des imaginations extravagantes de M. Oufle." The quotations thus put together supply a sufficiently comprehensive statement of what were believed to be the details of the witches' Sabbath, though the list of authorities cited might have been greatly extended, and the interest and value of the work would have been much enhanced by showing the practical unity of these superstitions in Spain, Italy, Germany, and England with those of France, to which the editors have confined themselves. Indeed, unless the editorship of future numbers is vastly improved, we can see little use in the series, for students of the subject are already familiar with the material presented, and the general public can take no interest in a mass of bald quotations without illustrative introduction or explanatory notes.

— The Société Bibliographique has done a useful work. It has published a 'Catalogue des Livres choisis à l'usage des gens du monde, contenant les meilleures productions de la littérature contemporaine,' a book of 183 pages, and costing only two francs, and yet one which the Society has been ten years in completing. The idea is like that of the proposed "A. L. A. catalog," and the experience of the Société Bibliographique resembles in all but one point what is rumored to have been the experience of the American Library Association. Numerous collaborators succeeded one another, leaving their unfinished work to successors who were compelled to recast it all, and every gap of any length required a fresh delay while the literature that had appeared in the meantime was examined and inserted. Whenever the Society found a man competent to give them any assistance, they applied to him to take charge of the section best suited to his special knowledge; and the response, even if it was in the affirmative, was not necessarily prompt. The one point of difference between the two societies is that the French catalogue after ten years is published, and the American catalogue after five years is in a fair way of being given up. The *Polybiblion* last May, in noticing this 'Catalogue,' gave a short bibliography of previous French attempts of the same sort. A dozen catalogues are mentioned, of which the most noteworthy was the R. P. Jean Baptiste Boone's 'Les mauvais Livres, les mauvais Journaux et les Romans, avec un catalogue de mauvaises publications périodiques et de mauvais livres, et une liste des romanciers du jour,' which reached a fourth edition. All of the others tried to print good literature. Boone alone had the courage to denounce bad books by name, and to run the risk of serving as a guide-post to those who demand nothing better than to have the way of perdition made plain before them. Probably he knew that such persons would get the knowledge which they

covet whether he gave it to them or not; that he was not really hurrying them forward in their path, and that he might be furnishing a beacon to some who were willing to be warned. The present list, however, takes the wiser course of pointing out the good books; the chief objection to be made to it is that there are not enough. Three thousand works would be a large library for one man; but this list, which is classified, is intended to serve many men of many tastes, and to show them which are the best books on a very large number of subjects. It is not credible that there are in French literature only 3,000 "best books." Perhaps a second edition, which will of course be needed in a few years, if only for the insertion of the literature of the demi-decade, will be fuller.

SANBORN'S THOREAU.

Henry D. Thoreau. By F. B. Sanborn. [American Men of Letters.] Boston: Houghton, Mifflin & Co. 1882.

MR. SANBORN'S volume may be considered as a vindication, a criticism, a eulogy, or a biography; and in no one of these aspects is it a very successful literary performance. Thoreau's life was absolutely without incident, and where it might gain interest from an account of the lives of men with whom he was thrown, Mr. Sanborn fails to take advantage of his opportunities. He has a chapter, indeed, called "Friends and Companions," in which he undertakes to introduce the reader to Emerson, Hawthorne, Margaret Fuller, and Channing, but it is a bare introduction. We know very little more of them at the end of the chapter than we did at the beginning. Another chapter, on "Concord and its Famous People," produces exactly the opposite effect upon the reader from what the author evidently intended: the impression, namely, that Concord is a very stupid and provincial New England village, and that its celebrities must have owed their fame rather to the prevailing dulness than to anything that would elsewhere seem like remarkable brilliancy in themselves. As a critic, Mr. Sanborn fails, because he does not succeed in giving us a clear picture of Thoreau, either as an author or as a man. He has accumulated a great deal of testimony to show that his friends liked him; but this might be inferred from the fact that they were his friends, and also that they thought him a genius and poet and a remarkable man in many ways. Moreover, this we knew before. Not a single trait of Thoreau's character, except, perhaps, his capacity for enduring suffering, is brought out with any distinctness. This must be Mr. Sanborn's fault rather than Thoreau's, for every one is agreed that he was a man of marked character, whatever that was. Mr. Sanborn attempts to vindicate Thoreau from the charge of moroseness and aversion to human society—a difficult task at best, considering what his career was, and that he himself speaks of his life at Walden as a "protest against society." According to those who knew him best, wild animals were at all times more at home with him than men or women. Emerson, no bad observer, says: "Snakes coiled round his leg, the fishes swam into his hand, and he took them out of the water; he pulled the woodchuck out of its hole by the tail, and took the foxes under his protection from the hunters. He confessed that he sometimes felt like a hound or a panther." On this score, Mr. Sanborn's vindication leaves matters very much where he found them, and does not, after all, make us feel that Thoreau, as a casual companion, would have been at all an agreeable or sociable person to meet. A vindication which does not vindicate could hardly be of much use as a eulogy. Mr. Sanborn, in his desire to be fair, fails to inspire us with any enthusiasm for his subject. Surely it is unnecessary, in giving an account of his personal appearance, to say that it was a "common mistake" to take him at first sight for a peddler. This may have done something to make him seem more human in a New England village, but in the world of letters it is hardly of sufficient importance to excuse its introduction. But the truth is, that at bottom Mr. Sanborn himself thinks a little better of a genius for being as commonplace in appearance as possible. It makes him more Yankee, more true to New England village life. He accordingly quotes, with great enjoyment, the following description given by a friend: "The most expressive feature of his face was his eye, blue in color, and full of the greatest humanity and intelligence. His head was of medium size, the same as that of Emerson, and he wore a number-seven hat." The art of eulogy lies in knowing how to magnify a man's greatness and importance without seeming to do it; but the extreme of commonplace is as bad as that of exaggeration.

Mr. Sanborn makes an attempt in one of his chapters to analyze the causes and meaning of the Transcendental movement. This is really the most important branch of his subject; for, whatever else Thoreau was, he was a Transcendentalist. It is very necessary for any one who undertakes to explain Transcendentalism to the reader of the present day that he should appreciate much more fully than Mr Sanborn appears to do the difficulties the subject presents. Everybody is perfectly willing to believe that the Transcendentalists exerted a great and good influence upon their contemporaries; that they recalled a sordid and material generation to a recollection of the supreme importance of the things not of this world. But what any one who looks into the subject finds it difficult to believe is that their talk about the "Superhumanities" and "Stellar duties" was founded on any philosophical system, or grew out of any intellectual opinions really deserving the name. To the worldly-minded the movement was always rather a subject for merriment; but now that we are all willing to take it seriously, what is needed is that it should be made, if possible, more intelligible. Was it an intellectual revolt against Convention and Form, connected and allied with the great modern revolutionary movement in politics? Was it an accidental local fruit of German philosophy? Was it a sort of New England Christian Platonism? Mr. Sanborn does not throw any light on these points, except to suggest that at the bottom of it was "a certain inward tendency of high Calvinism and its counterpart Quakerism, always welling forth in the American colonies." He undertakes to show, by a few extracts from their writings, how such Calvinists and Quakers as Wheelwright, Sir Harry Vane, Anne Hutchinson, William Penn, and Jonathan Edwards "prefigured the mystical part of Concord philosophy." It is surely an instance of the sarcasm of destiny that Jonathan Edwards should be held in any way accountable for a movement which was a rebellion against everything he had taught, and the promoters of which in his day he would have had great satisfaction in driving out of Massachusetts. It is only on the principle that extremes meet that we can trace any connection between Emerson and Edwards. Mr. Sanborn's extracts only prove that in New England Christianity there was always a recognition of the existence of a principle of faith transcending human experience and knowledge. It is a good deal easier, to be sure, to show that this was true of the Quakers than the Calvinists. In the case of Edwards, the evidence produced by Mr. Sanborn is more than suspicious, for it consists of a description by him, when a boy of twenty, of the charms and attractions of a young lady to whom he was very much attached, and who seemed to him to have an interior beauty of character and mind quite transcending anything he had ever dreamed or imagined. John Woolman, as a Transcendentalist, does better:

"There is a principle, which is pure, placed in the human mind which, in different places and ages, hath had different names; it is, however, pure, and proceeds from God. It is deep and inward, confined to no forms of religion, nor excluded from any, when the heart stands in perfect sincerity. In whomsoever this takes root and grows, they become brethren. That state in which every motion from the selfish spirit yieldeth to pure love, I may acknowledge with gratitude to the Father of Mercies, is often opened before me as a pearl to seek after."

Belief in some such spiritual principle as this is, however, hardly separable from the idea of Christianity; and if all the sects which have recognized it could be considered in so far Transcendental, there would be hardly any need to try to account for Transcendentalism at all.

Mankind seems to be gradually settling down to the conclusion that the sum and substance of the Transcendentalist philosophy was that its votaries looked at the world essentially as poets. How valuable their verses may be as poetry is another question, which it is as yet perhaps too early to decide. Mr. Sanborn has a high opinion of Thoreau's poetical performances, but the specimens he gives are all more or less open to the charge of a want of originality. Mr. Sanborn quotes his lines on "Smoke":

> "Light-winged smoke, Icarian bird!
> Melting thy pinions in thy upward flight,
> Lark without song, and messenger of dawn,
>
> Go thou, my incense, upward from this hearth,
> And ask the Gods to pardon this clear flame,"

and naïvely asks, "What Greek would not be proud to claim this fragment as his own?" All the early specimens of his writing, both prose and poetical, given by Mr. Sanborn, are imitative; and in prose he seems to have followed the footsteps of Carlyle in adopting, in mature life, a manner of writing which has little or no relation to his early style. But, imitative or original, he was, like the rest of his school, an idealist; and in the last resort we believe it will be found that it was their idealism, their antagonism to the material, which in a material age and country gave the Transcendentalists their importance. They came to recall New England, and through New England the rest of the country, sunk in a sordid self satisfaction produced by its material prosperity, to the fact that there is something higher and better than money and money-getting, or the contented formalism of an outworn creed; that the pursuit of truth and beauty was all that really made man's life better than that of the beasts of the field. This was what the Transcendentalists taught and practised. They put aside worldly ambition and desire as truly as ever did any mediæval monk or Oriental ascetic, and thus gave, what was essential in their surroundings, a practical proof of their sincerity. The result was almost startling. Their Yankee audience at first ridiculed them as dreamers; but when they found that what the Transcendentalists actually recommended to them was dreaming, their ridicule changed to wonder, and finally to a sort of awe-struck admiration, something like that which we may imagine a Roman to have felt on learning that a Christian was capable of giving up his fishponds and nightingales'-tongues and his afternoons at the amphitheatre for the sake of what he called the "Truth," proclaimed by an obscure Jew. Yankee worldliness was of course different from the worldliness of the ancient world, and the Transcendental gospel was not a new religion, but the New England apostles of the ideal, like Thoreau, impressed the imagination of their contemporaries as, in a different day

and generation, the heralds of a new gospel might. Their message was the battle-cry of a spiritual warfare for whatever was true and lovely and of good report, against the sordid subservience to material convenience and utility which the intellect is always basely suggesting to the conscience and heart. The effect and value of a battle-cry cannot be measured by intellectual tests.

THE KANT REVIVAL.

Kant's Critique of Pure Reason. By G. S. Morris, Ph.D. Chicago: S. C. Griggs & Co. 1882.

Kant. By William Wallace. Philadelphia: J. B. Lippincott & Co. 1882.

THESE two books, like so many others, probably owe their existence to the recent centenary of Kant's leading work. Mr. Morris's treatise, however, is announced as the first of a proposed series of "German Philosophic Classics for English Readers and Students," based on the principal works of Leibnitz, Kant, Fichte, Schelling, and Hegel. Referring to the watchword, "Back to Kant," which is now heard throughout Germany, Mr. Morris, in his introductory chapter, expresses his conviction that an important result of this movement will be "a return to those successors of Kant in whom his thought is completed"—meaning by this the metaphysicians just named. This conviction seems to us as unfounded as it is odd and paradoxical. The return to Kant is the result partly of the influence of Schopenhauer, who destroyed the nimbus that hovered around the names of Fichte, Schelling, and "the plump and stupid Hegel"; and partly of the fact that the German philosophers of the present day, being chiefly occupied with definite problems of scientific psychology, find Kant's critical method much more useful and suggestive than the ultra-dogmatism of his successors. Kant was not originally a metaphysician, but only entered this field after an apprenticeship of many years in physical and mathematical science; and as the same is true of most contemporary German philosophers—Fechner, Helmholtz, Wundt, Lotze, etc.—the secret affinity is explained which draws the latter toward Kant. Fichte, Schelling, and Hegel, on the contrary, entered philosophy from the theological arena, and thence reintroduced, in a new but aggravated form, many of those principles of dogmatism which Kant had so vigorously combated. Kant himself would have haughtily resented the imputation that these metaphysicians "completed his thought." Fichte's system he distinctly repudiated in 1799, and begged to be "preserved from such friends"; and as for Hegel's patronizing air of superiority, Kant would doubtless have heartily enjoyed Schopenhauer's caustic tirades. The Germans having almost completely abandoned the post-Kantian sophists, one cannot but regret every attempt to rehabilitate them in this country. There are, of course, numerous grains of gold scattered through these gloomy mountains of metaphysical ore, but it is hardly worth while to pick them out. The same amount of time and labor spent on psychological, biological, anthropological, and psychopathological works will give a student a hundred times as much insight into the problems of life and thought; and for the purpose of examinations the short summaries in the best histories of philosophy are amply sufficient.

Mr. Morris's introductory chapter of forty-three pages illustrates some of the demoralizing effects of a study of post-Kantian metaphysics We lack the space to examine such peculiar assertions as this, that agnosticism is practical materialism, or that spiritual forces are the only ones we can conceive of without self-contradiction; but the assertion that "Being is doing" can be corrected in a few sentences. "Being" is simply a wide, attenuated notion from which all positive attributes except mere existence have been abstracted; to add to this the pregnant quality of action, and to say that the concept is still the same, is extremely illogical. Experience certainly shows us no such thing; and in a treatise on a volume which, like Kant's 'Critique of Pure Reason,' aims at the destruction of such arbitrary, *ipse-dixit* methods of philosophizing, and at showing the impossibility of a science of metaphysics, or of knowledge going beyond experience, it is discouraging to meet with such assertions. To a reader who will be on his guard in this respect Mr. Morris's book will nevertheless be of use in facilitating the study of Kant. The philosopher's reasoning is reproduced in clear language, chapter by chapter, and the criticisms appended are often incisive and instructive. A book like this, or Kuno Fischer's analysis of Kant's works, is almost indispensable to the average student of Kant, with whom it is a common experience to encounter pages which at first convey hardly any meaning, but which, after being perused in the language of a lucid expositor who is familiar with the whole system, at once become so clear that the reader wonders he did not see the point before. But these aids should never be read except in direct connection with the work on which they are based, so that the student may be able to judge for himself of the correctness of the interpretation of such passages as are rendered obscure by Kant's horrid terminology and his frequently inconsistent use of it.

Mr. Wallace's 'Kant' is intended less for the student than for the general reader. It endeavors to give, in a little more than two hundred pages, a summary of the leading facts of Kant's life, and the leading ideas of his works, avoiding Kantian terminology as far as possible. It need hardly be said that the biographical part is better done than the philosophical, for Kant's ideas do not easily admit of being squeezed into a nutshell, while on the other hand a good biography is sure to be entertaining, because Kant's life, uneventful as it was, was flavored by the oddity and regularity of his habits. Those who can readily follow all the chapters in this book will find no insuperable difficulty in understanding the much more complete chapter on Kant in Ueberweg's 'History of Philosophy,' but it does not follow from this that Mr. Wallace's book is not well worth reading. Most of it is expository, criticism being only occasionally introduced. A reference to Prof. Zeller's recent able criticism of Kant's ethical views would have made the chapter on these more suggestive and valuable; and in the chapter on Kant's æsthetic doctrines a few pages on the manner in which they have been adapted and modified by Schopenhauer would have reflected light on Kant himself. Kant's ideas on the beautiful and sublime have had an immense influence on modern æsthetic speculation; and imperfect as they often are, they are yet to a modern student extremely instructive, since they resemble Darwin's discussions in clearly pointing out the various problems involved, whether they are solved or not. The power of profound meditation has never been more beautifully illustrated than in this case; for Kant, as is well known, had very little direct knowledge of art, music, or even poetry. He was at one time offered a professorship of poetry, but declined it, as he probably felt that his greatest powers were not in that direction.

We must, however, defend Kant against an unjust criticism of Mr. Wallace's, who quotes as evidence of his limitations on the æsthetic side his statement that "the old songs from Homer to Ossian, and from Orpheus to the prophets, owe their brilliancy of style to the want of proper means to express their ideas." This is in reality one of the most brilliant aperçus ever made by Kant. What he means is, that the directness and pictorial concreteness of the language of the old poets are due to the fact that they reasoned not in abstract ideas, but in images. Modern poets of the highest rank do the same thing, but they do it consciously, while with the ancients it was unconscious and involuntary, owing to the fact, well known to all students of anthropology, that abstract ideas and dexterity in the use of them have only been very gradually developed in course of time. The language of savages is always more poetic or pictorial than that of civilized beings, excepting (for here, too, extremes meet) men of genius. According to Schopenhauer, all original thinking is done in images, and there can be little doubt that Kant was one of those who reasoned in this way. This seems to be disproved by the abstractness of his language in his principal works and his avoidance of illustrations; but the cause of this evidently was that Kant had inherited or imbibed the notion that illustrations are out of place in strictly scientific treatises. Those which he does introduce are always extremely apt and appropriate, while his popular treatise on psychology, which he called 'Anthropologie,' is so full of references to men and things that it reads more like Schopenhauer than like Kant, showing that whenever he thought fit he could readily give a profusion of those concrete images on which his abstract reasoning was based. His immediate successors, on the contrary, began with the dryest and most barren generalizations, and endeavored to deduce from them the world of men and things, as far as those dignitaries considered it worth while to condescend to such trifles.

THE MAGYARS.

Die Ungern oder Magyaren. By Paul Hunfalvy. Vienna and Teschen. 1881.

PAUL HUNFALVY'S ethnological and philological writings have placed him at the head of the critical school which began with the linguistic explorations of the traveller Reguly in the Ural regions, nearly forty years ago, and whose decision as to the origins of the Magyar nation has been generally accepted as conclusive. That the Hungarian language is kindred to the Finnish, and more closely related to it than to the tongue of any well-known people of Europe or Asia, had been discovered and proved generations before Reguly, but the links connecting the idioms of Finland and of the tribes that crossed the Carpathians under Álmos and Árpád, a thousand years ago, after long migrations from the Volga, were not sufficiently known before the investigations of that traveller, and the Finns could be considered an ethnic branch violently detached and carried away from a remote eastern home, and thus valueless for the discovery of the soil on which the common stem had grown up. Even as late as the third decade of this century, Csoma de Körös (Körösi Csoma, as the Magyars say), morally and intellectually one of the noblest sons of Hungary, spent years in the valleys and Buddhist mountain monasteries on the Himalayan confines of Thibet and India, following up deceptive philological traces in search of the cradle of "Árpád's nation." These romantic speculations have now been abandoned by Magyar scholars, as the formerly current identification of Hungarians and Huns has been, in spite of the popularity which Attila continues to enjoy in Hungarian ballads; and the most prosaic of all solutions of the vexed problem about the descent of the chivalrous nation is submitted to by the learned public at

Buda-Pesth almost without a protest. The people that boast of such names as Hunniades, Bethlen, Rákóczy, Kossuth, Petöfi, and Deák acknowledges as its nearest ethnic kindred the Voguls, who resemble the Calmucks; the Ugrians and Ostyaks, neighbors of the Samoyeds; the Siryans, Tcheremisses, Votyaks, Mordvins, and other barbarous tribes in the wilds of Russia, on both sides of the Ural Mountains. And what Paul Hunfalvy and Joseph Budenz have established at their centre of learning, Donner and his colleagues at the Finnish university of Helsingfors accept as no longer contestable.

The book before us, forming the fifth part of the interesting collection entitled 'Die Völker Oesterreich-Ungarns, ethnographische und culturhistorische Schilderungen,' was, unlike the author's larger 'Ethnography of Hungary,' written originally in German. It gives a succinct account of the results in this field of critical research, together with observations on the migrations of his nation toward its present land; on the various elements which successively entered into the formation of its nationality and language as now constituted; on its gradual religious, political, and literary development, and similar topics. The remarks concerning the very origins of the people contain what is comparatively most new. The Finno-Ugric family of the Uralo-Altaic, or Turanian, division of mankind had its abode, at a very remote period, in the basins of the Dvina, Kama, Volga, Ural, Irtysh, and Ob rivers, between Teutonic and Slavic tribes on the west and Turkic tribes on the east. The north was open to it to the Polar Sea; on the south, peoples of various races migrated past in a westerly direction. The Ugric branch of the family, to which the Magyars, Voguls, Siryans, and others belong, occupied lands between the Irtysh and Ob, in Western Siberia. Many of the commonest words of the Finno-Ugric languages testify to close relationship. Thus—to cite some of the most striking examples—the respective words in Magyar, Vogul, and Finnish for eye are: *szem, sem, silm;* for mouth, *száj* (pron. *sāy*), *sop, suu;* for throat: *tor-ok, tur, tur-kku;* for hand: *kéz, kat, kät;* for blood: *vér, ver, vir;* for heart: *szív, sim, syöm;* for name: *név, nim, nime;* for water: *víz, vit, vete;* for stone: *kő* (*köv*), *kav, kive;* for winter: *tél, tal, talve;* for ice: *jég, yang, jää;* for goose: *lúd, lunt, lintu;* for fish: *hal, kul, kala;* for woman: *nő, ne, nai;* for master: *úr, yor, uroh;* for one: *egy* (pron. *edy*, in one syllable), *äk* (*äkve*), *yhte;* for two: *két* (*kettö*), *kit* (*kiti*), *kahte;* for three: *harm, korm, kolme;* for four: *négy* (pron. *nědy*, in one syllable), *nelyä, n'ilä;* for five: *öt, ät, viite;* for six: *hat, kat, kuute;* for seven: *hét, sat, seitse.* The words for eight, nine, and ten differ widely—ten, for instance, being *tíz* in Magyar, *lau* in Vogul, and *kymmen* in Finnish. The words for eight and nine are compounds, almost evidently signifying *ten less two* and *ten less one.* These circumstances prove that the Finno-Ugric peoples originally counted only up to seven, as did the Turks, Basques, and others.

In this first period of their growth the Finno-Ugric peoples lived by hunting and fishing, as their common terms for things belonging to these occupations show. A considerable social advance is proved by their common words for father-in-law, son-in-law, bride, village, town, spinning, weaving, knitting, etc. There is, however, no trace of horned cattle in their common vocabulary—not even of the reindeer, the taming of which the Finns and Lapps learned later from the Scandinavians. Their oldest domestic animals were the dog and horse. After the separation of the Finnic and Ugric tribes, the former came under the influence of Teutonic neighbors, and the latter of Turkic. The Magyars, having left the common abodes of the race, learned from Turkic tribes adjoining them on the south the art of husbandry and the names of the ox (Magy. *ökör*, Osm. *öküz*), buck (*kos, kotch*), ram (*ürü* in both languages), hog (*disznó, donyuz*), hen (*tyúk, tauk*), apple (*alma*), barley (*árpa, arpa*), pea (*borsó, burtchak*), hemp (*kender, kendir*), hatchet (*balta*), kettle (*kazán, kazan*), gate (*kapu, kapi*), market (*vásár, bazar*), and other familiar objects, besides the names of the lion (*oroszlán, arslan*), camel (*teve, deve*), and other strange animals. Our author considers the Khazars as the nation from which the Magyars most probably borrowed the Turkic elements of their language, relying on the authority of Constantine Porphyrogenitus. According to this imperial writer, the Hungagarians (whom he calls Turks, once also Mazars) were friends and allies of the Khazars, and their wayvode Lebedias married a daughter of the Khazar Khan, shortly before the election of Árpád. A branch of the Khazars, the Kabars or Kavars, having been defeated in a civil war, fled to the Hungarians, and, pitching their tents among them, taught them the language of their race. On philological grounds, Hunfalvy believes the Tchuvashes, living on and near the middle Volga, to be the descendants of the once so mighty Khazar nation.

The name *Magyar* Hunfalvy derives from *ma*, or *mo*, which in Vogul signifies *country* (Finn. *maa*), and *gyer*, man, discoverable in the Hungarian diminutive *gyerek, gyermek*, little man, child, and corresponding to the Vogul *kär, kärem*, man. Thus the Moger or Magor of the early Hungarian chroniclers, now Magyar, signifies countryman, a term by which the Hungarians distinguished themselves from all foreigners. Magoria is to the chroniclers a part of Scythia, bordering on the country of the Jorians on the east. This is the territory of the Voguls and Ostyaks, in the West-Siberian Government of Tobolsk, known in the Middle Ages as Jugoria, the land of the Ugors, or Ogors. From the name of this people is derived the name Ungri, which the Byzantines, about 1000, applied to the latest conquerors of Pannonia, whom they also designated as Turks, Huns, and Mazars, and from *Ungri* spring the modern *Ungern*, or *Ungarn, Hongrois, Hungarians.* Ibn Bastah, an Arabic author who wrote in the beginning of the tenth century, calls the Magyars by their own name, modified into *Madjars.* His description of them, however, which places them north of the Black Sea, refers to a period preceding the conquest of their present land, achieved at the close of the ninth century. According to Leo Grammaticus, some Hungarian hosts appeared on the lower Danube fifty or sixty years before that conquest. Constantine Porphyrogenitus, speaking vaguely as to time, finds the Magyars established in Lebedia, which, according to his description, must have been west of the Volga and of the eastern Bulgarians, who dwelt on both sides of that river. Further east, between the Volga and the Ural river, lived the Petchenegs, and near them the Uzes, or Cumans; and south of the Bulgarians the Khazars, from the Don to the Caspian. The Khazars and Uzes, united, drove the Petchenegs from their land; the latter invaded Lebedia, and forced the bulk of the Magyars to migrate westward toward the Pruth and Sereth, rivers of Moldavia, whence they marched, across the Carpathians, into the basin of the Danube and Theiss. A part of the Magyars, however, moved eastward "toward Persia"—says Constantine—that is, beyond the Volga, where missionaries from Hungary still found a Magyar people in the earlier half of the thirteenth century, shortly before the great invasion of the Mongols. This invasion obliterated what was then called Magna Hungaria.

Atlanta. By Jacob D. Cox, LL.D., late Major-General commanding Twenty-third Army Corps, U. S. A. [Campaigns of the Civil War.—IX.] Chas. Scribner's Sons.

General Cox has given us a clear and straightforward account of the memorable campaign of Sherman against Atlanta, which terminated in the capture of that city and opened the way for his subsequent "march to the sea." The author, himself a distinguished participant in the movements he describes, shows great familiarity with all the details of the campaign, and a minute comprehension of the varied topography of the field of operations. His narrative is careful and painstaking, and his style lucid, though he is likely to become wearisome to other than professional readers, from the particularity with which he describes the positions and movements of the troops. The advantage of this particularity, even to the student of military history, is partially neutralized by the very indifferent maps which accompany the text, and which are, in this, as in some other volumes of this series, unworthy of the books they are intended to illustrate.

In the spring of 1864 the contending armies in Georgia were about to enter upon a death struggle. During the winter the Confederate Government and General Johnston had used every effort to repair the losses of the preceding campaign, and to set on foot a force which could make headway against the Federal armies, now combined under General Sherman and threatening the conquest of Georgia and Alabama. By the first of May some 65,000 or 70,000 men had been collected by the Confederates, of which 50,000 were with Johnston at Dalton, and the remainder were gathering to his assistance. Against this force Sherman was about to advance with 100,000 men, and Blair was coming up with 9,000 more. General Cox, in discussing the strength and losses of his opponents, lays too much stress on the imperfect field returns of the Confederates as compared with the fuller and more accurate reports of the Union officers. The poverty that sometimes placed a bottle of ink and a sheet of paper out of the reach of a returning officer had its effect, no doubt, but not to the extent, nor with the results, imagined by General Cox. The returns, when made, show for themselves, and to add "twenty per cent." to them, to put them on the basis of the Northern reports, is, to say the least, a very questionable proceeding in an historian. General Cox sweepingly avers of the Confederates, "that from a very early period of the war a systematic habit was formed of underestimating their own numbers and their own losses by way of exaggerating the odds at which they were fighting, and of keeping up the popular illusion that the preponderance of strength in the North was made up by superior military qualities in the South." But human nature was much the same on both sides, temptations to exaggerate were not wanting on the part of the North, and we shall never get at the facts in any given case by assuming habitual misrepresentation.

Sherman's campaign was a masterly one. He had, it is true, more than three men for every two opposed to him, and his preponderance in equipment was still greater; but he was far advanced in a hostile territory; he was compelled to maintain and defend a long line of railroad, his only avenue for supplies; he had before him a veteran and vigilant foe in a mountainous country, affording great facilities to its defenders and presenting corresponding difficulties to an invader. He first advanced against his enemy at Dalton, and finding him too strongly posted

to be driven, dislodged him by a well-executed movement by the right flank, through Snake Creek Gap toward Resaca. He quickly followed this up by another movement of the same flank, which compelled Johnston to fall back over the Oostanaula, nor was the latter able to make a stand until he had retreated south of the Etowah to the vicinity of Dallas and New Hope Church. In two weeks the Federal commander thus forced his adversary back for fifty miles, without a general engagement and without suffering heavy loss. Sherman now attacked the Confederates in position at New Hope Church and Pickett's Mill, on May 25 and 27, but was repulsed on both days with severe loss. His large superiority, however, soon enabled him by a movement—this time of his left flank—to force Johnston back, first to Lost Mountain, and then to Kennesaw. Impatient of the tenacity with which Johnston here held him in check, Sherman again tried, on June 27, a general assault of the Confederate lines, but everywhere met with a bloody repulse, and for the future desisted from such assaults upon entrenched positions. Recurring once more to his flanking operations, he pushed forward his right flank toward the Chattahoochee, while he held Johnston with his main body. The Confederates, to protect their communications, again fell back, and on July 9 finally crossed the Chattahoochee.

Important events now followed in rapid succession. Sherman passed the Chattahoochee with little opposition, while Johnston prepared to dispute the further advance of the Federal army, by taking a position on Peach Tree Creek, in front of Atlanta. On July 18 he was removed from command, the Confederate Government being greatly dissatisfied with his continued retreat, and fearing that his defensive tactics would result in the speedy fall of that city. Hood was put in his place. This officer, more dashing than discreet, at once exchanged a policy of cautious defence for one of offence, and on July 20 and 22 made vigorous efforts to overthrow first the right and then the left wing of the Federal army. These attacks, though inflicting severe damage on Sherman, were more exhausting to the Confederates. They (in conjunction with the successful operations of the Confederate cavalry) merely postponed the fall of Atlanta for a few weeks, until Sherman could gradually extend his right completely around the city, and place it firmly on the Macon Railroad in the rear. Hood, no longer able to keep his communications open, was forced to evacuate on September 1.

General Johnston's course during this campaign, as well as that of the Confederate Government in removing him from command, has been the subject of much diverse and bitter criticism. We have space but for a few words on the subject. That General Johnston had ability of a very high order for conducting the defensive operations of a small force against one so overwhelming as to preclude aggression, seems to be beyond question, as witness his skilful retreat from Manassas in 1862, and his still more masterly defence of, and retreat from, Yorktown; but his predominant characteristic as a commander was caution, and he was not so well fitted to command when disparity of numbers and resources were to be neutralized by boldness of design, rapidity of movement, and fierceness of attack. Many a commander, inferior to General Johnston in intellectual calibre, has won renown by holding, with smaller resources, such a country as North Georgia against an invading host. Nor can the attitude assumed by General Johnston in his correspondence with the Confederate President and Secretary of War be thought worthy of his position and fame. The action of President Davis, however, in displacing him at the very crisis of the campaign was a tremendous blunder. Rare and extreme circumstances can alone justify a change of commanders in the midst of active operations. In this case the result was a series of events that rapidly precipitated the downfall of the Confederacy.

General Cox's account of the cavalry operations of this campaign is inadequate. The minor errors of the book are few. A curious one occurs on page 98, where General Polk is spoken of as Bishop of Tennessee and brother of President Polk.

Facsimiles of Examples in Delineation, Selected from the Masters for the use of Students in Drawing. By Charles H. Moore, Instructor in Drawing and Principles of Design in Harvard University. Cambridge: Moses King.

"HITHERTO, as a rule," says Mr. Moore, "examples of more or less inferior kind have been the only ones within reach of those who have wished to learn to draw; and the loose and meaningless habits of execution, and the uncultivated taste, which are so frequently met with, are but the natural result of their use. But now that the mechanical methods of reproduction have reached so high a degree of perfection, there is no longer any reason why students of drawing should not be supplied with the very best models."

To train the eye and the hand, and at the same time to lay the foundation of a pure and elevated taste, is, then, the object of this collection of designs. All who have had experience must agree with Mr. Moore that confusion of purpose, infelicity of selection, and mediocrity of invention, have presided heretofore over the manufacture of drawing-books and cartoons, and the teaching which has been based upon them. To confront the pupil, on the other hand, with masterpieces which ennoble even the failure to imitate them; to choose them with a sure sense of the peculiar discipline of each; to arrange them according to their progressive utility and their mode of production or reproduction—this is a service long needed and now executed by Mr. Moore with characteristic insight and refinement. He is himself familiar by actual practice with numerous vehicles of design; he has served his apprenticeship in copying the old masters; his own work is highly prized by lovers of art; and he has a perfectly clear conception of the task he has undertaken.

The sixteen plates of facsimiles made by the Forbes Albertype process vary in interest, and do not equally betray at a glance the special instruction intended. Parenthetically, we should observe here that they are not to be given to beginners, but to those who have already attained a precise command of simple lines. The first is Holbein's pen-sketch of Sir Thomas More's family, and until attempted it will probably seem the easiest of the series. In fact, the pupil who passes from it *cum laude* will be prepared to attack anything that comes after. More figures are introduced, for the sake of a like firmness and expressiveness of line, in bits from Dürer's woodcut designs from the Apocalypse and the "Great Passion." A woodcut after Titian, vouched for by Mr. Moore as in character of line remarkably like Titian's own pen-drawing, is followed by a portrait of a Doge, etched by Tintoret. Two red-chalk drawings from nature, of berry-vines, by Leonardo da Vinci, exhibit and will exact qualities of the highest draughtsmanship. In five etchings from Turner's 'Liber Studiorum,' rocks (as in "Dunstanborough Castle"), the strand (as in the "Smugglers—Flint Castle"), the pool (as in "Near Blair Athol"), tree forms (as in the last-mentioned plate and in the "Cephalus and Procris"), and the sweep of mountain, gorge, and valley (as in the astonishing suggestions of "Ben Arthur"), are all held up for imitation or despair. One sample of Prout's architectural drawing invites the crayon or the lithographic pencil; a softer chalk is required for Ruskin's Venetian stilted archivolt and arch from San Michele at Lucca; while John Lewis's etchings of horse, donkey, and sleeping lion and lioness can hardly be followed except with the needle, unless the pupil prefers the option, held out for all the plates by Mr. Moore, of endeavoring to render their "characteristics in a comparatively free manner, as one might from nature." In the case of the smaller Lewises, at least, a slavish adherence to the lines we should regard as worth little except as a lesson in the technic of etching. The lion's mane is a different exercise, and as profitable, maybe, as the Doge's beard.

These plates are tastefully issued in a portfolio, and accompanied with handsome, though not very extended, letter-press. They will educate those who do no more than study them carefully without a pencil. The plan is so sound, and Mr. Moore so competent a guide, that we wish he might do something to raise the standard of primary instruction in drawing, which is lamentably deficient wherever it has fallen under our observation, in schools public and private.

The Culture and Management of our Native Forests. By H. W. S. Cleveland. Chicago, 67 Washington Street. Pp. 16.

THIS is a paper read last winter before a committee of the Massachusetts Legislature, and its object is to show that our natural forests may be greatly improved in value and beauty by a little judicious care and management. American writers on forestry, looking rather to the wants of the treeless West than to the requirements of the Eastern part of the country, have heretofore generally confined their attention to explaining the necessity and methods of planting trees, and little has been said of the importance of caring for the forests which nature spreads with such lavish hands over all the Atlantic margin. In any of the Eastern States, except, indeed, along the immediate sea-coast, trees will spring up with astonishing rapidity, if the ground can be protected from fire and the attacks of browsing animals; and it is to these self-planted woods that we shall have to look mainly in the future for our supplies of lumber. Forests, no doubt, and very extensive ones, will in time be planted on the Western prairies; but nature plants better and cheaper than man, and a planted forest can hardly compete as a money investment with a self-sown one.

The growth of a forest is one long struggle between the individuals composing it for mastery in the race for life. In the long run, the strongest species or individuals conquer and crowd out the weaker; but this process of natural selection is very slow, and a great deal of energy is consumed in it. In other words, in every natural forest in a well-watered country there are ten times as many trees as can possibly reach maturity, and the destruction of the superfluous trees by their stronger or more fortunate neighbors is only obtained at the cost to the survivors of rapid growth and early maturity. But nature can be greatly aided in its selection of the individuals to reach maturity; and here forestry should step in, and thin our woods and prune and direct the growth of our most valuable trees. Such methods are well understood in Europe, where timber commands prices which justify the cost of the labor necessary to assist nature to produce the finest possible trees in the shortest time; but in this country the value of forest products has not yet warranted the expense which a scientific management would impose on landowners. The time, however, cannot

be distant when it will be as profitable for the farmer to thin and prune his trees as it now is to manure and cultivate his corn or potatoes; and instruction in the methods of woodland management, based on experience and the study of the laws of nature, is certainly one of the most urgent needs of American agriculture. Mr. Cleveland's pamphlet is suggestive, and prepares the way for a more detailed work on the same subject.

The Finances and Public Works of India, from 1869 *to* 1881. By Sir John Strachey, G.C.S.I., and Lieut.-General Richard Strachey. London. 1882.

THIS is the joint work of two brothers. Sir John Strachey was for many years at the head of the finances of India, and his term of office is chiefly remarkable for an enormous blunder which marked the close of it. At a time when the expenses of the war in Afghanistan averaged £750,000 a month, Sir John calculated in his budget that the expenses for the year would amount to £1,000,000, adding that he saw "no reason to suppose that the estimate erred on the side of being too low." General Strachey was for many years at the head of the Public Works Department in India, and, as in the case of his brother, his term of office was signalized by an enormous blunder, for which the Indian taxpayer has had to pay very heavily. The great strategical railway which is to unite Calcutta with Peshawur had been constructed as far as Lahore on the broad-gauge system. At this point General Strachey, in defiance of the unanimous opinion of the railway experts, insisted upon carrying it on upon a narrow gauge. The consequence was that the extension, having been completed at great cost, was found to work so badly that the narrow-gauge railway had to be destroyed, and the whole reconstructed on a broad gauge. These two eminent administrators now come forward to assure the British nation that under their wise management of the finances and public works of India the people of that country have been redeemed from a condition of poverty to one of almost unparalleled affluence.

Nobody can read this book and doubt the perfect sincerity of its authors. Their panacea for the ills of India is a very simple one, and they are entirely convinced of its efficiency: it is to borrow enormous sums of money and construct therewith canals and railways all over India. They claim to have restored India to a state of affluence because they have carried out this policy to a large extent, though not to that enormous extent which a far-reaching wisdom would have enjoined. At the same time, from the midst of a huge and bewildering chaos of figures, these broad facts are clearly to be recognized: During eleven years of peace, the ordinary debt of India has been increased by £60,000,000—from £97,000,000 to £157,000,000; £142,000,000 have been expended on canals and irrigation-works which are called "productive," but which as yet have not returned enough to pay the costs of their annual maintenance; £15,000,000 have had to be expended in famine relief, notwithstanding which 8,000,000 of the people of India have succumbed to hunger; £18,000,000 have been spent on the futile war in Afghanistan; and the excess of exports from India over imports, during the same time, has exceeded the gigantic sum of £120,000,000. There are people, Sir John Strachey admits, who, fixing their attention upon these facts, are loth to admit the marvels which he and his brother profess to have achieved. They declare that the people of India "are becoming poorer and poorer, more and more exposed to ruin and death by famine; that crushing taxation goes on constantly increasing; that an enormous and ruinous tribute is exacted from India to be spent in England; and I know not what else. I have," adds Sir John Strachey, "neither the time nor the inclination to reply to statements of this sort." Sir J. Strachey, however, has not adhered to this intention: the present book, which contains 450 pages, is a very labored, and quite ineffectual, answer to "statements of this sort." For neither he nor his brother perceives the very obvious fact that, while a large extension of public works is a legitimate index to a nation's prosperity when they are freely constructed out of the surplus capital of the nation itself, they denote nothing of the kind when constructed by a foreign despotism by means of imported capital. On the contrary, works constructed in this manner, while at the best they can benefit a portion only of the community, represent additional taxation imposed upon the community as a whole.

We will illustrate our meaning by the case of the East Indian Railway—one of the "guaranteed" railways, as they have been called. By its contract with the East Indian Railway Company, the Government of India provided, free of charge to the company, all the land on which the railway is laid, and guaranteed from the revenues of India five per cent. interest on the capital of the company, payable in sterling in London. The net cost to the state—*i. e.*, to the people of India—is estimated to have amounted to not less than £12,000,000, when, by the terms of the contract, the Government of India was compelled to buy the railway outright. The price paid was £125 for every £100 of capital stock, or £32,750,000 for the whole stock of £26,200,000. Now, whence did the Government of India obtain all this money? They deducted it from the scanty subsistence of the ryots all over India, nineteen-twentieths of whom no more benefited by the construction of this railway than if it had been built in the moon. Whatever profits may accrue in the future to the state from the working of this railway, the wealth of the present generation has been destroyed to that extent by the fact of its construction. No compensation can ever be made to them, and they will bequeath by so much a scantier patrimony to the generation which succeeds them. It is freely admitted upon all sides that there is no capital available in India for the construction of these huge and costly railway-lines. The people live from hand to mouth, and possess nothing which is not required for the needs of the day. Capital must, therefore, be imported, and the interest on all such capital has to be paid by the very people who, in order to pay it, must deduct the amount from their already scanty subsistence. Thus the primary effect of the state undertaking to construct canals and railways in India is to intensify the prevailing impoverishment of the people. And when such undertakings are pushed on to excess by administrators of the Strachey type, the first failure of the harvest discloses the frightful abyss to which the people have been drawn. Stripped by the demands of the Government of all their little savings, dependent in each year for what they can obtain from the soil during that year, if the harvest be blighted before it is gathered, they have no alternative but to lie down and die.

An Etymology of Greek and Latin. By S. C. Halsey. Boston: Ginn & Heath. 1882.

THOSE who are watching the tendency of methods of classical instruction will be interested in this, the second of Messrs. Ginn & Heath's publications for the use of young students in classical philology (the first having been Prof. F. D. Allen's 'Early Latin,' published two years ago). The subject of the new book assures it a welcome. It has evidently been made with painstaking labor, and is exceptionally free from that class of errors which is to be expected in a work that aims to put a large and difficult subject within the reach of beginners. On the other hand, its defects are of a kind much more easily avoided—namely, want of a clearly-conceived purpose, and errors of proportion. The important thing in a book of this kind is not so much to teach the student that such and such phenomena are facts, and that such and such words are related, as to give him sound and clear ways of looking at things. It is greatly to be feared that the young student of the 'Etymology' will not get very sound and clear ways of looking at phonetic change, for example, from the six and a half pages into which the whole of that large subject has been crowded. For the "rules" of assimilation and dissimilation of consonants, the learner is referred to the grammars, in most of which, in the nature of things, a treatment in keeping with a purpose like the present is not to be expected. The very word "rule," indeed, is of ill omen in a book upon comparative philology, though it is in perfect harmony with a form of statement like the following (under the head of vowel-change): "The object of dissimilation is to prevent," etc. The subjects of reduplication, nasalization, consonant-insertion, and inorganic vowels, are entirely omitted. No explanation is granted of the meaning of the phenomenon of vowel-increase, though the tables are given at some length. The subject of rhotacism is stated without explanation, illustration, or limitation of range, in the words, "Often *s* passes into *r*." On the other hand, the views of the new school are stated at much greater length. To students of some advancement, such a statement is the most important part of the book. But it is intended by the author—and very properly—that the subject he is treating shall be approached by beginners by the methods of the old school; and for that reason the young people for whom the book was made are entitled to demand, at whatever sacrifice of other things, a clear and sufficiently full presentation of the views of that school—to say nothing of the views held in common by both schools. It is to be doubted, too, whether the author has done well in ignoring the distinction expressed by the convenient terms, "cognate" and "derivative," and in giving no clew in his large enumeration of English words to any differences of experience among them.

In spite of these and similar imperfections, however, the book will be a useful one, and, improved as it doubtless will be in later editions, it should have an honorable career.

Mountain Scouting. By Edward S. Farrow, U. S. A., Assistant Instructor in Tactics at the U. S. Military Academy. New York: Metropolitan Publishing Co.

'MOUNTAIN SCOUTING' is something after the manner of Francis Galton's admirable little work on the 'Art of Travel,' but is more limited in its scope and far less carefully prepared and printed. It is designed primarily as a handbook for young officers going for the first time to the frontier, and abounds in practical suggestions with regard to camping, mule-packing, marching, Indian-fighting, cooking, living off the country, etc. Much of the information has a smack of real life about it, as, for instance, this: "To prevent a mule from braying when silence is necessary in a hostile country—tie a heavy rock to his tail." That, one feels at once, is drawn from the author's personal experience. A portion of the book is confessedly a compilation; but a great deal, such as the "diamond hitch" in mule-packing with an aparejo, has probably never been

printed before. Its value, therefore, to those who intend roughing it in the West, is considerable, but would have been greatly enhanced by a more systematic arrangement, or at least by the provision of an index. It seems singular that an instructor in tactics at West Point should be so inconsequent as to give, under the heading of "Rice pudding," instructions about fortifying one's camp; so credulous as to repeat, as a fact, the long-exploded story of old hunters, that the big-horn "frequently leap from great heights, landing on their horns"; or so innocent of zoölogy as not to know that the so-called "jack-rabbit" is not a rabbit, but a hare.

The vocabulary of the Chinook jargon, the common language of intercommunication between the many little Indian tribes of the Northwest, should have been given in Chinook-English, as well as in English-Chinook, since probably the majority of people learn a new language largely by ear. In such an uncouth dialect as this, especially, the written signs very inadequately express the sounds for which they stand. A stranger would first familiarize himself with the words he hears, and then learn their meaning. He might commit the little vocabulary at the end of this book to memory, and yet not be able to make himself understood; so that, if only one vocabulary were to be given, the Chinook-English would be the more useful of the two.

The Land of the Bey: Being Impressions of Tunis under the French. By T. Wemyss Reid. London: S. Low. 1882. 8vo. Pp. xii.–312.

Mr. Reid went to Tunis apparently as the special correspondent of the *Standard*, arriving in the city October 17, 1881, a few days after its occupation by the French. His stay in the country was very short (seventeen days in all), and he saw nothing of the military operations connected with the virtual annexation of the Regency. As a contribution to the history of this questionable transaction, therefore, his book has little or no importance. Its only value consists in the fact that it is a series of bright sketches of life and incidents in Tunis at a time of great interest. All alike, natives and foreigners, were naturally in a state of great excitement, and the latter never left their quarters without the risk of meeting an assassin in any scowling Arab who passed them. Under these circumstances, it was somewhat startling to Mr. Reid, on returning to his room at the hotel one day, to find it occupied by an English lady and her daughter, "a pretty young girl of seventeen," who had chosen this time to visit Tunis because "it was such a romantic place." In blissful ignorance of any cause for alarm, "they were quite prepared to go for a walk by themselves into the very midst of the native quarter"! Over the beauty of the bay of Tunis our author is very enthusiastic. The city itself, however, differs but little from other Eastern cities. The narrow, squalid streets, the bazaar with its tiny shops and impassive merchants, the strange parti-colored throng of passers-by, the strings of heavily-laden camels and mules, are well described, but seem perfectly familiar. There are also the same sharp contrasts between the exterior and the interior of the houses of the rich. Mr. Reid was invited by a General Ben Ayad to witness some of the native dances. Entering from "a little courtyard surrounded by buildings apparently of the utmost squalor," he found his way up a staircase, dimly lighted by a single oil-lamp, into what appeared to be a deserted house.

"Suddenly a door was thrown open, and, as if by magic, the scene changed. We saw before us a vast and brilliantly-lighted apartment, the extreme length of which could not have been less than sixty feet, nor its breadth less than forty. Brilliantly illuminated both by gas-jets and countless candles, its richly-tiled walls and gaily-painted ceiling fairly glittered with light. It was furnished with huge looking-glasses, set in swinging frames like those used by ladies in their dressing-rooms, and wardrobes and cabinets of large size. The wood-work of all these was of the most brilliant vermilion-red, lavishly picked out with gold, and the general effect of this barbaric splendor was so grand that I was filled with surprise as I found myself in this noble hall, and felt fairly dazzled by the magnificence of the scene."

At the Bey's palace he saw a curious ceremony, which very likely now has for ever ceased:

"A melancholy-looking man in tattered garments, beating a large drum—like himself, considerably the worse for wear—crossed the courtyard, and, climbing the lion staircase, took up his position in front of the door of the throne-room. He was followed by a second performer on a kind of flute, from which he drew forth weird and ear-piercing strains. The door was thrown open, and two old heralds in scarlet and gold took their places on either side of it. Then, when the musical performance, which had lasted some considerable time, had ceased, one of the heralds, a venerable Turk, proclaimed in Turkish—and apparently by a series of dismal howls which reverberated through the corridors and courtyards of the palace—the titles and glories of the Sultan."

If we are not mistaken, a very similar ceremony takes place on Friday in every mosque in Algeria, notwithstanding the strenuous efforts of the French to prevent it. A short visit to the ruins of Carthage was the only excursion at any distance from the walls which Mr. Reid dared to make. "The whole site of the city is strewn with the broken fragments of pottery, mosaic, sculptured marbles, pillars, and tiles. Everywhere, too, huge fallen masses of masonry are lying prone upon the earth." The most perfectly preserved of these ruins are the cisterns, "vast subterranean structures, with heavy, vaulted roofs." The great mounds have been partially dug over, and some valuable treasures have been found, but they have not yet "been explored with modern thoroughness." An attempt to reach the sacred city of Kairwan failed, though our author got as far as Susa. The French were evidently not anxious for the presence of an English special correspondent with the army. But they had still more objectionable visitors than he, as the following passage shows: "Tunis has lately witnessed a remarkable influx of mysterious Germans—gentlemen, for the most part, of a decidedly military bearing. . . . These gentlemen are by no means obtrusive in their demeanor. They frequent none of the hotels; they might even seem to be anxious to escape the observation of the French authorities. . . . They show a most unwearied assiduity in collecting facts, both political and military, with regard to the past and the present of French rule in Tunis." In the closing chapter Mr. Reid treats exclusively of the political situation, but not in a manner to furnish much enlightenment. Showing the extent of English interests in the country, however, he states that there are 10,000 British subjects, chiefly Maltese, resident in Tunis.

Brushland. By John Darby. Philadelphia: J. B. Lippincott & Co.

It would probably surprise the author of this book to be told that his farming is better than his English, or his fine English; but so it is. The supposititious dialogues with "my publisher" and with "Broadcloth," the classical allusion, the mystical philosophizing, are the rubbish which the judicious critic condemns as remorselessly as our amateur cultivator did the daisies and brambles of his Jersey farm. His excuse for writing is his success in redeeming a small portion of the uninviting but really fertile southern section of New Jersey; he, a Philadelphia physician, directing, and with and through his tenants executing, his schemes of drainage, repair, and scientific planting. There is undeniable romance in such a recovery of the soil from waste and ruin, and health and profit in the process. The narrative seems as truthful as it is whimsical, and the book will take its place in the rapidly-growing library of New Jersey evidences. No one who has given any attention to the subject is disposed to regard lightly any prophecy of the future wealth and productiveness of the land of the vine, the cranberry, of all fruits, of glass, and of pottery—of clay, sand, marl, the scrub-oak, and the scrub-pine; a Western flatness with the undeveloped richness of the prairie, and with more than the prairie's capacity for the growing of timber; the dismal tract lying between the two greatest markets and the largest urban populations on the continent; the cause of the most unfounded prejudices against the State on the part of travellers who, like a certain ex-Secretary of the Treasury, take the census from the car-windows.

Essays and Dialogues of Giacomo Leopardi. Translated by Charles Edwardes. With Biographical Sketch. Boston: J. R. Osgood & Co. 1882. Pp. 216.

This well-translated and tastefully-bound volume is, in view of the increasing interest in the writings of the apostles of pessimism, also opportune. Like the rest, Leopardi loved paradox, was not free from affectation, and realized the full value of his miseries as a "whetstone to his wit." There was also an adverse fortune as well as moral weakness; but the third and better element of pessimism was not lacking in him. There are abundant indications of the deep instinct that teaches men that despair, if it be genuine, reveals, if it does not sometimes make, character. It must be confessed that this tonic effect of objectifying and painting their wretchedness is not manifest in the pessimists of the present century.

There are many striking observations, with much that is labored and commonplace:—The first readers of any great book, Homer for instance, never appreciate it. It is the twenty-seven centuries of admiration that really impresses us. Because we cannot dissociate the two, we are ever mistaking the halo of fame for merit, and passing by books that are really better. Again, it may be that, from any of many other causes, it is our mind that is exalted rather than that the book is good. A book that makes a good first impression is cheap. Hence, literary fame is a matter of chance and often of mediocrity. Talent is a misfortune, for it may lead to that most absolute isolation which is found just ahead of our fellows; it may lead us to the illusion of living for posterity, who will, in fact, be as much meaner than we as we are than our ancestors, while at best it may barely get us a living by serving as a deformity one begs alms for showing. The best thing it can do is to devise a method by which the author is outstripped, forgotten, and perhaps, like Bacon, despised. The truest philosophy is abstinence from philosophy, and perhaps to become "only a trunk which feels and suffers," for the greater the mind the more the *ennui*. Our age is so mechanical that we may yet have even safety-valves for egotism: paths of honor, glory, virtue, etc., traversed by steam-power, etc.; and, as a pig's soul was said to be only a function or element like salt, which keeps the pork fresh till it is wanted for the table, so the human soul, if it would have a higher quality, must seek it by imitating the birds, which have the most perfect senses, are the most constantly active, and have the greatest mo-

tion in several elements, and whose song, of which the lately-evolved human habit of laughter is a ghastly analogue, is about the only real thing of joy in the universe.

Eau-de-Nil: A Chronicle. By E. C. Hope-Edwardes. London: R. Bentley. 1882. 8vo, pp. viii.-319.

If it were not for one thing, this book might be dismissed with the remark that it is a commonplace narrative of a very familiar journey. Miss Hope-Edwardes has no mishaps nor adventures, not even the doubtful discovery of a buried tomb, to record. Accompanied by her brother, she went a little beyond the first cataract of the Nile in the winter of 1880–81, making the various excursions prescribed by the guide-books to the ruins on the river banks. We will do her the justice to say, however, that she does not inflict many descriptions of these places upon her readers, nor does she have a great deal to say about the dynasties or other subjects so dear to the Egyptologist. The one thing which gives the book any value is the very graphic picture which she draws of the persons forming the crew of her dahabieh. Having evidently a more than ordinary faculty for winning the confidence of her companions, and aided by a slight knowledge of Arabic, she used to the best advantage her many opportunities for talking with them. Parts of these conversations, "from notes taken at the time, or immediately afterwards," are given, and form by far the most interesting part of the book, as they present a clear and presumably truthful idea of the life of the Nile boatman, together with his opinions on many important subjects. Whether her boat's crew was an exceptionally good one or not, we do not know; but, judging from her account, the men seem to have been good-natured, faithful to their duties, honest as regards their employers, and by no means lacking in intelligence. Especially attractive was the steersman, Rais Abdallah, "a charming creature in appearance and manners," the story of whose life is given at some length.

Miss Hope-Edwardes apparently saw little of the suffering among the people which has so clouded the enjoyment of many recent Nile travellers. Beggars were of course numerous wherever the boat touched. Sometimes they were very amusing. One was a boy

"about ten years old, very ragged, and with a bright Murillo style of face. He went through every sort of infirmity in pantomime: first dragging himself along the ground with apparently no legs; then suddenly going blind, and feeling his way up to us; then ravenously hungry, eating the ground—with admirable change of countenance; and between each, asking for baksheesh with the most winning smiles and gestures. But we had to be firm, as there was a pack of wolves watching, who would have left us no peace if we had once yielded. At last his patience failed, and he changed suddenly, drew himself up, pulled a purse out of some deep recess in his bosom, opened it, and showed us some coins: shook it defiantly at us, and stalked grandly away, and a minute or two after we saw him peeping very cautiously round a corner to see what effect he had produced."

The following incident shows to what an extreme length the Eastern custom of offering refreshment during any business transaction is carried in Upper Egypt: "When St. L. went to the post-office to send a telegram he was also immediately accommodated with a chair and a cup of coffee, the clerk taking another; and so they went leisurely to work." There are few political allusions in the book, but several times the present Khedive, Tewfik, was brought into the conversation by the author's companions, and always in terms of praise. This was chiefly because of his reduction of the taxes. For instance, Abdallah, whose home was on an island at the foot of the first cataract, says: "I have a little land—hardly any, but those maize-cakes you had came off it, and there are two or three date-palms. I pay tribute for it. It used to be five guineas a year; now Effendina—may Allah lengthen his life!—has made it two guineas and a half."

Eastern Proverbs and Emblems, illustrating Old Truths. By the Rev. J. Long, Member of the Bengal Asiatic Society, F.R.G.S. London: Trübner; New York: Funk & Wagnalls.

The compiler of this volume assures us in his preface that the materials from which it has been drawn are scattered through more than a thousand volumes, some of them very rare and to be found only in Indian or Russian libraries, or in the British Museum. The marks of diligence are upon every page. But diligence is not sufficient for the making of a good book. This one contains many admirable things, and yet, as a whole, might have been much better. Its contents are divided into three parts, "Proverbs and Emblems chiefly Moral," "Proverbs and Emblems Moral and Religious," and "Proverbs and Emblems Religious." These divisions are quite arbitrary. Not only is the character of the proverbs under the different heads very similar, but the same proverbs turn up again and again under them. The compiler has not been so strict as he might have been in the construction of his title—'*Eastern* Proverbs and Emblems.' When these are Russian he justifies himself easily, but when Italian, the only justification can be that we are all Eastern in the last analysis. Still, the proverbs here are mainly Eastern, and few better can be found anywhere. They are convincing proof that the Eastern mind was very apt at this gnomic wisdom.

If only Mr. Long had been content to give us the proverbial wisdom of others and had spared us his own lucubrations! On the contrary, every set of proverbs is introduced with a verse from the Hebrew or Christian Scriptures, and then we are treated to a homiletic commentary of the most trivial and inane description, into which are dragged as many Scripture texts as have even the remotest or most fanciful connection with the matter principally in hand. Anything drearier than the outcome of this method, followed up through several hundred pages, it would be difficult to conceive. But the intelligent reader, after becoming well apprised of Mr. Long's personal quality, will skip his homilies and be only grateful to him for the proverbs he has brought together.

Practical Dog Training; or, Training vs. Breaking. By S. T. Hammond. *Forest and Stream* Publishing Company.

It was for years the generally accepted theory that the education of pointers and setters could only be accomplished by the assistance of frequent and vigorous beatings, with an occasional charge of fine shot at long range in the finishing branches. Later the use of the cord was for some time much advocated for field instruction; whippings became rarer and shootings were almost dispensed with. Now Mr. Hammond boldly advocates the plan of teaching a dog "all it is necessary for him to know without a single blow being struck or a single harsh word being spoken," and claims that by adopting his method you can "invariably succeed in turning out a well-trained, well-behaved dog." Every one interested in dogs should read Mr. Hammond's book, as the same general rules of instruction will apply to any well-bred, intelligent animals so far as improving their general conduct and agreeableness goes. Mr. Hammond begins his dogs' training in the early days of their puppyhood, and is very sensible in preferring descendants of well-bred field performers to mere winners at bench shows. The education goes on slowly but persistently in a way to enlist the affection of the pupil in assistance of his instinct, and to teach him to obey from love and desire of reward instead of from fear. Mr. Hammond asserts that aside from the greater humanity of his method, the results obtained are much more favorable than by any other. The printing of the book is execrable.

BOOKS OF THE WEEK.

The Nation.

NEW YORK, THURSDAY, JULY 20, 1882.

The Week.

At the Stock Exchange, buoyancy and advancing prices were the characteristics of business, and, for the first time in over a year, the public at large were buyers in an important way of stocks the value of which is chiefly speculative. This indicates that after a year of poor crops and comparative depression, caused by the liquidation of the great speculation which followed the resumption of specie payments, the prevailing opinion is that the business of the country will now take a fresh start toward activity and prosperity. The crop news during the week has been of the best, and the indications are that, whether the Egyptian troubles spread or not, this country will have in the coming year the best foreign market for its exportable surplus that it has had for years. An event of the week was the enactment of the Bank Charter Bill, the main purpose of which was to extend the charters of the national banks with the least possible friction or disturbance. The bill was encumbered with several objectionable sections. One of these relates to the issue of gold and silver certificates, and compels the banks to sever their connection with any clearing-house which does not permit settlement of differences to be made in silver certificates. As the latter are not a full legal tender, and any one receiving them can only pay them to the Government for customs duties, and as the section relating to them is obscurely drawn, it is likely to fail of its purpose; but that there might be no apparent opposition of the New York banks to a law of Congress, the New York Clearing-house met and rescinded that part of its resolutions of 1879 which seemingly conflicted with the new law. Another section of the new law forbids the over-certification of checks, and was directed against a custom which all the banks having Stock Exchange accounts have safely practised for years. This action may lead to the establishment of a Clearing-house for Stock Exchange transactions; but for the present the banks "accept" checks, where before the custom was to "certify" them. The foreign demand for American securities has increased during the week, and none of the foreign markets have been unfavorably affected by what has occurred in Egypt. British Consols have been very firm, and have advanced slightly.

The appropriation of $15,000 to enable the President to carry out the United States Statute relating to the selection of persons for the civil service, moved by Mr. Bayne in the House the other day, was contemptuously rejected, only five Republicans voting for it. Since then the eyes of the majority seem to have been opened by the comments elicited by this very remarkable performance, and on Thursday the appropriation was made by an almost equally large majority. The contempt of a considerable body of Republican legislators for the law of the land seems, in fact, to be fully as great as for civil-service reform and party professions thereon. Here is the statute, passed as long ago as 1871, which they have of late been deliberately and insolently refusing to give the President the means of executing:

"The President is authorized to prescribe such regulations for the admission of persons into the civil service of the United States as may best promote the efficiency thereof, and ascertain the fitness of each candidate in respect to age, health, character, knowledge, and ability for the branch of the service in which he seeks to enter; and for this purpose he may employ suitable persons to conduct such inquiries, and may prescribe their duties and establish regulations for the conduct of persons who may receive appointments in the civil service."

The Pennsylvania Independents have promptly declined to be caught in the trap set for them by Mr. Cameron. At the same time they tried to deprive the Stalwarts of the political capital the latter expected to make out of an unconditional rejection of their proposition for reunion, by submitting a counter proposition which had the merit of fairness and was put forth as an ultimatum. It was to the effect that both the Stalwart and Independent tickets should be withdrawn, and that the several candidates should "pledge themselves not to accept any subsequent nomination by the proposed new convention." This proposition was signed by four of the Independent candidates. It must be observed, however, that the mere withdrawal of the candidates on both sides, and the mere defeat of Mr. Cameron's effort to make General Beaver Governor of Pennsylvania, do not meet the programme of the Independent movement. If the whole thing were to end there, it would fall very much short of the requirements of the times. Those requirements have been far more broadly and correctly appreciated by Mr. McMichael, the Independent candidate for Congressman-at-large, who refused to subscribe to the proposition signed by his fellow-candidates, and wrote a separate letter, in which he defined his position and purposes as follows: "I will not withdraw or retire unless events hereafter give assurance that the necessary reform in the civil service shall be adopted, assessments made upon office-holders returned and not hereafter exacted, boss, machine, and spoils methods forever abandoned, and all our public offices, from United States Senators to the most unimportant officials, shall be filled only by honest and capable men, who will represent the people, and not attempt to dictate to or control them."

The Civil-Service Reform Association has replied to Mr. Hubbell's letter in a way which would cover anybody else with confusion. In his letter of June 22 he loudly demanded that a test case as to the legality of assessments on office-holders should be at once made up and tried. He "disdained to seek shelter behind any cover," and was ready for "any form of action in any tribunal." This challenge the Association accepted, and proposed to go before the Circuit Court without further delay. Mr. Hubbell, however, immediately backed out, and expresses no further interest in a judicial decision. The Association replies to his argument, based on the "voluntary" character of the payments, by calling his attention to the fact that the statute prohibits all payments, whether voluntary or involuntary. Mr. Hubbell is, however, so entirely shameless as to be beyond the reach of argument. Nothing short of criminal proceedings is likely to have any effect upon his mind.

The altercation between Mr. Hewitt and Mr. Robeson in the House of Representatives on Monday is another symptom that the temper of that body has grown too ugly for useful discussion and good legislative work. The first attack made by Mr. Hewitt on Mr. Robeson was, no doubt, fully justified. It is no unusual thing for a Senator or Representative, when revising the stenographic report of his speech, to cut out surplusage and repetitions, or interpolate here and there sentences that may be necessary to the clearness or continuity of the argument. Such things are frequently done without being noticed or commented upon. But when the interpolation consists in a personal attack upon a member of the Senate or the House which appears in print in the *Congressional Record*, and thus goes before the people without having been pronounced on the floor, the case is different. The gross impropriety of such a proceeding is obvious, and it might be characterized even by a stronger term. This is the thing which Mr. Robeson had done, and Mr. Hewitt, when he found himself personally attacked in the printed report of Mr. Robeson's speech, while Mr. Robeson had not uttered a word of that attack on the floor, was perfectly justified in inviting the attention of the House to it, and in asking to have that part of Mr. Robeson's speech expunged from the record. But he would have done better not to permit himself to be betrayed into a personal altercation with that gentleman. Mr. Robeson's standing before the country has for a long time been such, and it has been recently so much impaired by what he called his "vindication," that a parliamentary tilt with him cannot be creditable to anybody.

Mr. Elmore's letter to Mr. Randall with regard to the Crédit Industriel, and the support given it by Mr. Blaine, contains one important bit of testimony, which shows very clearly the real object which lay behind all Mr. Blaine's South American diplomacy. At one of the interviews at the State Department, at which Mr. Randall and Mr. Elmore were present, the question, it seems, arose as to what the United States would do in case Chili should insist on taking territory. While they were talking, Mr. Blaine sent a messenger over to the Navy Department, and in a few minutes a memorandum was brought in, which he handed to his visitors. It proved to contain a list of the vessels which the United States then had in the Pacific. Mr. Randall said: "This is too small a force for any demonstra-

tion against Chili." Mr. Blaine replied that the force did not signify, as "they were quite sufficient to make Chili understand what she might expect."

There is a good deal of excitement in North Carolina over a proposal made by a negro named Harris to have a "joint discussion" with Governor Jarvis before the people of the State. The suggestion was audacious enough in itself, but was made more dreadful still by the fact that Harris sent his message to the Governor by a white man, who is said to have been during the war a "gallant Confederate soldier." According to the Raleigh *News*, Harris "claims" that the people are ready for absolute equality, but the *News* says he is mistaken; that they are willing to have equality, but not so much equality as this. Governor Jarvis, at any rate, is not ready for it, for with a great deal of quiet dignity he told the messenger that "he had no reply to make." As it takes two to make a joint discussion possible, the North Carolina whites have this matter entirely in their own hands. When such revolting proposals are made them, all they have to do is to refuse, and no joint discussions will ever take place. In a community so intelligent as North Carolina, quiet will undoubtedly be restored as soon as this is generally understood.

The trouble over Walt Whitman's 'Leaves of Grass' has reached Philadelphia, where the Society for the Suppression of Vice and Immorality are endeavoring to have its circulation through the mails stopped. On the other hand, the Reverend Mr. Morrow, a Methodist clergyman, has come to the rescue of the book, which he says is the result of a "theory" of the author on the subject of the true function of poetry, and, though "robust and virile," is not an obscene publication; and he defends the book in a discourse of considerable length. There are two observations to be made with regard to this—that the law for the protection of the mails cannot be enforced if the character of the literature circulated is inferred from the "theory" which the author gives out as the explanation of it. In law the theory is mainly inferred, like any other intent, from the publication itself, and the explanations of the author are of comparatively little value as evidence. Another point is that public discussion of the question at issue does not advance matters much, for the poems which the District-Attorney is asked to look after are so "robust and virile" that few newspapers have dared to publish them. For the public to make up its mind, it is necessary to see the poems, and a discussion without copious quotations is consequently barren. If Mr. Morrow will read to his congregation some of the verses which he defends, the pewholders will then be in a position to judge whether they want to hear anything further about the "theory." Any one who takes up the cudgels against Zola or Whitman is obviously handicapped unfairly unless their defender will give extracts. Motives of delicacy forbid quotations to those who think them very disgusting; but the believers in their "theories" need not feel any restraint.

There was a very diverting scene at the prayer-meeting in Plymouth Church on Friday when Mr. Beecher made some remarks on the year's work. Mr. Thomas G. Shearman, famous ten short years ago as Fisk and Gould's lawyer during the disgraceful prostitution of the courts in their behalf, for which Judge Barnard was afterward tried and convicted, was present and humorously accused his pastor of conservatism. Mr. Shearman, who was then as now a church-member in good and regular standing, had at that time one of the most robust consciences in the State of New York, which enabled him to engineer some of the worst legal outrages ever perpetrated, without winking. Mr. Beecher, therefore, who is his pastor and friend, evidently trusted to the shortness of the public memory—which, alas! is very short—when he told on Friday an anecdote of Mr. Shearman's having been so scrupulous, when he was first Clerk of the Church, "that having been brought up a Baptist, and not believing in infant baptism, when it became his duty to record the baptism of children he came to Mr. Beecher and asked if he could conscientiously record such baptisms and become privy to them." We are copying the *Tribune's* report. Now, we greatly fear the advice the pastor gave in this very delicate case was the beginning of Brother Shearman's fall, for he was told, evasively and jesuitically, as it seems to us, that "he was a mere historian, and in recording facts was in no sense privy to their commission." We do not know in what year this solemn scene took place, but we cannot doubt that the violence which Mr. Shearman was then led, through his pastor's demoralizing suggestions, to do to his convictions about infant baptism, prepared him for that exceedingly paying but by no means scrupulous practice which he afterward carried on in Fisk's Opera House. Mr. Beecher has undoubtedly ruined one of the most sensitive things in the way of a moral sense ever produced on Long Island. Had Shearman retained his pristine conscience, he never could have borne even the approach of men holding such broad views about baptism, both infant and adult, as Fisk and Gould.

The last news from Egypt, though very confused, seems to indicate that Arabi Bey has still a small force—about five thousand men—with him outside Alexandria; but desertions from him are going on, and it is more than probable that if he has to move, his men will disperse, as the British have offered rations to those who return to their duty, and the Khedive has issued a proclamation ordering them to go home to their villages. This *débandade* will be precipitated by the rapid arrival of troops from England, and probably also from France, as, according to the latest news, the French have consented to share with England the task of protecting the Canal. It is not probable that the troops in following Arabi's fortunes really looked forward to active service against European troops. The prospect which opened itself to them was the one which brings about nearly all military revolts—that of reducing the Government to submission, getting rid of the European officials, and ruling the country in their own fashion. Mutineers are seldom long-headed politicians. The Conference has, it is reported, decided to ask the Sultan to send troops to restore order, but only for three, or at most six months. Whether his sovereign pride will permit him to interfere under these conditions remains to be seen. If he does, we may be sure it will be with a secret determination to stay as long as he can, and we shall probably witness again the process of bullying him into the performance of his contract, he all the while hoping for a quarrel over himself among the Powers. The situation is full of the seeds of future complications. The main hope of avoiding them must be based on the fear of them by which all the parties concerned seem to be agitated.

The instructions of his Government to Admiral Seymour were read in the House of Commons on Thursday, and do much to excuse his apparent supineness, and to account for Arabi's escape. They appear to have been based on the assumption that the fleet was simply assisting the Khedive in restoring his authority, and, therefore, was to do as little damage to his premises as possible. After the Admiral had silenced the forts, he was not to "dismantle them or disable the guns," but was to "open friendly communications with the Khedive," and land sailors and marines, "in concert with the Khedive," for "police purposes," and if any foreign men-of-war present wished to coöperate in these gentle and humane measures, they were to be invited to do so. Unfortunately there seems to have been no sort of relation between these instructions and the facts of the situation to which they were to be applied. They supposed the Khedive to have some sort of force at his command, which the British sailors and marines could strengthen. The fact was that he had no force but himself, was the next thing to a prisoner before the bombardment began, and actually a prisoner after it began. Coöperation with him, therefore, in any military sense, was impossible. Fleets and armies coöperate with other fleets and armies, and not with solitary middle-aged individuals. The order not to dismantle the forts, or disable their guns after silencing them, we do not well know how to characterize. Bombarding a fort with the concentrated fire of the most powerful artillery of modern times is so rough a proceeding, that a warning to the commanding officer to handle the fort tenderly after it has been silenced seems too naïf to be genuine, and yet genuine we suppose it is. The order that the sailors and marines, too, were to be landed as a police force only reveals still more plainly that the Ministry thought they were going to deal with an *émeute* and not with a war, but their thinking so was on its face absurd and unaccountable. Rioters do not hold forts, or if so, do not need to be expelled from them by a fleet of iron-clads. Certainly any rioters who stood a bombardment of many hours from a British fleet of the largest size ought not to be pursued by police, but by soldiers

After these instructions, it is not surprising that Mr. Gladstone should have accounted for his failure to take precautions against the awful scenes which marked the evacuation, by saying that the "Government could not have anticipated them." If they thought their attack on the forts was merely a little police duty, their surprise was natural enough. What they have to explain is, however, their failure to consider that any operation which called for the guns of a whole fleet was war, and war on a considerable scale, and their failure to perceive that there can be such a thing as limited war—or war that is to be fierce in the morning and mild in the afternoon. The officer who resisted the fleet in the forts was, it was plain to be seen, a desperate, and reckless, and very ignorant man. None but the desperate, reckless, and very ignorant would have attempted such a feat with the means at his disposal. Moreover, his rule in Alexandria had been marked a month previously by a massacre of Christians which he took no pains to prevent; and this in time of peace. There was, therefore, every reason to fear that, if maddened by defeat, and driven from the city, he would permit or perpetrate similar crimes. This would have been true even if he were not an Oriental Mussulman—a kind of man which the Gladstone Ministry certainly, that almost rode into power on a wave of horror excited by the doings of the "unspeakable Turk" in Bulgaria, had no excuse for not understanding. The almost bestial ferocity which lies sleeping under even the most polished Mussulman exterior is, in fact, something of which no class of men in our day have had more experience than British officials, both civil and military.

The *Pall Mall Gazette* suggests that the true way to protect the Suez Canal is not by attempting the all but impossible task of guarding it from one end to the other, but by getting hold of the Government of Egypt. It has, in fact, to be protected by that now well-known rule of modern warfare, which bids you reduce the enemy's fortresses and take his capital by destroying his armies in the field. When there is no force outside of them left they fall inevitably. In like manner the way to secure the Canal is to destroy the power, whatever it be, which menaces it, or, in other words, to seize the Egyptian Government. This, we presume, the British will now do. It would show extraordinary incompetency or timidity if they allowed Arabi and his force to escape from the trap which he has deliberately prepared for himself and walked into. Much of the trouble has been due to their failure to convince Arabi at the outset that they would not permit him to set up as a dictator. Had he been told so in peremptory language six months ago, things would never have reached their present pass, and an enormous loss in property, to say nothing of the loss of life, would have been prevented.

Of course, after Arabi has been deposed, and order restored by England, the other Powers, and particularly France, will have somehow to be satisfied. Now that the bombardment has taken place successfully, and England has got all the glory of it, there are some signs that the French are annoyed by the timidity of their own Ministry, and more or less with England, and that there will be some rough places in the negotiations for the final settlement. But these will undoubtedly be overcome without trouble, because the Gladstone Ministry is in no Jingo mood, and has no ulterior designs, although it almost certainly would not have entered into the joint control with France, and would not have told her to work her will with Tunis, as Lord Salisbury did. Thus far the military part of the enterprise has turned out most fortunately for the Cabinet. It has cleared them of the charge of timidity and irresolution which had begun to rest heavily upon them, and has put the British people in good humor with them; and these things they sorely needed.

The resignation of Mr. John Bright from the Cabinet on account of his conscientious objections to war, and to military meddling with foreign states, is probably as fitting and honorable a close as could come to a long and illustrious political career. For close it is, we greatly fear. He is over seventy, and is not robust, and could hardly have held any position in the present Ministry which was not, like the Chancellorship of the Duchy of Lancaster, a virtual sinecure. But he would have cast a shadow on some of the best years of his public life had he allowed himself to become in any way responsible for the extension of English influence at the cannon's mouth. A strictly defensive war he might have stomached—though of this we are not quite sure; but a bombardment of the aggressive-defensive kind he could not connive at and remain the John Bright of the forty glorious years of English history in which he has played so great a part.

Lord Granville's expression of regret in the House of Lords that England should be compelled to "use force against the weak," apropos of the bombardment of the Egyptian forts, is a curious illustration of the way in which a certain kind of cant survives for indefinite periods the facts to which it owed its origin. Reluctance to attack the weak was a product of mediæval chivalry, and was cultivated in the days when fighting was considered a good thing in itself, and valued much for its spectacular effects. It lingers still in the duelling and boxing rules, which place the combatants as far as possible on terms of strict equality, and it every now and then comes up in attempts to justify misdirection of political sympathy, as when during our rebellion English Tories used to pretend that they sided with the South because it was the weaker party, and thought Captain Winslow acted unfairly because in the fight with the *Alabama* he protected his engines and boilers by hanging his chain cables over the side. But it has no place whatever in modern political ethics. Nations do not now fight for fun, or to show how brave they are. They fight to have their way about something. So far, too, from regretting that an enemy is weak when they attack him, they openly rejoice in it. In fact, they try to weaken him, or wait till they think he is weak, before they attack him. Just as it is a fatal fault in a modern general not to be strongest at the point of collision with the enemy, it is a fatal fault in a modern statesman to go to war unless he has allies, or has some advantage over the enemy in numbers, or resources, or armament. Finally, it is nearly always the weak whom modern Powers go to war with. They seldom attack their match, and always do so with great reluctance. In fact, they consider it barbarous to do so. Their improved weapons are nearly always used against communities which do not possess them. All England's wars since 1815 have been against the very weak. She keeps Ireland because Ireland is weak, and holds India because the Hindoos are weak, and bullies Turkey because Turkey is weak. Weakness among nations has a touch of immorality about it, because national strength comes from national virtue. It is the product of industry, order, forethought, love of country, determination, and persistence. It is these things which make nations able to thrash the weak; it is the absence of them which prepares the weak for the thrashing. The fittest survive, even more surely among nations than among individuals.

The Sultan must be the most bewildered of all the actors in the Egyptian trouble. He finds all the Powers full of respect for his sovereign rights until he wants to enforce them, when they peremptorily forbid it. When he proposed, some months ago, to interfere in Egypt by sending his troops and iron-clads to Alexandria, France and England warned him that he must not attempt anything of the kind. Then they summoned a Conference at Constantinople to settle by European concert what should be done in Egypt, and invited him to be represented at it. But as some previous conferences have resulted in stripping him of territory, under pretence of making him stronger, he naturally declared that there was no need of a conference at all, and that if they held one, he would have nothing to do with it. The Conference, however, was held, and he probably supposed that it was really going to settle what should be done in Egypt. What then must have been his surprise to hear that while the Conference was still sitting England had begun proceedings in Egypt on her own account, and was fighting Arabi Bey without the slightest reference to what anybody else thought about it. He naturally supposed that this would be a good time to call attention to his "sovereign rights," and telegraphed to London to ask to have the bombardment stopped, because it was a serious violation of these sovereign rights to bombard one of his cities without notice to him. But Lord Granville made answer that the bombardment could not possibly be postponed, and that he must not give himself the least concern about his sovereign rights, as they would be scrupulously respected. This must lead him to inquire more seriously than ever before what his sovereign rights are. Whatever they are, they are evidently of no earthly use to him.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, July 12 to TUESDAY, July 18, 1882, inclusive.]

DOMESTIC.

IN the Senate, on Wednesday, the consideration of the River and Harbor Bill was concluded. Mr. Morrill's amendment, providing that one-half of the money appropriated shall be expended before June 30, 1883, the remainder to be spent in the discretion of the Executive, was lost, by a vote of 16 to 45. The vote on the bill was then taken, and it resulted, yeas 39, nays 23.

The Internal-Revenue Bill came up in the Senate on Thursday, and the tariff debate began. One of the significant features was a high-tariff speech by Senator Voorhees, of Indiana, who, some time ago, was declaring for free trade. Senator Morgan also spoke, opposing the introduction of a subject for the consideration of which the Tariff Commission had been created. On Friday Senator Bayard made a speech, in which he pointed out in what respects the bill falls short of what a measure for the relief from burdensome taxation should be, under existing circumstances.

After a discussion lasting from 2 until 4:30 o'clock, the Senate on Saturday passed the one-hundred-million-dollar Pension Bill without objection.

A proviso has been added to the first section of the Internal-Revenue Bill, by the Senate Finance Committee, by which manufacturers of matches can remove them to warehouses under bond, after August 15, 1882, without attaching the stamps required by law.

During the debate in the House of Representatives on Wednesday afternoon, on the Sundry Civil Appropriation Bill, which contains an appropriation of more than $500 to pay one of the new stenographers, a bitter attack was made upon Speaker Keifer's summary and unjust removal of certain competent stenographers. The wrangle continued for about two hours. On Thursday an amendment, appropriating $15,000 to enable the President to carry out the provisions of the civil-service-examination section of the Revised Statutes, was adopted by more than a two-thirds vote. The bill was then passed.

The House indulged in a long and unseemly wrangle, on Friday, over the bill making an appropriation for the expenses of President Garfield's sickness. Mr. Kasson, of Iowa, came to the rescue with a proposition to close the debate by unanimous consent. The Senate amendments were then voted down, and the items of compensation were passed substantially as originally recommended.

The House voted on Saturday to non-concur in every one of the 150 amendments made by the Senate to the River and Harbor Bill. The House will sustain the Committee of Commerce in its announced policy of reducing the aggregate of the bill by about $2,000,000. The Committee expects to strike out the provisions of the bill making appropriations for surveys for the Hennepin Canal and the Delaware and Chesapeake Canal. The House also refused, on Saturday, to agree with the Senate amendments to the Legislative Bill in regard to the equalization of the pay of employees of the Senate and House.

On Monday the bill providing for a third grade of letter-carriers and for promotions was passed by the House. The Senate bill to provide additional industrial schools for Indian youths, and authorizing the use of unoccupied military barracks for such purposes, was also passed by the House.

An angry colloquy took place on Monday afternoon in the House, between Mr. Robeson, of New Jersey, and Mr. Hewitt, of New York. Mr. Hewitt rose to move to strike from the *Record* a part of Mr. Robeson's recent speech, which charged Mr. Hewitt with falsehood in making certain statements as to Mr. Robeson's actions. Mr. Robeson rose in great excitement and accused the member from New York of using still worse language than he himself had employed. In the course of his remarks he again defended his administration of naval affairs. The angry dialogue was stopped by a point of order.

The House voted on Monday to permit the Secretary of the Treasury to sell the old Post-office property in this city, for not less than $600,000, at public auction.

The bill to enable national banks to extend their corporate existence has been approved by President Arthur and is now a law.

Senator Ben Hill, of Georgia, is worse, and his death is looked for at any time.

Senator Joseph Brown, of Georgia, has given $50,000 to the University of that State at Athens, the interest of which is to be used for educating poor young men.

Mr. Robert R. Randall has been permitted by the Foreign Affairs Committee to file a sworn statement, supplemental to his testimony in the Peruvian Investigation. In the statement he reaffirms that Mr. Blaine, when Secretary of State, not only countenanced but warmly approved the programme of the Crédit Industriel, which, to a certain extent, implied an American protectorate.

The Tariff Commission has issued a circular, inviting correspondence from all associations, corporations, and individuals interested in the subject of its inquiries, and desiring to furnish information or testimony for its consideration in the discharge of its duty.

The special Grand Jury of the Criminal Court of the District of Columbia was given its instructions by Judge Wylie on Wednesday, and straightway began the consideration of the new evidence in the Star-route cases. On Friday they entered the court-room and announced that they had considered the evidence presented to them and had found no indictments. They were then dismissed. On Thursday, Judge Wylie made an important decision, admitting evidence of matters anterior to the date of the conspiracy as set forth in the indictment.

Through Mr. George Bliss, its counsel, the Government has agreed to submit a part of the Salisbury and Parker Star-route cases to arbitration, the arbitrators to be Second Assistant Postmaster-General Richard A. Elmer, Mr. George Bliss, or some one named by him, and Mr. Robert G. Ingersoll, or some one named by him. It is reported that the Government expects to secure the repayment of about $150,000 by this arbitration, which could not be recovered in any other way, except by long litigation.

It is understood that the Civil-Service Reform Association, of this city, will endeavor to present, as soon as possible, to the United States Grand Jurors, the names of office-holders who have contributed to Mr. Jay Hubbell's campaign committee in violation of the statute against political assessments. The counsel for the Association have written another letter to Mr. Hubbell, in which they point out that he has failed to follow out his own proposal, that a test case be brought before a circuit court; and that the discussion as to whether the contribution is voluntary or not is legally of no consequence, as, in either case, payment is prohibited.

A meeting of the Republican State Central Committee of Pennsylvania was held in Philadelphia on Wednesday, nearly 100 members being present, for the purpose of taking steps to secure harmony in the party. The Regular candidates expressed, by letter, the desire to submit their claims to any test deemed wise by the Committee. The Chairman was then empowered to submit four propositions to the Independents, any one of which would be acceptable to the Regulars. The propositions are: That both tickets be submitted to the popular vote of the party at the primaries, the one securing the most votes to be the ticket of the whole party; that a ticket, open for any candidate, be selected by primary elections; that a new Convention, under the rules adopted by the Continental Conference of Stalwarts and Independents, be called; that a new Convention be held under the rules adopted by the Republican Convention of May 10.

The Independent candidates held a conference in Philadelphia on Thursday, and declined to consider the four propositions. They then prepared an ultimatum to submit to the Regulars, which was signed by four of the five candidates on the ticket, the exception being Col. William McMichael, who is named for Congressman-at-large. The ultimatum sets forth that the Independents believe that the propositions of the Stalwarts would not secure the desired unification of the party, and declares that they will only compromise on the basis of the withdrawal of the candidates of each faction, and a pledge from the candidates that they will not accept renomination. Col. McMichael wrote a letter, in which he said that he would not withdraw "unless events hereafter shall give assurance that necessary reforms in the civil service shall be adopted; assessments made upon office-holders returned and not hereafter exacted; boss, machine, and spoils methods forever abandoned; and all our public offices shall be filled only by honest and capable men who will represent the people, and not attempt to dictate to or control them."

Chairman McKee, of the Independent Republican State Committee of Pennsylvania, has issued a call for the meeting of that body on July 27, to consider the four propositions of the Stalwarts, which the Independent candidates, speaking for themselves alone, rejected. It is believed that the Committee will also reject the propositions, and probably refuse to sanction the ultimatum of the four candidates.

At a meeting of the Democratic State Committee of Virginia, in Richmond, on Wednesday, it was agreed not to call a Convention to nominate a Congressman-at-large, nor to endorse any candidate for that position. This practically commits the Democrats to the candidacy of ex-Auditor John E. Massey, at one time a leader of the Readjusters, but now a personal enemy of Senator Mahone.

The Democratic Territorial Convention of Arizona, which met on Wednesday, condemned the Republican government of the Territory for quartering hostile Indians within its borders. They demand that the Indians be removed or disarmed and turned over to the War Department.

The National Educational Association and the American Institute of Instruction held their annual meetings at Saratoga last week.

The great iron-workers' strike is now over in the St. Louis district, and all the forges and mills are at work. The employees consented to resume work, under the Cincinnati agreement, until a settlement of the existing difficulties at Pittsburgh can be effected.

Fifty-one families of Russian refugees, who came to this country a few months ago, returned to Europe on Friday, having failed to get work.

Crop reports for the past week are more encouraging for the corn prospects in Illinois. The Kansas wheat crop has been harvested, and surpasses the estimates made by the State authorities. It is the largest ever harvested there.

A terrible storm passed over Texarkana, Arkansas, on Wednesday evening. Half an hour later a large brick building fell upon a neighboring saloon, burying more than two score of people in the ruins. Few of them were rescued alive.

It is stated in Washington that the bouquet which Mrs. Scoville endeavored to convey to Guiteau on the day preceding his execution has been analyzed, and that enough arsenic was found in it to kill several men. Mrs. Scoville emphatically denies that she poisoned the flowers. There is also an apparently well-founded belief in Washington that the body of Guiteau still rests in the grave under the floor of the United States Jail, and has not been removed to the Army Medical Museum.

General O. O. Howard, Superintendent of the West Point Military Academy, will be relieved by Col. Wesley Merritt.

Mrs. Lincoln, widow of the late President Lincoln, died in Springfield, Ill., at 8:15 o'clock on Sunday night. She had been ill for a long time. She was a member of an old Kentucky family, and was born in 1821. Her maiden name was Mary Todd. She was married to Abraham Lincoln in 1842, when he was an attorney of some prominence in Springfield.

Bishop Scott, senior Bishop of the Methodist Episcopal Church, died at his home near Odessa, Delaware, on Thursday, at the age of eighty.

José Domingo, a Carlist exile from Spain, who settled in New Orleans forty years ago and accumulated a great fortune, died on Sunday, July 9. His will leaves the bulk of his wealth to ex-Secretary of the Navy William H. Hunt, now Minister to Russia. Domingo was an old friend and admirer of Mr. Hunt.

Lewis H. Redfield, one of the oldest printers and journalists in the country, died in Syracuse on Friday, at the age of eighty-nine.

FOREIGN.

After the first day's bombardment at Alexandria, Egypt, a quiet night was spent by the British fleet in the harbor. When Wednesday morning dawned, the wind was blowing strong, in the enemy's favor, and the sea was rough, causing the war ships to roll so violently as to interfere with the efficacy of the heavy guns. At 6:30 o'clock the order was given to load with common shell. The *Inflexible* and *Téméraire* opened fire on the Moncrieffe fort, which had been repaired during the night. Only a few shots had been fired, eliciting no response from the forts, when a flag of truce was seen displayed in the town, and a steamer approached the fleet, also showing a similar ensign. The signal was given to cease the cannonade. The *Bittern* was sent to communicate with the Egyptians. The Military Governor of Alexandria conducted the conversation for the Egyptians, and Lieutenant Lambton for the British. Lieutenant Lambton informed them that he had not come to offer conditions, but to receive proposals. He said, however, that Fort Mex must be occupied by English troops and Fort Marabout be destroyed. The Egyptians replied that the latter fort had already been deserted, but they would give no answer as to Fort Mex. The Military Governor made no proposals, and Lieutenant Lambton steamed back to the Admiral's ship, about 3 o'clock in the afternoon, and informed him that the evident object of the flag of truce was to gain time. At 5 o'clock, the Egyptians having hauled down their flag of truce, the *Invincible* fired a nine-inch shell at Fort Mex, which was very effective. A white flag was again hoisted, and Admiral Seymour sent a message to the Egyptians that he accepted the flag of truce, but that it would be the last truce to which he would agree. During the afternoon several large fires broke out in the town. The loss of life up to that time among the Egyptians was estimated at about 2,000.

During Wednesday night the conflagrations in the city were seen to be spreading rapidly. At daylight on Thursday a flag of truce was discovered flying on the Ras-el-Tin palace. Four of the British fleet then steamed into the inner harbor, under the white flag. The real meaning of the fruitless negotiations of the day before then became apparent. Arabi Pasha merely wanted time, and during the afternoon and night the whole civil population and Army had withdrawn, and were in full retreat toward the interior. Released convicts and lawless Bedouins remained behind for a few hours. A reign of terror ensued. The European quarter of the city was fired and sacked. Christians were banded together in many strong buildings for self-defence, but they were overpowered and massacred by hundreds. One band of a hundred succeeded in fighting its way to the beach, whence the boats of the fleet removed them. The atrocities committed by the plunderers were terrible. The French Consulate was burned to the ground. Marines were landed by Admiral Seymour, with Gatling guns, to disperse the plunderers. The force was meagre and it had to proceed with great caution. There was some short, sharp fighting, but the Arabs continued looting the town until Friday noon. Admiral Seymour was informed that a large force of Egyptian soldiers were encamped outside the town, ready for attack. With his small force he could not be very aggressive, but the marines spiked a number of guns and held the Arsenal and Custom-house gates. Orders were given them to shoot plunderers on the spot, and the execution of the order had a good effect.

The Khedive was found safe in his palace. During the bombardment he was in great peril. Just before his flight, Arabi gave orders that the Khedive be murdered. A party of soldiers entered his apartment to commit the deed, but after long parleying their loyalty was bought by promises of money. They then escorted him to the Ras-el-Tin palace, and 700 British marines mounted guard. All the Ministry except Arabi Pasha presented themselves to the Khedive, and pledged their loyalty. He immediately took measures to reëstablish order, with the assistance of the cavalry and infantry guards who remained loyal to him. The leading Pashas were summoned to the palace, and the Khedive coöperated with Admiral Seymour. The American Admiral was requested to assist in restoring order, and he landed sixty marines, who shared in patrolling the streets. The fire raged during Friday, and two-thirds of the city was destroyed. It was learned that Arabi's forces had become greatly disorganized, two-thirds of them having deserted during the bombardment. Arabi himself, it was said, had fled from the city by a boat on the canal, but his whereabouts was unknown. By 11 o'clock on Friday night the fire had ceased to spread, and nearly all plundering had ended. The English Consulate and the quarter containing the great grain and cotton stores were not burned.

On Saturday confidence was so restored among the people that cafés and shops began to reopen. It was possible to walk the streets without a military escort. The day was spent by Admiral Seymour in organizing a police force. Thirteen hundred Christian refugees were discovered who had been saved in a Coptic church during the massacre.

Admiral Seymour issued a manifesto on Monday, announcing that he had undertaken, with the consent of the Egyptian Government, the restoration of order. Nobody was allowed to leave the town after sunset. The Admiral also made an offer of rations to such Egyptian soldiers as would return to allegiance to the Khedive. The total British force in Alexandria is now more than 6,000 men.

Arabi Pasha on Monday assumed a defiant attitude. He said in reply to a letter from the Khedive that he did not intend to make war, but as the Powers were determined to force an attack, he thought it better to fight at once. His army is strongly posted. He has issued a proclamation declaring that the Arabs must pay all taxes to him, and has appointed Ali Feima, a notorious Anglophobist, to the command of the Suez Canal. On Monday night the Khedive sent a messenger to Arabi with a formal dismissal of him from the Ministry. Arabi's army is now intensely discontented, and starving women and children surround it.

Monday night passed quietly in Alexandria. The fires in the city were all extinguished. The execution of three plunderers, during the day, in the Grand Square, had a good effect. On Tuesday native police were organized to act under the military police.

On Saturday, rioting broke out in Cairo, despite the endeavors of the authorities to maintain order.

In the House of Commons, on Thursday afternoon, the instructions to Admiral Seymour, which were as follows, were read: "That as soon as the opposition of the forts had ceased he should not dismantle them or disable the guns; that he should open friendly communications with the Khedive, and, in the absence of the native authorities from Alexandria, should land seamen or marines for police purposes, and that he should inform foreign commanders of these measures. The Admiral was also instructed to invite the Khedive to assert his authority in restoring order. The landing of a British force for police purposes was to be in concert with the Khedive or any native authority in Alexandria, and any of the European men-of-war were to be invited to coöperate." Protests were made from the Conservative benches against the feebleness of these instructions.

At Constantinople, the Conference of the Powers continued its sittings during the week. On Friday night the conclusion was reached that the Porte should be invited to send Turkish troops to Egypt to restore order and reëstablish the Government. On Saturday an identical note to that effect was presented to the Porte. The conditions of Turkish intervention in Egypt are understood to be as follows: The occupation of Egypt is to be limited to three months, at the expiration of which the Khedive can demand a prolongation. The cost is to be defrayed by Egypt. No European Commissioners are to accompany the Turkish troops.

The French Cabinet has resolved, at the invitation of England, to protect the Suez Canal jointly with that country.

Secretary of State Frelinghuysen believes that the American residents at Alexandria have suffered no harm, as they are all on board the ships or in the interior.

It was announced in the House of Commons on Saturday that Mr. John Bright had resigned the Chancellorship of the Duchy of Lancaster and, consequently, his seat in the Cabinet. During all the discussion on the Egyptian crisis Mr. Bright had been absent from the House, and his resignation was generally expected, on account of the opinions he has uniformly held on the subject of war, and armed intervention in the affairs of other countries. The London *News*, commenting, said: "By resigning, Mr. Bright has been honorably true to the convictions of his whole life."

The royal assent was given to the Repression Bill on Wednesday afternoon. On Friday morning, sixteen counties in Ireland, eight cities, and four baronies were proclaimed under the Act.

The Arrears of Rent Bill was considered by the House of Commons in Committee on Wednesday afternoon. On Friday the first four clauses were adopted without division.

The weather in Ireland threatens the utter destruction of what promised to be one of the finest harvests ever reaped there. The heavy and almost incessant rain has laid low many flourishing fields. Potatoes have been seriously injured.

The body of the Scotch Earl of Crawford and Balcarres, which was stolen some months ago from the family vault at Danecht House, Aberdeenshire, was found, on Tuesday, in the grounds of the House. A man suspected of connection with the theft has been arrested.

An explosion of gas occurred on the Rue Louis Philippe, Paris, during a fire on Wednesday, by which twelve houses were destroyed, twenty persons killed, forty injured, and one hundred rendered homeless.

In Paris, on Thursday night, the new Hôtel de Ville was inaugurated with a grand banquet, which President Grévy attended. The old City Hall was destroyed by the Communists in 1871.

The Fête of the Bastille was celebrated in Paris and throughout France on Friday.

An epidemic of cholera has broken out at Hong Kong.

THE RIGHT AND WRONG OF THE EGYPTIAN QUESTION.

THE concern of the Egyptian people in the conflict between Great Britain and Arabi Bey and his mutinous troops, which has ended so disastrously at Alexandria, is after all the main point of interest for foreign bystanders. If Arabi had been heading a revolt of the taxpayers against being compelled by foreign force to pay an enormous debt to foreign money-lenders, contracted by a reckless, extravagant, and dethroned prince, the sympathies of the civilized world would have undoubtedly been his due. There is no warrant, either in international law or in sound policy, for going to war to compel governments, and especially despotic governments, to repay money borrowed from foreign speculators. All civilized governments have, at one time or another, either expressly or by implication, repudiated the notion that any man who chooses to invest in the public debt of a foreign country has a right to call on his government to enforce payment either of his principal or his interest. And it would be very bad policy indeed for any government to hold out to investors and money-dealers the hope of any such aid, for it would destroy all caution on their part in dealing with weak or semi-barbarous powers. It would furnish speculators with a kind of security they ought not to have, and cannot have without gross injustice to those who live by their own industry. To tax the latter for a war waged to extricate the former from ventures which they must have known were risky when they engaged in them, would be great injustice.

It is safe to say, too, that if there ever was a body to which the maxim *caveat emptor* ought to apply, it is the foreign holders of the bonds issued by the late Khedive. Any one who bought them without perceiving the gulf to which Ismaïl's extravagance was leading, richly deserved to lose his money. Any one who perceived it, but bought them just the same, deserved it still more richly. Consequently, if the interference of France and England with Egyptian finances was simply an attempt to save foreign bondholders from loss, and if the enforcement of their claims was visibly increasing the burdens of the unfortunate Egyptian taxpayer, there would be nothing to be said for it. In fact, as a movement, even in form, for their protection, there is little to be said for it.

But, fortunately, there is not the smallest foundation for the belief that it has made any difference for the worse to the taxpayer. There is not the smallest reason for believing that Ismaïl's foreign loans have had any influence in increasing the peasants' burdens. The rule of native Egyptian, as of all Mussulman finance, is very simple: it is to take everything visible the taxpayer has got beyond a bare livelihood. In Egypt, owing to the gentle, uncomplaining character of the fellah and the wonderful fertility of the soil, it has long been the custom to apply more pressure than is usual in Oriental countries. Before the establishment of the European Control not only did the amount of the taxes depend largely on the caprice of the collector, but the fellah was flogged to make him pay. If there had been no foreign debt and no European Control, he would have been taxed and flogged just the same. There is no bottom to the maw of an Oriental court. The truth is, the European Control greatly improved his condition by making the amount of the taxes certain, by stopping torture in the collection, reducing the theft and corruption in the financial administration, and introducing a proper system of accountability.

This must be borne in mind, after admitting all that can be said against any foreign interference on behalf of foreign creditors, and against the undoubted impropriety of foisting on the Khedive, as the Control did, a large band of very highly-paid European officials. In fact, whatever may be said for Arabi's revolt, it cannot be said that it was in any sense an attempt at political revolution on behalf of the people. In so far as it was political at all, and not a mere military mutiny, it was a rising of office-holders who found themselves cut off from their usual "divvies" out of the huge corruption fund which the revenues of every Mussulman country compose. The feelings which animated him and his confederates were precisely those which would animate the Pashas at Constantinople if the receipt and disbursement of the taxes were taken out of their hands. They would grumble and curse, and declaim about "national independence," and, if they dared, would revolt, massacre, and pillage.

Behind the financial question there is, however, as far as England and France are concerned, a much weightier one, on the moral bearings of which it would be impossible to pass without going much further back than it is possible to go in a world in which life is so short, and all interests, individual as well as national, so complicated. An orderly and tranquil Egypt has become a political necessity to England, on account of the Canal. It has become a necessity to France on account of Algiers, and we do not think we are too charitable when we say that it was the desire of securing this which led them to overlook the obvious and well-settled objections to interference on behalf of foreign creditors. A return of the turbulent old Egypt, ruled by a succession of military adventurers, rent by *émeutes*, massacres, and civil wars, and fanaticized by dervishes and "false prophets," is something to which we cannot ask them to submit without asking them also to cease caring, the one for her empire in India, and the other for her empire in Africa. To ask this is to engage in what is called an "academic discussion," which, however profitable it may be for moralists and speculators, is not the business of statesmen. We are the less disposed to ask it, too, at the moment when Europe, after six hundred years of horrors, has plainly begun to roll back the tide of Mussulman barbarism, which has converted so many of the fairest lands on the globe into wastes which no civilized man ever traverses without shame and indignation. In dealing with Mussulman patriots and statesmen, too, they are dealing with savages like Arabi Bey, who, after amusing Western sympathizers with the jargon of transcendental politics, which they have acquired to perfection, are ready to slaughter a village full of women and children, as at Batak, in Bulgaria, or fire a great city and let cutthroats loose on the flying householders, as at Alexandria.

SAGES.

THE attempts made to explain the meaning of Mr. Conkling's speech at Utica are natural, but at the same time unsatisfactory. The *Herald's* Washington correspondent declares that in Washington, where the matter has been most carefully considered, his friends think that it means that he is going to run for Congress, and that the speech is a "back-handed blow" at the Republican party. This must mean that he is going to run either as a Democrat or as a Half-Breed, for he is not the man to deal back-handed blows at the party from which he expects the nomination; but the idea of Mr. Conkling going to Washington as a Judas is so painful that almost any other plausible explanation ought to be readily accepted by his friends.

We, therefore, venture to suggest that the true explanation of Mr. Conkling's speech is not that he is going to come out as a Judas, but that he is merely going to set up as a Sage. That there is an opening for a Sage in the party, and that he may really do the party much good, is evident to any one who will reflect for a moment on the origin and functions of Sages. The idea of the Sage in politics at present suggests to the mind a venerable man, who has had a long and active political career, but has retired to domestic life, and is spending his declining years in watching the struggles over the primaries and conventions which he no longer tries to fix, the slates that others must make up without help from him, and the platforms which younger and more energetic men must render as meaningless as he and his friends did the platforms of his day. He occasionally holds forth to the younger men, giving them his ideas on the progress of events and the probable future course of politics, and he is always listened to with great respect and attention, and his speech or interview is published in all the newspapers, and the announcement generally made, too, that the Sage is going to run either for Congress, for Governor, or the Presidency, which the Sage, however, never does. We have in this State, for example, three well-known Sages—Mr. Tilden, Mr. Weed, and Mr. Seymour. The South has its Sages in Jeff. Davis and Alexander H. Stephens. The belief that Mr. Tilden will return to public life is so deep rooted that not even the repeated admission by his friends that he is incapacitated by old age from anything of the sort, or as his enemies put it, that he is a "mummy," can prevent the chances of his nomination for high political office being canvassed every year or two. Mr. Seymour's plea of physical incapacity has scarcely relieved him from the danger of being forced into public life; and nothing short of two or three paralytic strokes or dementia can really be considered as guaranteeing a Sage against this sort of interference with his chosen occupation.

When we say that Mr. Conkling's speech shows that he wishes to become a Sage, we judge from internal as well as external evidence. A Sage's speech usually consists of three parts: in the first he dwells upon the great pleasure it gives every politician who has devoted himself to public life, far from the congenial scenes of his childhood and youth, to get back among his friends and acquaintances, and see the old familiar faces and grasp the honest old hands once more. Then he goes into some general consideration of the condition of the country and of parties, showing that progress is being made all the time, and that there is reason to look forward to the future with the cheerful anticipations that have been warranted by the experience of the past. The Sage is always something of a reformer, but by no means a doctrinaire or a theorist. He does not believe in any particular reform, but in a sort of great political law of progress, which carries the country on to a higher and higher pitch of prosperity every year, without the need of any individual effort at improvement or any noisy struggle. In the third place, the Sage, if he understands his business, turns to consider the dangers to which the country is exposed, and these he always finds consist in the habit of spending too much money. He therefore recommends frugality and economy, and usually congratulates his hearers that they at least are prudent and saving, however wasteful others may be. All these marks of the Sage we find in Mr. Conkling's speech. For twenty-two years, he said, he had been banished from Oneida County, but at last he had got back—got home, got back to Utica—and, as Mr. Conkling feelingly said, there is no place like home. "Time, with his frosty fingers, has silvered many a brow, and the turf and the snows have hidden all but the memory of many a friend who once bravely and gayly trod with us the pathway of life," but the survivors "come with a warm welcome to a private citizen having no claim on your regard, except his warm and abiding attachment to your interests and your homes; except his attachment to our beautiful city, and to the neighbors and friends to whom for long, long years he has owed so much. Under these circumstances, you will let me believe, without other thought, that your presence here means the personal kindness of valued neighbors and valued friends. It could mean nothing which would be prized so much, nothing which could be held in memory so long and so pleasantly."

After this comes the allusion to the country, which has attracted such widespread attention: "The old party issues have largely passed away—passed away, at least, as dividing party lines. We are in a period of peace and great prosperity, but let us not forget that prosperity often tests and tries the wisdom of nations and of men more even than adversity."

Then we have the warning voice raised on the subject of economy: "The tendency is to spending largely, the tendency in Government is to profuse, perhaps lavish, appropriations of the public money. In the affairs of Government, and in the affairs of business, unless I greatly mistake, the lesson, the need, and the admonition of the hour is frugality, foresight, and care. We have more need of the brake than of steam in a good many ways just now." For Utica, however, the danger is less, because "Utica, I am glad to know, is prudently planning and saving up her sons' capital, energy, enterprise. Utica capital is building homes for labor and planting fields for labor here, going not so much as formerly for investment and for speculation far away. All this is well." This was the whole of the speech, and if these are not the words and thoughts of a Sage, and if they have not all been uttered before now by Samuel J. Tilden, Horatio Seymour, Thurlow Weed, Jefferson Davis, Alexander H. Stephens, and their fellow-Sages, not once but on many occasions, we are very much mistaken.

It is all the more meritorious in a Republican to become a Sage because it is not so easy as for a Democrat. The Democrats have inherited a great stock of gnomic wisdom from the "earlier and purer days" of the country relating to such matters as centralization, the three departments of government, "each independent within its own sphere," and the necessity of government being divorced from connection with private business, which Republicans care little or nothing about, and in which the history of the party prevents their taking much interest. This fact would probably make it very hard for many of the most eminent Republican leaders on retiring from politics to set up as Sages, much as they may some day like to do so. It is impossible to imagine Mr. Blaine as a Sage, or Mr. Robeson, or Senator Logan. It needs a man who has been generally looked upon not merely as a brilliant orator or dashing administrator, but as one accustomed to the expression of what is believed in political circles to be thought. Nothing the younger politician so admires in an older one as thought, provided it does not interfere with his regular pursuits, and the character in politics he most reveres is consequently the Sage. The Sage need not be a good man—neither Jefferson Davis, nor Mr. Tilden, nor Thurlow Weed is believed to be perfectly good; but he must be a deeply thoughtful man, and that Mr. Conkling should now in his retirement be preparing to think is a most significant fact. That no Sage should be able to do this without having it generally believed that he must be going to run for office, is one of the risks of the occupation which the true Sage cannot avoid, though it must sadden him.

THE SUSPENSION OF THE PARNELLITES.

LONDON, July 6, 1882.

THE Parliamentary crisis which had been for some time expected has just come, and for the moment passed. History never exactly repeats itself, and the circumstances of this obstruction and suspension have differed in several material points from those of the winter of 1881. On that occasion the Irish Opposition, numbering between thirty and forty members, had resisted the introduction of the Person and Property Protection Act by obstruction which was not only systematic, but open and undisguised, consisting in repeated motions for adjournment, on each of which every member spoke at the greatest possible length. This course was peremptorily stopped, after a sitting of two days and two nights, by the Speaker's interposing and putting the question. Next day, men's minds being much excited both by this event and by the arrest of Mr. Davitt, the Parnellite party disobeyed the authority of the Chair, and were suspended one after another for so doing. This time the tactics of the Irish section have been more discreet. In resisting the progress through Committee of the Prevention of Crime Bill they have not used dilatory motions, but occupied themselves with devising an endless string of amendments, and discussing each of these at very great length. Of course such discussion necessarily involved a good deal of irrelevancy and repetition, but the subject is a wide one—everything relating to the condition of Ireland could, with a little skill, be dragged in and made to appear pertinent; and though a speaker may be called to order for wandering, or perhaps even for a wearisome iteration of what he has said before, a following speaker commits no breach of order when he repeats what his predecessor has said. The impatience and irritation of the English members continued to increase, not merely because they were tired of listening to dull and seemingly purposeless debates, but also because every now and then some terrible murder was reported from Ireland, with the invariable addition, "No clew to the perpetrators." This sense of double helplessness—helplessness in the presence of obstruction at Westminster, helplessness in the presence of crime in Ireland—worked on the passions of the English members till most of them became ready for anything which would break the toils in which they found themselves caught. The announcement that an all-night sitting would be held was welcomed as a sign that the end was near, and it was, as you know, on the morning after that all-night sitting that the Chairman of Committees, Dr. Lyon Playfair, reported sixteen members as guilty of obstruction, and in the evening of the same day nine members more, the persons reported being in both cases suspended forthwith, by a vote of the Committee and of the House, for the remainder of the sitting.

The details of the "scene," as the newspapers call it, you have probably read altogether. They were much less dramatic than those of last session, and have made a less profound impression in the country. That is naturally the case when a thing has happened before; it is an unfortunate result of these irregular and violent remedies for evils grown intolerable, that the remedy seems on every fresh occasion less irregular, and is resorted to more readily and lightly. No example could show more clearly the dangers of that excessive regard for established forms and unwillingness to reform them in proper time which has often been remarked among Englishmen. For the last ten years or so the defects of our Parliamentary procedure have become gross and patent, yet it has been found impossible until now to get them adequately dealt with. The consequence is that when systematic obstruction is resorted to, and public affairs become serious, extreme and exceptional measures have to be taken to overcome it, the adoption of which gives a far greater blow to the traditional respect for Parliament and its usages than a gentler cure, earlier applied, would have done. This has befallen us. We have had what critics call our second Parliamentary *coup d'état*. It has been received with less surprise, and less regret that it should have been necessary, than the first one, and a third will be still easier and still more probable. Another disagreeable result is the great bitterness which crises like this stir up in men's minds. The English members, including a large majority of Liberal as well as Tory members, had grown so angry and impa-

tient that when the explosion came, and they found themselves able to crush their opponents, they could hardly control themselves, and have not been since in any mood to listen fairly and calmly to argument. The clauses of the bill which remained to be discussed when the Irish members were suspended on July 1, were of secondary importance; the two sittings allotted to them were amply sufficient to dispose of them. But had they contained the most serious provisions, it would have been easy for the Government, had it so willed, to hurry them through a passionate House, which called only for swift action.

To prevent a recurrence of obstruction, and enable the remaining stages of the bill to be promptly despatched, the Government revived what are called the "urgency resolutions" of last session, by which the Speaker is armed with almost dictatorial powers for expediting business and closing discussion. They had often been asked to do so earlier, but feared that the Irish Opposition would consume as much time in discussing whether urgency should be granted as the passing of the bill itself would require. And this would no doubt have been the case but for the suspension of the twenty-five members, which showed Mr. Parnell's friends that such stringent measures might be taken as would render resistance hopeless. Accordingly, when urgency had been voted, most of them retired, announcing that they would take no further part in the debates on the bill. The ground alleged for this was the manner of the suspension, which is objected to as being an unfair and unexpected extension of the rule which permits the Speaker or Chairman to name a member guilty of obstruction. Here some of the persons named were not present, and had not been present for some hours; they had, therefore, no opportunity of defending themselves, and as the offence was past, they might have supposed it had been overlooked. The action of the Chairman is, therefore, impeached, and several notices have been given to have it condemned by the House—notices, however, for which time for discussion is not likely to be found. In defence of the Chairman, it is alleged that what he named and was entitled to name the offenders for, was not so much obstructing at any given moment as participation in a conspiracy to obstruct—a conspiracy whose purposes might be carried out equally well while some were absent taking rest and preparing themselves to return and support the others. Such an act, it is urged, is really worse than the isolated obstruction of a particular member. Is it to go unpunished? or is it to be punishable only when each member is caught in fulfilling his own part of the work, not at any time when the existence of the conspiracy has become apparent? Whatever conclusion public opinion may form, there is of course too strong a tendency to support the Chairman to make any direct censure on him possible. His task during these two months has been a very arduous and exhausting one, and has sometimes appeared likely to prove too much for his physical strength. Even, therefore, if he had not shown great fairness and courtesy in the general discharge of his duties, there would be a disposition to stand by him.

The conduct of the Irish Nationalist members through this long battle has been much blamed, and has no doubt increased the bitterness between the countries and the difficulty of establishing a *modus vivendi*. But Englishmen, as is natural, do not quite realize the difficulties in which these members were placed. A bill was brought in which, though no doubt aimed only at criminals, did subject ordinary citizens to some—perhaps unavoidable—restrictions. It was, no doubt, an indignity to Ireland that it should be proposed, even if an indignity which the increase of undiscovered crime rendered necessary. If the Parnellite members were to retain their hold on their constituents, they must oppose it, and oppose it strenuously and untiringly. This the opinion of their own friends in Ireland demanded, and they had to choose between offending those friends, and being assailed as cowards or traitors, and irritating English members and incurring some Parliamentary penalties. Of course, they chose the latter alternative. But it may be asked whether they need have gone so far; whether it was necessary to carry resolute opposition into obstruction; whether, in defending what they think the national cause, they need have made so many personal attacks on English officials, and shown so constant a desire to insult England and all that belongs to her. They hold such behavior to be good policy, as hastening the creation of a separate Parliament for Ireland, but do not reflect that by making the English think that such a Parliament would be a wild and dangerous body they also impede their own plans. Be this as it may, any one can see how easily those who resolve to fight hard end by thinking every weapon and engine of warfare legitimate; and, after all, that is what their constituents expect from them. Y.

ENGLISH NEWSPAPERS ON INTERVENTION IN EGYPT.

LONDON, July 6, 1882.

THE existing state of journalistic opinion in England is so far an essential factor among the elements of the Egyptian question, on the eve of active European intervention, that it is worth while estimating it with some precision. At the present time there is a remarkable *consensus* of opinion among the leading journals, both Liberal and Conservative, though there are one or two noticeable exceptions. Even the *Times* is not out of harmony with its penny contemporaries, though it does its best, as usual, to preserve its balance of mind and not to commit itself too far for retracing its steps. The Liberal *Daily News*, the most conspicuous supporter of Mr. Gladstone's Government, after much vacillation, seems finally to have taken its side strongly against English intervention in any case; but its Egyptian correspondents all point in the other direction, and its articles on Egypt are just now little better than a cento of worn-out truisms on non-interference with patriotic movements in other countries. No attention is paid to the special facts and history of the case, or even to the evidence of the journal's own correspondents, who have demonstrated over and over again the imposture of the so-called "national movement." There is no paper of repute, on either side in politics, which writes with equal ignorance and weakness on this subject

The *Pall Mall Gazette* and the *Spectator* are the Liberal organs which take the broadest and most intelligent views of Egyptian affairs, and of the proper attitude of England toward them. The *Spectator*, indeed, has for a long time past, and long before the present revolution in Egypt, consistently adhered to the view that England has a peculiar relation to Egypt which calls for and justifies its overwhelming political preponderance in that country. The *Pall Mall Gazette* has recently been engaged in a controversy with Mr. Frederic Harrison, who has made himself the mouthpiece of a society calling itself the "Anti-Aggression League," and which has adopted a most uncompromisingly pacific policy in reference to Egypt. The *Pall Mall Gazette*, as edited by Mr. John Morley, is a strong supporter of Mr. Gladstone's Government, and, in fact, the disruption which generated its rival, the *St. James's Gazette*, was brought about by differences of opinion in respect to Lord Beaconsfield's energetic foreign policy. Nevertheless, the practical conclusions of the *Pall Mall* and the *St. James's Gazettes* in favor of active intervention in Egypt are now identically the same, though, of course, supported by opposite classes of arguments.

It is indeed important to notice the very different considerations urged in the Liberal and in the Conservative journals which combine to support English intervention in Egypt. Conservative writers dwell most prominently on the imperilled honor and dignity of England; on the importance of the Suez Canal; on the traditional policy of the country; and, with some hesitation, on the claims of the bondholders. Of course they say nothing openly about annexing the country, and scarcely venture to hint even at temporary occupation. But their antecedents in Afghanistan and at the Cape have so discredited them in the constituencies that their Egyptian policy is looked upon somewhat askance. Nevertheless, they are doing their best, with Lord Salisbury's help, to turn the occasion to party account. They are holding rousing patriotic meetings, with the view, as they say, of "supporting" the Government, and, of course, without any party aims. Indeed, they deprecate the suggestion of making such a topic a party question. But Lord Salisbury and his friends lose no opportunity of reminding the Government of their "pledges," and "guarantees," and notes, and despatches, and of watching over the fulfilment of engagements with the most friendly, not to say officious, vigilance.

The more intelligent Liberal writers no doubt find themselves in considerable difficulties. The Liberals, with Mr. Gladstone at their head, turned out their predecessors, led by Lord Beaconsfield, on the question of non-annexation and non-aggression. No act of Lord Beaconsfield's Government was more severely commented upon and condemned in Liberal circles than the movement of Indian troops to Malta in order to bring pressure to bear on the enemies of Turkey. Indeed, it is said to have been on the very question of the proposed annexation of Egypt that Lord Beaconsfield's Ministry was, at one juncture in the Anglo-Turkish war, nearly breaking up. It now unluckily happens that the form to which all political and diplomatic events connected with Egypt tend is that of a European occupation mainly conducted by England. It is true, the English Government can establish by incontestable proofs that they have labored in season and out of season to come to terms with France in order to agree on a conjoint active policy; that they have encountered the evils and risk of any amount of delay for the purpose of bringing about active and effectual Turkish intervention; that they have exhausted the resources of diplomacy and international concert in the endeavor to have as many partners as possible in their enterprise; and that only when they found no one else willing and competent, they addressed themselves to the task of restoring and securing order in Egypt. This is all true, but it unfortunately takes much longer saying than repeating the commonplaces that all intervention is wrong, that nations should be left to govern themselves, that England should never have mixed itself up with Egypt, and that if Englishmen choose to live in Egypt, they must take what they get. But these commonplaces do not touch the Suez Canal problem, nor do they harmonize with the recognized Liberal policy of gradually cutting short the Turkish Empire and preventing any

province, which, like Egypt, has once escaped from the mire, ever wallowing in it again.

A.

FIFTY YEARS OF REFORM IN ENGLAND.

LONDON, June 29, 1882.

ON the 8th day of June, 1832, the great Reform Bill became the law of the land. Fifty years have passed since that date. We can now, therefore, form a fair judgment of the working and results of a measure which in the eyes both of its advocates and of its opponents constituted a turning-point in the history of England. Looking back from the vantage ground of half a century, we can see many things which were concealed from the view of the combatants in the great Parliamentary battle. The retrospect is curious. It is full of historical interest, but it also affords instruction quite as valuable for Americans as for Englishmen.

One point becomes to a candid observer as clear as day. The policy of 1832 has been as fully justified by its results as can be any act of statesmanship. The Whig leaders proved right both in their assertions and in their denials. They asserted that the reform of Parliament, the abolition of rotten boroughs, the making the representation of the people a reality, was to strike at the root of the evils from which England suffered. They based this assertion on their conviction that "reform" would afford the means and be the cause of every kind of political and social improvement. Who cares now to deny that this assertion was true, both in spirit and in letter? The emancipation of the West Indian slaves, the Factory Acts, the amendment of the Poor Law, the reform of municipal corporations, the mitigation of the criminal code, the foundation of a system of national education, the repeal of the Corn Laws—these and a host of minor improvements, such as the establishment of the penny post or the abolition of the press-gang, were all the more or less direct fruits of Parliamentary reform. But the indirect consequences of the change which identified the sentiment of Parliament with the sentiment of the bulk of the nation have been even greater, though less immediately notable than its obvious results. The policy of 1832 was at bottom a policy of conciliation. From that date to the present day English statesmanship has seriously attempted to reconcile every class of the nation by obliterating the distinctions or divisions caused by unjust or impolitic legislation. Churchmen and Dissenters, Protestants and Catholics, manufacturers and artisans, the Church and the people, have drawn nearer and nearer to one another, partly through the destruction of the legal barriers of privilege by which they were divided, partly through the spread of sentiments which were, so to speak, hemmed in by walls of legal and social difference. The work is not complete, it will not be completed for years. But no one who is not a confirmed pessimist can deny that a policy of justice, of humanity, and of sympathy has assuaged the bitter passions of class hatred which, by the universal testimony of persons belonging to every kind of religious or political school, distracted English society from, say, 1815 to 1850.

On this point I have dwelt before in my letters, and shall dwell again. Nothing appears to me to be of greater consequence than to realize the good effects produced in England by half a century of beneficent legislation. The Whigs were right in asserting that Parliamentary reform would be the source of improvement and prosperity. They were right also in denying that reform meant revolution. On this point the present generation hardly does justice either to the wisdom of Whig statesmanship, or to the apparent justification for the fears of Tories who believed that 1832 would be to England what 1789 was to France—the beginning of an era of violence, of revolution, and ultimately of tyranny. Wellington, Canning, Peel, and hundreds of their now forgotten followers were men of parts and of courage. Their anticipations of disaster were based on the apparent lessons of history. The Tories of 1832 could many of them recollect the great French Revolution; they all of them had come to manhood during a period of reaction; they all of them had before their minds pictures of the Reign of Terror and of the despotism to which democratic violence gave birth. Lord Grey, Lord Althorp, and Lord John Russell were honorable men; but so were the Constitutionalists who hailed with delight the assembly of the States-General. When Bristol was in the hands of a mob, when Nottingham Castle was wrecked by the populace, when even moderate men talked about Hampden and the duty of refusing to pay the taxes, when the bull ring at Birmingham was crammed with hundreds of excited artisans who cheered Lord John Russell's denunciation of that "whisper of a faction" which ought to be overpowered by the voice of the nation, who can wonder that not only fanatics of Toryism like Wetherell and Croker, but calm administrators such as Wellington and Peel, believed that the "reformed Parliament" would herald in the rule of an English "Convention" doomed to inflict on the country all the horrors and calamities of a revolutionary era?

The Tories of 1832 were mistaken. Their error was natural. It is worth while to see wherein it consisted. Their mistake was, as we now can perceive, threefold. They underrated the self-control, the common sense, the political sagacity of their countrymen; they forgot the essential difference between Englishmen trained to public life by centuries of freedom and Frenchmen who knew so little of real politics as to take Rousseau and Plutarch for authorities in matters of government. They overrated the extent of popular discontent and disaffection. As experience proved, no class of Englishmen hated the existing state of society with half the intensity with which every class of Frenchmen detested the *ancien régime*. The Tories of 1832, lastly, underrated their own self-control and good sense. Under Peel's guidance, Toryism was transformed into Conservatism, and revolution was arrested because there was not even a beginning of reaction. Peel opposed reform, but Peel was indirectly at least as truly the author of the success which followed reform as he was of that policy of Catholic emancipation or of free trade for which he has, in popular tradition, received a credit that far more truly belongs in the one case to O'Connell and in the other to Cobden. When Peel announced that the Conservatives accepted the Reform Act, when Lord Russell had the wisdom to proclaim the "finality" for the moment of the change made in the constitution of Parliament, the policy of the Whigs received its real justification. By one of those odd turns of fate with which history is filled, the party which carried reform lost popularity from the very minute when reform triumphed, and this loss of popularity was, as we can now see, the surest proof that the policy of reform was sound. The wants of England had been met and satisfied, and the country, wishing neither for revolution nor for reaction, turned of necessity to the one consummate administrator who could make Parliament an instrument of good government. Peel was, in more respects than one, the agent who carried into effect the policy of the men whom he nominally opposed. If any one says, as some Conservative writers are inclined now to say, that the success of the Reform Act was due quite as much to the moderation and temper of the Conservatives as to the energy of the Whigs, he says what in one sense is true; but those who credit the Tories of 1832 with the success of a measure opposed by every Tory from Wellington downward, must in fairness remember that the Whigs who predicted the success of reform ought to be credited with knowledge of the temper which the Tories were in the long run likely to show. To know, or rather to feel, that English noblemen would never fall into the mistakes of French *émigrés*, that Peel and his followers would never be disloyal to the Constitution established by law, was to perceive one of the most essential facts of the situation. If the Tories had as a body followed Eldon, Lyndhurst, or Croker along the path of reaction, reform might, it is likely enough, have ended in a revolutionary catastrophe.

The policy of 1832 has, in spite or perhaps because of its brilliant success, been the constant mark of severe criticism. It is worth while to examine with care the nature and worth of the most obvious objections brought against the Reform Bill.

Reform, it is alleged, has excluded from Parliament every man of genius who is not also a man of wealth or rank. The measure which improved the representative character of the House has lowered its intellectual ability. The elder Pitt, Burke, Canning, Macaulay, or Praed would not now find the field for his political talents. The large constituencies prefer tried politicians or local magnates, and have neither the wish nor the discrimination to encourage or patronize youthful genius. The facts alleged by the critics of reform are, I think, in the main true. I say "in the main," because it is not yet proved that a young man of great talents may not, even without wealth or political connections, win a seat in Parliament if he devotes himself to a political career with the same energy with which his friends labor for success at the bar or in literature. There is every reason to suppose that men like Mr. John Morley and Mr. Frederic Harrison, might, if they chose to give all their talents to politics, find constituencies capable of perceiving how valuable these talents might be to the popular cause. Professor Bryce's election for a London constituency outweighs a hundred lamentations over the alleged incapacity of artisans or shopkeepers to recognize character and ability. I may further add that ordinary electors are much less exacting than were the old patrons of boroughs. It was considered a matter of honor that a member who voted against the wishes of his patron should at once apply for the Chiltern Hundreds. All England would be indignant if the Birmingham Caucus (for which, I admit, I entertain no great admiration) were to imitate the noblemen who during the last century exacted from their nominees obedience to a "mandate" quite as "imperative" as any issued by French Democratic electors. The plain truth is, that if the system of rotten boroughs occasionally placed a young man of genius in Parliament, it gave him a seat on terms which made his presence in the House of Commons a doubtful benefit to the nation. Burke was the dependent of Lord Rockingham, and probably never wrote or spoke with perfect freedom until he ceased to sit in Parliament. Macaulay was of too robust a character to be dependent on any man, but he held his seat when he first entered the House at the will of Lord Lansdowne. Moreover, for one man of genius sent into Parliament by an enlightened patron to serve the public, we may safely reckon that there were ten who were nominated by the owner of a borough because they were fit tools to do his dirty work. Lord Shelburne was a

man of enlightenment. There was no person for whom he had a more genuine admiration than for Bentham; yet, though his lordship had four seats in his pocket, he could not spare one for the man of genius whom he himself termed the "Newton of legislation."

Moreover, the state of things which led the owners of boroughs to pick out youths of talent who were ready to serve as the rhetorical gladiators of a faction in the party conflict of the day, was, it may be suspected, in itself transitory. There were signs before 1832 that the rotten boroughs were becoming the property of rich men who used Parliamentary influence to promote mercantile speculations. The critics who look with regret on indefensible anomalies which occasionally produce some slight amount of practical advantage, always assume that a bad system would not, as time went on, have grown worse. No assumption is more baseless. Evil produces evil, corruption is the parent of corruption. If the unreformed Parliament could by any miracle have been kept unreformed up to the present day, we may be quite sure that the House of Commons of 1882 would have exhibited all the vices of the House of 1832 in an exaggerated and fully-developed form. The rotten boroughs would long ago have become the property of companies or of promoters. We know well enough what are the uses to which the votes of members who owed their seats to the chairman of a railway company would have been put. We may console ourselves for the possible loss which may be incurred through some unknown Burke being compelled to write for the press instead of addressing the House of Commons, by the reflection that we have escaped, at any rate to a certain extent, the risk of seeing the House crammed by men who represent nothing but the wishes of stock-jobbers or of directors. Even as it is, the influence of the money market on Parliament is fully as strong as is consistent with the interests of the public.

Under the working of the Reform Act, everything, it is sometimes said, has improved except English statesmanship. Our leading men lack the nerve, the decision, the courage of their fathers. Lord Palmerston was the last of the body of manly and stalwart statesmen nourished under the system which the Reform Act abolished. The statement is too vague to be very satisfactorily dealt with by argument. I am inclined myself to hold that it does contain an element, though a very slight element, of truth. Increase of knowledge, the general diffusion of sympathy, the democratic and humanitarian spirit of the age, lead in the affairs of public life sometimes to the reality and much more often to the appearance of weakness. Pitt carried through the Act of Union with a vigor which would hardly be exhibited by Mr. Gladstone or Sir Stafford Northcote. He was hampered by no squeamish scruples as to the mode in which he obtained a majority in the Irish Parliament. He did not perceive all the evil certain to result from defying popular opinion: he carried his measure. We now know that the mode in which the Union was achieved deprived an act in itself of sound policy of nearly all the benefits for the sake of which it was carried by a Parliamentary *coup d'état*. Vigor without knowledge has a fine appearance, but it generally leads to results at least as bad as those produced by humanity without strength. Grant, however, that the politicians of 1800 possessed qualities, good no less than bad, not to be found in their descendants. This concession goes but a very little way in condemnation of the Reform Act. The amendment in any system of representation can, of its very nature, accomplish at the best but one object. It may bring parliament into harmony with the nation; it may to a certain extent facilitate the approach of men of genius to the service of the state; it may, in short, create a representative assembly which represents the feelings and the talents of the nation. No assembly—we may fairly say no government whatever—can by any device known to man rise much above the moral and intellectual level of the people from whom it springs. This general truth is specially true of representative government. A nation full of dishonesty, of incapacity, of lawlessness, cannot form a representative assembly filled with all human virtues. A people of knaves or cowards will assuredly elect a parliament of rogues and poltroons. The best that can be hoped for from constitutional mechanism is that it shall produce parliaments of members not markedly inferior to their electors.

The question to be asked with reference to the Reform Act is, not whether the *morale* of English statesmen has or has not changed during the last half century, but whether the House of Commons has fairly reproduced the virtues no less than the vices of the country. The answer cannot be doubtful. The humanity, the moderation, the general spirit of fairness which have on the whole characterized the last two generations of Englishmen, have in the main also characterized the English Parliaments which have sat since 1832. If these Parliaments lack something to be found in the unreformed House of Commons—and the truth of this hypothesis is by no means made out—the want arises not from the constitution of the electorate, but from the state of the English nation, or rather of that wider world of which England is after all but a part. I am no special admirer of our own time; the age has its fair share of special vices connected with two general phenomena of which I trust to write to you on some future occasion—namely, unlimited freedom of discussion and the gradual disintegration of beliefs. But to lay these faults to the charge of reform is scarcely less absurd than to attribute them to the rule of a Queen. In 1830 France reformed herself after her manner by the "three glorious days" of barricades. In 1832 England began to put her house in order by passing the Reform Act. Is it France or England which took the true path of permanent progress? Few of your readers will hesitate to affirm with me that the "glorious days" were at best but a generous error, while the Reform Act was a prudent step toward infinite improvement. If this be so, the act and its authors need no further apology against the attacks of critical ingenuity.

A. V. Dicey.

Correspondence.

LANDING OF THE PILGRIMS.

To the Editor of The Nation:

Sir: We of the old colony feel much honored, I am sure, that your journal should devote so much attention to the discussion of the true landing date of the Pilgrims at Plymouth. But we have some objections to urge to the view which you take. If I correctly understand the object of your elaborate editorial discussion of the subject on Thursday last, it is threefold—viz., to prove (1) that the design of the celebration of the 22d December has always been to commemorate the landing of the colonists from the *Mayflower*, and not from the shallop; (2) that that landing took place on the 22d December, old style; and (3) that in honor thereof the celebration has always taken place on the 22d December, *new style*.

You will pardon us, I hope, that we do not all of us see at once the harmony of these propositions, if true; while, as we doubt their truth, we hope your charity will be extended at least long enough to look candidly at the evidence to be presented on the other side.

1. Some of us deny that any landing took place from the *Mayflower* on the 22d December, old style. It so happens that, while a great deal of uncertainty surrounds the exact dates of the early events of the colony, no uncertainty at all attaches to those of that particular date; but there is, on the other hand, the most absolute certainty that no landing whatever then took place. Of course it is not necessary to inform the *Nation* that but two original authorities exist giving testimony upon the matter in question—viz., Bradford's 'Journal' (first printed in 1856), and what is commonly called Mourt's 'Relation' (1622), which in this part was really written also by Bradford. Nathaniel Morton, in his 'Memorial' (1669), and Prince in his 'Annals' (1736), made use of both; but even the latter omitted much, while no subsequent writer has so much as pretended to offer original testimony as to the subject. Bradford is, therefore, the sole witness. And what says he? In the 'History' he condenses so much as to say nothing at all on this point. But in the 'Relation,' after stating in detail that they arrived in Plymouth Harbor with the ship on Saturday, 16th December (of course all his dates are in old style); that on the 18th (Monday) an expedition "went a-land," and, after exploring all day, "went abourde againe" at night; that the party explored again on the 19th (Tuesday), and that on the 20th (Wednesday) they went ashore again, and, after careful examination of all the good spots they had seen, concluded, "by most voyces," to settle "on the maine land, on the first place, on an high ground" (Burial Hill and parts adjacent), where a part encamped, and the rest returned to the ship, intending all (who could work) to go ashore the next morning, he thus proceeds (p. 23)—viz.:

"The next morning being Thursday the 21. of December, it was stormie and wett, that we could not goe ashore, and those that [had] remained there [on shore] all night could doe nothing, but were wet, not having dai-light enough to make them a sufficient court of gard, to keep them dry. All that night it blew and rayned extreamely; it was so tempestuous that the Shallop could not goe on land so soone as was meet, for they had no victuals on land. About 11. a Clocke the shallop went off with much adoe with provision, but could not returne it blew so strong, and was such foul weather, that we were forced to let fall our Anchor, and ride with three Anchors an head."

Now please to notice what Bradford, at the time and on the spot, wrote as to the day when the *Nation* assures us that the whole *Mayflower* company landed on the rock:

"Friday the 22. the storme still continued, that we could not get a-land, nor they come to vs aboord."

Surely this is proof enough that, whenever the landing from the ship—if there were any—did occur, it was not on this day.

2. But, further, some of us deny that there ever was any "landing"—in the sense here put upon the word—from the *Mayflower* in the harbor of Plymouth. Without asking space here to establish it by citations, I hold myself ready to prove that what actually took place was this—viz.: that, as has been seen from citations already made, parties went from the ship on land to explore and to labor—after the first two days, a portion passing the nights upon the shore; that substantially this continued *for at least a month;* in all probability no female from the ship during all that time setting foot upon the shore; and that it was not until *Wednesday*, 21-31 *March*, that "the Carpenter that had beene long sick of the scurvey" was able ('Relation,' p. 35) to fit up the shallop "to

fetch all from aboord," and the ship was cleared, the whole company transferred, and the colonizing made complete.

But if no one comprehensive "landing" ever took place from the *Mayflower*, and if no communication was found possible between ship and shore, on the 22d December, old style, the hypothesis of the *Nation* seems badly to need readjustment.

3. A few words further touching the *Nation's* extraordinary idea that, since 1769, the posterity of the Pilgrims in Plymouth have been —with the exception of the last few years, when they have been observing the 21st—keeping the 22d December, *new style*, in memory of the fact that they have supposed their fathers to have landed there from the *Mayflower on the 22d of December, old style.*

In the first place, the descendants of the Pilgrims have long been sufficiently familiar with the facts of chronology to be aware that if they desired to honor the day which in 1620 was known to their fathers as the 22d of December, it would be needful for them to celebrate what in these days is accounted to be the first day of January.

But to us who have been all our lives studying this history on the ground, it is clear that nobody in Plymouth ever undertook to celebrate any event which was supposed to have taken place on the 22d of December, old style. What the Old Colony Club on 22d December, 1769, supposed itself to be especially commemorating was what happened in Plymouth harbor on the 11th December, 1620, old style. They made a mistake of one day, because in the new-style calculation, on which only seventeen years before they had entered, they were, as required by statute, adding *eleven* days to all previous dates of that century to bring the beginning and the end of it into chronological harmony: and it did not, at the moment, occur to them that the involved *principle* would require only ten days to be added for the previous century. But what they had in mind was the landing from the shallop, and not any imagined later landing from the ship. This will appear from careful examination of the records of the club; from Belknap's 'American Biography' (1798, ii., 204); from Thacher's 'History of Plymouth' (ed. 1832, pp. 179-198; ed. 1835, pp. 180-195); but more particularly from certain other testimonies. One is from the discourse delivered at one of the early celebrations (that of 1806) by the distinguished American annalist, Dr. Abiel Holmes, whose care and accuracy in regard to all such matters were second only to those of his master, Prince. He says ('Discourse,' etc., p. 16):

"There [on Clark's Island] they [the shallop's company] kept the Christian Sabbath. The day following [Monday, 11th Oct., O. S.], *you remember* it was [he was speaking to the antiquaries of the Old Colony], they sounded the harbour lying before us and came on shore. *The feet of the Pilgrims then first stepped on that* ROCK, *which your filial piety has sacredly preserved;* and which will be at once a memorial of the event and a monument of their honour to the latest generation."

That I do not misinterpret him here will be obvious from his 'American Annals' (i., 163, note,) where he says, after speaking of the shallop landing:

"The 22d Dec., new style, corresponding to the 11th, old style, has long been observed at Plymouth, and occasionally at Boston, in commemoration of the Landing of the Pilgrims."

Judge Davis—than whom no learned antiquary ever had a more deserved celebrity—in his edition of Morton's 'Memorial' (1826, p. 48) bears the like testimony.

Is it asking too much most respectfully to request the *Nation* to adjust its historical judgments to these facts in the case—and the unnamed many which they sample—and not to lend the great influence of its assertion to the subversion of those faithful annals of the past toward which all true scholars are toiling, and as to which they may invoke its aid?

I have the honor to be, faithfully, yours,

HENRY M. DEXTER.

GREYSTONES, NEW BEDFORD, MASS., July 10, 1882.

[Our "view" of Forefathers' Day, as applied to the anniversary of the Landing of the Pilgrims in 1620, was expressed in these words: "Whether that disembarkation was made in one day, or occupied several days, is not so material. It is the idea of a general landing of men, women, and children that has made any one day remarkable; and the stream of literature sets in one plain direction—to the 'consecration' of the landing of the Pilgrims from the *Mayflower* on the 22d of December, 1620." And now, after a careful and candid study of the "evidence presented on the other side," we find nothing to shake that view, but, contrariwise, we find suggestions to strengthen it. Our correspondent asks us to "notice what Bradford, at the time and on the spot, wrote as to the day when the *Nation* assures us that the whole *Mayflower* party landed on the rock." And in return we must ask him to notice that the *Nation* did not "assure us that the whole *Mayflower* party landed on the rock" on the day named, and that it merely repeated the traditions of the landing as they were connected with Forefathers' Day. It is proper to state that the lines to which our attention is called are taken from that well-known work commonly entitled Mourt's 'Relation,' and that it is not absolutely certain that they were penned by Bradford. We are surprised that our correspondent should find it "clear that nobody in Plymouth ever undertook to celebrate any event which was supposed to have taken place on the 22d of December, old style." The article which has drawn out his communication furnishes evidence, as we believe, that the celebrants had in mind an event—to wit, the landing from the *Mayflower* —indicated by tradition as occurring on that very day. And we really doubt if even one in one thousand among those engaged from year to year in the celebration at Plymouth and elsewhere had any thought that the "shallop" landing on the 11th was in the remotest degree connected with the day which was commemorated.

"The descendants of the Pilgrims have long been sufficiently familiar with the facts of chronology to be aware that if they desired to honor the day which in 1620 was known to their fathers as the 22d of December, it would be needful for them to celebrate what in these days is accounted to be the first day of January." So says our correspondent, with admirable exactness. And yet, in his very next paragraph, he says that when they undertook to honor the day known to their fathers as the 11th of December "they made a mistake of one day"! The first settlers, most assuredly, were familiar with the facts of chronology; they were acquainted with the chronological styles, as well with the new as with the old. Their residence in Holland had necessarily made them familiar with both styles; doubtless they taught their children the lesson of difference—that with dates of the seventeenth century it was ten days. The lesson endured from generation to generation. Prince's 'Chronological History of New England' (published in 1736) was a common book in the Old Colony. Twice on one page has Mr. Prince occasion to note the difference in date for events occurring in 1620, as (Part I., p. 68) "May 25, or June 4, N. S.," "May 31, or June 10, N. S." And under 1618 we find "December 10, or 20, N. S.," the very date of the Sunday in 1620 spent by the "shallop" party on Clark's Island. We regard as improbable the supposition that any mistake was made by the Old Colony Club in its first public celebration of the day of the landing, and as even more improbable the supposition that, if any mistake had been made, it could have stood for a twelvemonth uncorrected. If the descendants of the Pilgrims "desired to honor the day which in 1620 was known to their fathers as the 22d of December," they would have taken the day as it was marked in the calendar, without concern for new or old style. The act of Parliament for the correction of the calendar provided that certain feast-days, holidays, fast-days, meetings of assemblies, etc., etc., were to be kept and observed "on the same respective nominal days on which the same are now kept and observed." And so we find that the anniversary of the "Powder Plot" was marked for the 5th of November, and the "Restoration of King Charles" for the 29th of May, the same in the new as in the old-style calendars, with many other events "too numerous to mention." No change of "style" would have required a change of the date of Forefathers' Day.

The 11th of December, 1620, presents no event worthy of special observance. A very small minority of the immigrants, with a party of the ship's officers and sailors (after spending sixty hours on an island in the harbor of Plymouth, within gunshot of the main shore), "sound the harbor," "march into the land," and "return to the ship." Forefathers' Day, in the almost universal acceptation of the term, means something else. It presents for commemoration the Landing of the Pilgrims—the landing of men, women, and children—"landing from the *Mayflower* on the rock of Plymouth." Tradition has fixed upon the 22d of December, 1620, as the date of the landing; and if, in regard to that date, history and tradition run counter, the sentiment attaching to the 22d remains undisturbed. An extract from Palfrey is to the point: "The *twenty-second* day of December has taken a firm hold on the local thought and literature, which the *twenty-first* will scarcely displace."—ED. NATION.]

HOW TO STOP POLITICAL ASSESSMENTS.

TO THE EDITOR OF THE NATION:

SIR: Abuses are never voluntarily given up by those who profit by them. Indulgences and dispensations were not abolished by the popes, nor absolute government by kings, nor slavery by slaveholders. The extortion of "free gifts" from a hundred thousand men, women, and boys, employed by the United States, will not be voluntarily abandoned by Jay Hubbell and his consorts. Abuses must either fall by attacks from the outside or they will stop when they become unprofitable. And here the friends of reform have got the better of the extortioners at last. They have succeeded in forcing Hubbell

to proclaim openly through the land that assessments have been laid by the Republican party committee for as many as sixteen years, and that not one person has ever been removed, or otherwise troubled, for failing to come to time with his "voluntary contribution." The Civil-Service Reform Association can do nothing better than to publish that letter in a hundred thousand printed copies, and send one to each officer and employee of the United States. That will, in Mr. Hubbell's classic phrase, tend to "confuse their minds" to such a degree that nobody will contribute at all.

If this is not sufficient to make assessments unprofitable, and thus to bring them to an end, I think that the wealthy and influential friends of decency in the methods of government ought to associate for the purpose of finding employment at once for any person who loses his employment in a Government office for failing to give a percentage of either his time or his wages to the bosses. But if such an association be deemed too costly an undertaking, I know of a cheaper method still—a pledge by all wealthy Republicans of the country who are not connected with the Machine, not to contribute a single copper to any electioneering fund, local or national, until this whole business of assessments is given up for good.—Respectfully, L. N. D.

Louisville, Ky., July 9, 1882.

THE "KAHAL" OF THE RUSSIAN JEWS.

To the Editor of The Nation:

Sir: In the April number of the *Century* a Mme. Ragozin undertook to justify the barbarous outrages which are being committed on the Jews in Russia on the ground that the Jews live under certain institutions which are endangering the life, health, and prosperity of the Christian subjects of the Czar. As the most abominable and most provoking of these institutions she designated the "Kahal," pointing it out as the particular, if not the principal, cause of the atrocious outbreaks against the Jews. That Mme. Ragozin has, with her ridiculous as well as malicious story of the terrible "Kahal," imposed alike on the editor of the *Century* and the American public, the following frank and simple declaration will prove. It is issued by the representatives of the Jewish congregations who were called to St. Petersburg in the spring of this year by the Imperial Government to advise in regard to the Jewish question, and has been published in the *Golos* and other Russian journals:

"By ukase of the Senate of May 21, 1786, it was prescribed that there should be established in every Jewish congregation a supervisory board of three to five persons under the Biblical title 'Kahal'—*i. e.*, public meeting to equalize the taxes among the Russian Jews, and to see that they met their fiscal tax-obligations. By imperial ukase of December 9, 1844, the institution of the 'Kahal' was abolished everywhere except in Riga and some cities of Courland.

"In spite of this, however, the malicious calumny, that there exists among the Russian Jews a secret Kahal institution, which tries by various illegal means to sustain the exclusiveness and particularism of the Jews, and to aid them in the attainment of various aims hostile to the other classes of the population, is still persevered in.

"In the hope of putting an end to this wholly unfounded calumny, based exclusively on forged documents composed by a Jewish renegade, we, the undersigned, representatives of the different centres of the Jewish settlements in Russia, rabbis, members of ecclesiastical and synagogue administrations, etc., consider it a sacred duty, calling the Omniscient Lord to witness, to declare publicly, before all Russia, that there exists in the life of the Russian Jews neither a public nor secret Kahal institution, and that such an organization, and all the attributes assigned to it, are entirely foreign to the life of the Jews."

Will the *Century* please take notice of this declaration, in justice to the Jews, on whom Mme. Ragozin's article was a gross libel?

Ismar S. Ellison.

Buffalo, July 10, 1882.

Notes.

Jansen, McClurg & Co., Chicago, will publish, in two large volumes, 'The Military Telegraph during the Civil War in the United States,' by Wm. R. Plum, formerly an active member of the Telegraph Corps.

Houghton, Mifflin & Co. announce that they will issue, by subscription, a fourth volume of Knight's 'American Mechanical Dictionary,' bringing this admirable work down to date.

'England, Picturesque and Descriptive,' by Joel Cook, the American Correspondent of the London *Times*, is in the press of Porter & Coates. The edition will be limited; the illustrations abundant enough; the size quarto.

The second edition of 'The Revolt of Man,' which appeared anonymously in "the Leisure Hour Series" (Henry Holt & Co.), will bear the author's name, Walter Besant.

Dr. Robert Young, of Edinburgh, offered to buy of the assignees of the late American Book Exchange "the unauthorized and imperfect plates" of his 'Analytical Concordance.' The offer was not heeded, and a new edition has been printed from the plates in competition with the authorized edition published by Funk & Wagnalls. Dr. Young asks the coöperation of the American press in protecting him in his rights by giving publicity to these facts. The outrage of pirating cyclopædias and works of kindred magnitude and laboriousness cannot, indeed, be too strongly denounced.

Prof. George Ebers complains in *Das Magazin* that his 'Daughter of an Egyptian King' has been dramatized and is to be played at Detmold, without one word of consultation with him, although long passages are taken bodily from the romance and simply turned into verse. 'Uarda' has been represented at the Victoria Theatre in Berlin again without his knowledge, and very badly. Nor could a notice on the title-page of 'The Sisters' that the right to dramatize it was reserved save that story either from stage piracy. A petition for a change in the law which makes such treatment possible has already been sent to the Reichstag.

Under the title of 'Familiar Studies of Men and Books' (London: Chatto & Windus; New York: Scribner & Welford), Mr. Robert Louis Stevenson has gathered into a volume ten essays on men of letters—if John Knox may be called a man of letters. Mr. Stevenson's nationality makes his paper on Burns—intended as a corrective of Principal Shairp's monograph—as sympathetic as it is penetrating. To us the most interesting essays are those on Thoreau and Walt Whitman. The latter originally appeared in the *New Quarterly Magazine*, and was noticed at length in the *Nation;* it seems to us to be one of the few sane criticisms of this poet. Excellent also is a paper on Samuel Pepys. Among the other authors considered are Victor Hugo, Villon, and Charles of Orleans.

The shorter essays reprinted from the *Times* in Mr. James Payn's 'Some Private Views' (London: Chatto & Windus; New York: Scribner & Welford) will be new to most American readers, and two of them at least, on "Whist-players" and on "Invalid Literature," are quite in Mr. Payn's best manner; but those from the *Nineteenth Century* are more familiar, and will be remembered as having called forth much comment and discussion when they first appeared. They are all lively, and they could have been written only by a very clever man with a wide knowledge of men and books. The examination of the pecuniary advantages of the literary calling, and of the average chance of a bright young man's success in it, is more pertinent to the rigid conditions of life in England than it is to our flexible society, in which both the physician and the lawyer hold higher social positions than in England, and in which the journalist has a recognized rank. The sequel to this essay, however, the discussion of the whole art of story-telling, with its bundle of practical hints for the 'prentice novelist, has a more than local value.

Mme. Th. Bentzon's translation of Mr. Aldrich's 'Queen of Sheba' is one of the latest volumes in the "Collection Michel-Lévy," which is the French equivalent for our cheap libraries, though the volumes are 12mos and are mostly copyright. They cost a franc and a quarter each.

In 1846 the French daily papers announced as soon to be performed a play by Victor Hugo on "Mazarin," but it has never been acted. It seems that four acts are written, and that the poet intends revising and completing the play shortly for publication, under the title of "Les Jumeaux."

'Voltaire: Bibliographie de ses Œuvres' is the title of a work by M. Georges Bengesco (Paris: Ed. Rouveyre et G. Blond; New York: F. W. Christern), which is to fill three volumes, now ready for the press, and which is to do for Voltaire what M. Paul Lacroix and M. Émile Picot have already done admirably for Molière and Corneille, and intend doing also for Lafontaine and Racine.

Every one who watches literature must have noticed the increasing frequency of the practice of adding bibliographies to lives of men and to other works, especially to treatises on scientific subjects. The custom has at last reached legislative bodies. *Polybiblion* points out that the *Journal Officiel* of May 11, in its "Documents parlimentaires," gives (p. 1149) a "Bibliographie relative à la question du régime des boissons," and that a bibliography of works on the situation of the clergy had already appeared (p. 745) in a report of M. Corentin-Guyho on a proposed law concerning the clergy.

A new edition, in five volumes, of Thomas Bewick's 'Quadrupeds,' 'British Birds,' 'Æsop's Fables,' and posthumous 'Memoir,' is to be brought out at the instance of his surviving daughter Isabella (aged 92). It will be throughout of Newcastle manufacture, and will be printed, so far as the cuts are concerned, from the original blocks—the family treasure. But 650 copies will be printed. Bernard Quaritch is the publisher.

The Circular, just issued, of the Local Committee for the Meeting of the American Association for the Advancement of Science, at Montreal next month, informs the members of the Association that its sessions, beginning on August 23, will be held in the buildings of the McGill University. The Queen's Hall, University Street, will serve for the public evening meetings. The address of the retiring President, Prof. George J. Brush, of New Haven, will be given on the first evening of the session. On the second evening following, the President of the Association, Principal J. W. Dawson, of Montreal, will hold a reception in the new Peter Redpath Museum, which will then be formally opened. The customary excursions to neighboring places will be an agreeable feature of the coming meeting of the Association. Several eminent scientific men from abroad have already signified their intention to be present and take part in the sessions of the Association: among them Dr. William B. Carpenter, Mr. Herbert Spencer, Dr. Samuel Haughton, of Dublin, and Prof. A. Renard, of Brussels.

—The Philological Association had an interesting meeting at Cambridge last week—a substantial address from the retiring President, Prof. F. D. Allen, of Harvard University, on the University of Leyden; valuable papers from Prof. W. D. Whitney, whipping in erring Germans to true views of "surds and sonants" and "the origin of case-endings"; a capital paper of original research, by Dr. I. H. Hall, into the bibliography of the Greek New Testament as published in America; an interesting paper by Prof. W. B. Owen, of Lafayette College, on the influence of the Latin syntax on the Anglo-Saxon Gospels; and other papers on Greek, Latin, and Anglo-Saxon subjects. The Philological Society of England has asked the American Philological Association to unite with it in preparing a list of words in amended spelling, so that the "joint scheme might be put forth under the authority of the two chief philological bodies of the English-speaking world." The invitation was favorably received, and a committee appointed, with power to act for the Association within the limits of former reports adopted by the Association. The committee consists of Prof. F. A. March, of Lafayette College; Prof. W. D. Whitney, of Yale College; Prof. F. J. Child, of Harvard; Mr. J. Hammond Trumbull, of Hartford; Prof. T. R. Lounsbury, of Yale; Prof. T. R. Price, of Columbia; and Prof. W. F. Allen, of the University of Wisconsin. The Spelling Reform Association held its sixth annual meeting in Sever Hall, Harvard University, immediately after the adjournment of the Philological Association. The convening members were mostly philologists. They were not very numerous, and they did not claim that anything very astonishing had been done during the past year. They thought, however, that there had been substantial progress. A league was started of persons agreeing to use simplified spelling, beginning with such amended words as are given in the dictionaries: *program*, *iland* for *island*, *sovran* for *sovereign*, *rime* for *rhyme*, *ake* for *ache*, as in Worcester. Prof. Scott, of Columbia College, was appointed to prepare a list of such words. Prof. W. D. Whitney was the first signer of the League.

—The 'Constitution, Standing Rules, and List of Officers and Members of the Philosophical Society of Washington, April, 1882,' makes a large exhibit of membership, the total number enrolled being 246, of which 149 are active members. The scientific meetings of the Society are held bi-weekly in the Army Medical Museum, and the character and dignity of many of the papers presented (very often the results of the labors of scientists in the employ of the Government are embodied in papers read there for the first time) should suffice to warrant their initial publication in a series of memoirs, which, however, the Society would seem not to have the means of issuing. The only publication of the Society is its Bulletin, or Proceedings, in which only now and then is a paper published in full, being usually given by title simply, or in brief abstract. The officers of the Society are: President, William B. Taylor; Vice-Presidents, J. K. Barnes, J. E. Hilgard, J. C. Welling, J. J. Woodward; Treasurer, Cleveland Abbe; Secretaries, M. Baker, T. N. Gill.

—The *North American Review* for August contains an article by Mr. Archibald Forbes on the Army of the United States, in which the condition in life of the American soldier is contrasted with that of the English, to the disadvantage of the latter. The former gets better pay, better rations, and a better provision for retirement, and last, but not least, a better prison. According to Mr. Forbes, "over two per cent. of the actual enlisted strength of the American Army" are in Fort Leavenworth prison, and it is by no means a bad place for a soldier who does not like military life. His hair is not shaved, as a British soldier's would be; he has an airy barrack-room for quarters, far more comfortable than the tent or hut which he would probably be occupying with his company:—

"Here he has his bed from the first night, and the liberty of unrestrained conversation with his fellow-prisoners His food is the liberal ration issued to the American soldier, better indeed than the ration which the latter eats in remote stations, and supplemented in season by the produce of the prison garden tilled by the prisoners themselves. He eats this food in the company of his fellows, in a spacious dining-hall, equipped in a fashion so civilized as would shame a British barrack-room. The labor to which he is put is some handicraft the practice of which meanwhile has a rational interest for him, and the conversance with which, acquired in prison, may furnish him with an honest livelihood when again he shall be a free man. He is treated in every way as a rational being, rather than, as is the case with a British military prisoner, as a dog that has misbehaved and that is ever watching for a chance to misbehave again. He is allowed an individual freedom of action that is simply startling to the British observer of him; said freedom of action complicated only by the outer wall and by the bullets in the rifles of the prison guard. Occasionally, although rarely, he 'plays the fool,' and declares that he will work no more. Still he is treated, not as the misbehaving dog, but as the normally rational being suffering under a temporary aberration. He is brought into the presence of the Governor, who 'has a talk with him,' pointing out to him the folly of his conduct, and the consequences thereof. Save in exceptional instances, this expedient restores him to reason; if it does not, a course of dark cell and bread and water produces the result, and he returns to the shoemaker's shop or the smithy a wiser and probably a better man. By good conduct he can shorten considerably his term of confinement. When that expires, he goes out into the world supplied with a suit of decent clothes—for it is held cruelty to stamp him with a convict brand—the possessor of a small sum of money, and of a railway warrant for his conveyance to the place of his enlistment. Yet further to mark his rehabilitation, if his prison conduct has been exemplary, he receives a certificate that entitles him to reënlist in the Army, if he should have the inclination so to do."

Most of the inmates are deserters, and considering the liberal inducements which the Government service holds out, it may be doubted, on Mr. Forbes's showing, whether the régime at the Fort Leavenworth prison is not open to the charge of being a little too pleasant and comfortable, considered as a means of repressing the crime of desertion. It recalls a little too much the discipline of the famous brig on board of which every tar was furnished by the kind commander with a copy of the *Saturday Review*. Mr. Forbes considers that our Army is managed throughout with a stricter view to business principles than that of Great Britain, and cites many illustrations of the bad effect in the latter produced by "influence"; but surely "business principles" do not require that even an exemplary deserter should receive a certificate entitling him to reënlist, with a railroad pass to his place of original enlistment. Mr. Charles W. Elliott contributes a rather startling article on "Woman's Work and Woman's Wages," in which he insists that much of the hardship which women suffer comes from their being "so ignorant as to believe that brain-work needs and should have high wages; hand-work small wages." The poor things believe it, we suppose, because they are told so by the wicked men, who, as they still do most of the brain-work, have a sinister interest in keeping up this economic delusion as long as possible. The "cure," according to Mr. Elliott, is that "the strong must care for and help the weak, the wise the foolish, the old the young, and the young the old, and if this does not come to pass, Christianity is a delusion, and Civilization a failure, and Society a ruin."

—The Imperial Academy of Sciences, Vienna, announced in 1870 its intention of awarding a gold medal for every original discovery of a comet. The stimulus to the advancement of cometary astronomy resulting from these awards is well known. The Academy withdrew its offer in 1877, and the most calamitous outcome of the discontinuance appears to have been that Mr. H. H. Warner, of Rochester, should have considered himself called to establish a similar prize—after his own fashion, however, and chiefly as a pharmaceutical advertisement. Mr. Warner and his "consulting astronomer" have undergone such severity of ridicule in this matter that recently, after the distribution of a series of two-hundred-dollar prizes, a new scheme has been circulated, from which the objectionable features of business advertising are subtracted, but from which it is nevertheless apparent that Mr. Warner still retains somewhat of the proprietary right in comets and such like. Very possibly Mr. Warner thinks he has quite as much right to define all the conditions under which his award shall be made as to say who shall have his druggist-stuffs and who not; indeed, the one would seem to be to him about as much of a business barter as the other. But, as we may now credit him with a genuine wish for the furtherance of cometary astronomy, it seems as if he ought to know that the imposition of a condition restricting the announcement of discovery of a comet cannot be otherwise than fatal to his scheme. Very fortunately, however—and this Mr. Warner ignores—all this matter of the early announcement of cometary discoveries was long ago adjusted very perfectly, in the shape of an agreement among astronomers the world over that the collection and transmission of such immediate announcements should be confined to acknowledged centres. Obviously, the Smithsonian Institution is the only appropriate centre for this purpose in the United States; and the folly of insisting upon the diversion of these announcements from their wonted channel is already apparent from the fact that the announcements of discovery of some recent comets—despatched to Rochester by the discoverers in order to fulfil the conditions of Mr. Warner's prize—never reached European astronomers at all. In point of fact, the only scientific condition which can be imposed with reference to the discovery of a new comet is simply that pertaining to the first observation—viz., that it be sufficiently precise to be serviceable in determining the elements of the comet's orbit; the astronomer securing such observation being entitled to the award of whatever discovery prize there may be.

—It is a constantly fresh surprise that when there is a lion in the path he can be made to run away by so slight an expenditure of courage and energy. The catalogue of the British Museum has been a lion in the path for more than a quarter of a century; or, to change the metaphor, it has been an elephant on the hands of the Trustees; and yet when a man of enterprise became principal Librarian, it was found to have no greater staying qualities than Jumbo. How to print the Museum catalogue has been the standing question for discussion in literary journals, at library conventions, and when two or three bibliographers were gathered together. All the commonplaces about a printed catalogue being antiquated as soon as it is issued, about the enormous expense, much better put into books, about the necessity of finishing it before beginning to print, have been brought forward again and again, and the project has been long since abandoned by all reasonable people as hopeless. And yet the British Museum is to-day actually printing its catalogue on a very simple

and perfectly satisfactory plan. Formerly, when one of the volumes of the manuscript catalogue was too full to receive any further additions, it was sent to the binder, who repasted all the slips in such a way as to make three or four volumes out of one, with plenty of room for the insertion of new titles. For a time this was not unsatisfactory, but the result was rather alarming. The catalogue now fills nearly three thousand folio volumes. There is a limit to the capacity of the famous reading-room, and that limit seemed likely to be soon reached. Something evidently must be done. So physical considerations brought about what all the demands of all the learned all over the world might not have obtained. It was resolved to condense each volume, as soon as it was full, by printing it. The printed slips could be used as the foundation of a new series of volumes, and as titles take in type so much less room than they do in manuscript, the Museum might grow to quintuple its present size without its catalogue occupying more space than it does now. The advantage, also, of being able to set two or more copies of the catalogue before readers, so that two persons can consult the same part of the alphabet at once, is not to be despised. It was also determined to offer the printed copies to other libraries and scholars at a nominal price. For £3 a year one can get all that shall be printed during that time of one of the largest and most carefully catalogued libraries in the world. As about 2,800 pages were published last year, the price is certainly not high. It may, to be sure, be forty years before one will have the whole, and it will not then represent the library at any one stage of its existence. But the fact still remains that it will be the catalogue of an enormous collection of valuable books, a mine in which the bibliographer can delve for a lifetime. There is a man who has read the catalogue of the Bodleian Library, in four folio volumes, through twice. No doubt somebody has already begun the work of reading through the Museum catalogue, an occupation of truly endless delight. Cataloguers, too, in numberless libraries will get great comfort from it and abridge their own labors by using the investigations of the London laborers. No doubt when all the volumes are in type some means will be devised by which the additions shall be printed also in alphabetical order, and not as now (in the second series publishing by the Museum) in the helter-skelter order of annual accession.

—To the list of German periodicals devoted to Romance philology may now be added *Romanische Forschungen* ("Organ für romanische Sprachen und Mittellatein"), published by Karl Vollmöller. This new work will appear at irregular intervals, and the volume, consisting of four numbers, about two hundred and forty pages, will, for the present, cost fifteen marks. No other existing periodical in this field devotes any considerable space to the important subject of mediæval Latin, so necessary for the elucidation of many vexed questions. The present number contains an important article by O. Dietrich, on the repetitions in the Old-French *chansons de geste*, and the first instalment of a Latin text of the eighth century, a translation of Dioscorides. This text is full of interesting examples of phonetic changes, as for example, *cauculos* (for *calculos*), *esspecies*, *isspargis*, *decoptum* (for *decoctum*), etc. In addition to these, are valuable contributions to Spanish etymology and the correction of Provençal texts. The list of contributors and the articles promised for future numbers assure the success of this new venture, in connection with which we may mention another work, almost periodical in its nature, and belonging to the same department of study: we refer to E. Stengel's 'Ausgaben und Abhandlungen aus dem Gebiete der romanischen Philologie,' of which three parts have already appeared, containing the "Chanson de St. Alexis," and some shorter Old French poems of the eleventh and twelfth centuries, an Italian version of the "Chanson de geste Fierabras," and various contributions to the criticism of the French Carolingian epics. A supplement to the first volume, or number, has just appeared, which is of interest and value to all students of early French. The separately printed edition bears the title 'Wörterbuch der ältesten französischen Sprache' (Marburg, 1882). It is in reality a *Sprachschatz* to E. Koschwitz's 'Les plus Ancien Monuments de la Langue Française' (Heilbronn, 1880) and to the texts above mentioned. The glossary contains every word in the oldest French texts, with illustrative passages from later works: every form is given separately, and at the end are two appendices, one a list of the words used in assonance and rhyme, the other a conspectus of the words arranged according to classes and forms. This latter appendix is practically a grammar of the oldest French, with the advantage of showing every form.

—The eighth volume has just appeared of both the 'Théâtre de Campagne' and of 'Saynètes et Monologues' (New York: F. W. Christern), and for the first time in their career of rivalry the latter is better than the former. In the 'Théâtre de Campagne' are ten plays and five monologues; and of the whole fifteen only "Les Claqueurs," by M. Jacques Normand, is really first-rate; as acted by the two MM. Coquelin it was probably very amusing. Next in value are two monologues, "Le Violon," by M. Charles Cros, for a gentleman to recite, and "Le Rideau," by M. Eugène Verconsin, for a lady to act—we say to act, advisedly, for although there is only one part in M. Verconsin's little play, it is really a play and not merely a "piece" to "speak." In the latest volume of 'Saynètes et Monologues' the general average is higher, and "Ce Monsieur," by the writer who signs "Quatrelles," is more frankly comic than anything in the corresponding volume of the 'Théâtre de Campagne.' It cannot be denied that there has been a falling off in both series lately. Perhaps the vein is nearly exhausted. Two of the monologues in 'Saynètes et Monologues' deserve to be singled out: one is M. Truffier's poem, "Les Statues," and the other is M. Paul Arène's very comic soliloquy of a lover by the edge of a frog-pond under the mellow rays of a summer moon; this is called "Un Drame à Cernay."

—"No page of the history of any nation, however gloomy it be, is so destitute of value that that nation cannot draw from it valuable lessons; and Greece of the present day is politically disordered because she has ignored this truth." "Only when based upon local self-government can parliamentary government fulfil its appointed purpose: to assure the political freedom of a country." These are among the concluding sentences of a valuable essay on 'Public Law in Greece under the Turkish Domination' (Τὸ ἐν Ἑλλάδι Δημόσιον Δίκαιον ἐπὶ Τουρκοκρατίας), by Nicholas Moschovaki, Assistant Professor in the University of Athens. This volume of 200 pages may be commended to those who are interested in Greece, as a careful study of the administration of that country under the Turks. The second part of the book seeks to explain by what means it came to pass that, even in the days of Turkish rule, the actual administration of many localities was entirely in the hands of Greeks. The author first takes up the Greek Church as a political influence, and, without representing the Church as worse or better than it really was, gives an interesting account of the Œcumenical Patriarchate and its relations to the Sultan, the Fanariotes, and the Greek race. He quotes Mr. Finlay's saying, that the "only buttresses of modern Greek nationality are the Greek Government and orthodox Christianity." To these he would add a third: self-government in communities. Next follow graphic sketches of the best examples of local self-governments as they existed in various parts of the Peloponnesus (notably in Maina), in Northern Greece, and in the islands. Especially interesting is his account of the administration of Hydra, Spetzai, and Psara—those islands which rendered such noble service in the Greek Revolution. The administration of most of these communities was in the hands of certain leading families; the yearly or semi-annual meeting of all the citizens was held within or before the church, after divine service; the offices, with some exceptions, were held without compensation; the management of the public interests was, in many cases, most admirable.

—Unfortunately, on the establishment of the Greek kingdom, this attested capacity for local self-government was entirely ignored. Hence Otho, in spite of all his virtues, his love for Greece, his honest administration, was swept from the throne. Now Greece has a liberal constitution, but the administration is still centralized. The demarchs (mayors) and most of the inferior employees are responsible, not to the communities whom they serve, but to the central Government. The indispensable change is: that this responsibility be terminated, that local officials hold their positions as long as they obey the law, and that gradually the local communities reassume the rights and burdens with which they have become so unfamiliar that they no longer desire them. If, under the oppression of Turkish rule, what may fairly be called a system of local self government could develop in many localities, why should it not reappear in these brighter times, if only its need is clearly felt? Every thoughtful book like this, which sets forth plainly that "who rules" is not so important as "how he rules," and that the tyranny of the majority is as really oppression as Turkish rule, is a pledge of a better state of things in Greece.

THE LONGFELLOW BIOGRAPHIES.

SEVEN Greek cities contended for the dead Homer; six American biographers are already contending for the dead Longfellow. The contestant cities could do little harm; but there is something unseemly in the spectacle of the warring biographers hovering, pen in hand, round the very death-bed of the great author, like the two medical students with their lancets around the affray in 'Pickwick.' The disclaimer so promptly issued by the children of Mr. Longfellow appeared none too soon, but it has not arrested the flood of books. *Dux femina facti:* a woman took the lead. And after Mrs. Blanche Roosevelt Tucker-Macchetta came Messrs. Kennedy and Underwood and Stoddard; while Messrs. Austin and Greene have already made their public announcements. Five of these six make the unhesitating assertion that their respective works were expressly favored and aided by the poet himself. If we are to credit their collective statements, we have, instead of the simple, manly, reticent Longfellow, whom we thought we knew, a most undesirable substitute; a man eager, above all others, to be discoursed upon and gossipped about. Each biographer seems deeply interested in at least one person besides Mr. Longfellow: the most conspicuous desire of each seems to be to prove that he himself stood nearest to his hero—to prove, in a word, that "Codlin is the friend, not Short." From

this characteristic Mr. Kennedy's book alone is to be excepted. So far as this attribute goes, it is entitled to bear upon its cover the proud, distinguishing inscription: "N.B. This book does *not* claim to have been authorized by the late Mr. Longfellow."

The sternest advocate of the equality of the sexes will admit that in the race after personal gossip a woman has a certain advantage. No one else can approach so near a man, beguile so winningly, note such minute details of demeanor, and claim with such sweet naïveté an intimacy so extreme. Mrs. Blanche Roosevelt Tucker-Macchetta—for, like the Vicar of Wakefield, we like to give the whole name—had many advantages as a biographer. Her name itself must have been an attraction to the many-languaged poet; it seemed to represent four different tongues, and to be a 'Poets and Poetry of Europe' in highly-condensed form. She also seems to be a much-travelled person: for her 'Home Life of Henry W. Longfellow' (New York: G. W. Carleton & Co.) includes on different pages the condensed guide-books—almost as interesting as Baedeker, and in much the same style—of half-a-dozen European towns. Then her profession may have also been an attraction. She had evidently seen much of the world, across the footlights, and could describe Italian artists and English earls. Above all, she had wished to play "Pandora," and the kindly old poet, naturally gratified at coming so near to being a dramatic author, received with all his wonted graciousness the aspirant after fame, and habitually addressed her as "Pandora," thus adding a classic name to her four modern ones. She, in turn, approached him very much as Bettine Brentano approached Goethe. She did not actually take a nap with her head on his shoulder, like the trustful German damsel—for she was too busy listening to his confidences—but she hovered constantly about him, and called him always "Dear Master." If she is to be taken literally, she won him by these devices to chat freely with her about the most sacred experiences of his life—experiences about which, as has been hitherto supposed, he always drew a veil. We will not be so discourteous as to assert that on this point the lady's memory or imagination may have deceived her, but we will say that on some smaller matters she is absolutely to be disbelieved. Professor Longfellow, no matter how many other languages he knew, was at least acquainted with the English tongue; and when she represents him as saying of a delineation of himself, "It is me, and I will never have another taken better than that" (page 13), she attributes to him at least two grammatical solecisms which the testimony of a thousand Pandoras would fail to establish. If so inaccurate in this, why should she be trustworthy in more important matters? It is a less evil to have Mr. Longfellow depicted as ungrammatical than as a weak and garrulous old man; and since we know the first charge to be false, why believe the other? The lady has, like her mythological namesake, opened a box containing all manner of evil things, but she has not left a ray of hope at the bottom. Her book is conceited, inaccurate, vulgar, and worthless.

It is an immense advantage to Mr. Stoddard that his book was preceded by that of Mrs. Tucker-Macchetta. He certainly shares some of her weaknesses; he claims authority from the poet himself; he calls him familiarly "Henry Wadsworth"; and he prints little puffs of himself and his wife. In these personalities, however, he is utterly distanced by the lady; yet he has grave faults of his own, and it must be remembered that he has a certain literary reputation to sustain, while she had none. His 'Henry Wadsworth Longfellow: a Medley in Prose and Verse' (New York: G. W. Harlan & Co.) is, to speak frankly, one of the most discreditable pieces of literary padding that we have ever encountered. To swell its proportions, the editor inserts an essay of his own, twelve pages long, on the different translations of Homer; a long discourse of his own, before Mr. Adler's Society, on the "Poetic Art"—neither of these having any direct relation with his subject, Longfellow; and adds an appendix of letters from persons, not very distinguished, mostly apologizing for having no information to give about Mr. Longfellow. He reprints, like the other editors, some of the genealogical lore collected by the Maine Historical Society; he reproduces the early poems which Mr. Longfellow had the discretion to leave behind; and he employs, without acknowledgment, the careful Longfellow bibliography of the *Literary World*. But there is scarcely a sign of original investigation in the book, except such was implied in "a half-hour's glance over early volumes of the *Knickerbocker Magazine*," and very little of original criticism; while there is sometimes a slovenly and almost defiant indifference to facts easily ascertained. A letter or two sent to Cambridge or Portland could easily have ascertained for the most indolent editor that Mr. Longfellow's first marriage took place in this country, not in Europe (p. 60); that the well-known jurist, Theophilus Parsons, is no longer living (p. 16); and that the supposed boyish poem by Longfellow, exhibited on his seventy-fifth birthday in Portland (p. 12), turned out to be only some verses by Rogers copied as a schoolboy exercise in penmanship. The same careless and slovenly tone, the same preponderance of the first person, prevails everywhere; and the book closes with ten pages of doggerel which were composed by Mr. Stoddard on the day of Mr. Longfellow's funeral, and which are entitled to no better epithet than maudlin.

As Mr. Stoddard gains by the comparison with Pandora, so does Mr. Underwood by comparing him with Mr. Stoddard. His 'Henry Wadsworth Longfellow: a Biographical Sketch' (Boston: Osgood) is open to plenty of criticism, but it may at least be affirmed of it that it is not an insult to the reader. It has, like the others, the defect of claiming to have been expressly authorized. It is called only a sketch, and the preface gives the impression that under other circumstances it would have been far more adequately finished, yet there is no essential difference in this respect between the present work and Mr. Underwood's previous book on Lowell. Both books are disfigured by the insertion of little head-lines, at short intervals, instead of any division into chapters; and this gives a peculiarly trivial and newspaper-like air to both. One constantly expects to meet with, "The Nestor of the shoe and leather business," as in Bartley Hubbard's editorials.

This peculiarity really does injustice to Mr. Underwood's book, which is honestly conceived and carried out in what seems to the author the best way. It shows some faithful labor and some assiduous criticism; but, unhappily, an air of commonplaceness enfeebles all the result, and a little comparison with the Lowell memoir reveals the essential weakness of both works. Here were two men, living on the same street of the same town, moving in the same circles, writing in the same periodicals, holding successively the same professorship in the same college. Yet there never were two men, thus parallel in life, who were more utterly different in temperament, habits, genius, and literary methods. Here is the test of a biographer; and we look in vain through Mr. Underwood's book for a single incisive sentence, a single vivid touch of personal delineation, which shall make it forever clear to all beholders that the sitter for the one portrait was Longfellow, and for the other Lowell. To fail in this is to miss the essential thing; without it a book is not even a "sketch." It is only a collection of materials for a sketch.

Mr. Underwood, like Mr. Stoddard, is tempted to insert padding; and there are long passages —as, for instance, the discourse on the forms of poetry (pp. 234–241)—which seem to be extracts from some lecture on English literature. But he sins less in this way than his brother author, and is more careful as to facts, though sometimes heedless. Thus he clearly gives the impression that the Episcopal Theological School near Longfellow's residence is a part of the organization of Harvard University, though the College Catalogue takes pains to state the contrary. In his wish to be critical and decisive in tone, he sometimes does gross injustice and misstates facts. He admits (p. 119) that Poe had a quenchless hatred for New England writers, and attacked them all without mercy; and yet cites the authority of Poe, as if it were worth anything, for the very improbable statement that Margaret Fuller called Longfellow a booby and Lowell a wretched poetaster (p. 124). Why not go to her own writings, which are accessible enough, and find out precisely what she called them? What is Mr. Underwood's standard of accuracy of quotation may be gathered from the following sentence: "Mr. F. B. Sanborn mentions that she called Longfellow a dandy Pindar" (p. 124). But if Mr. Underwood will turn to Margaret Fuller's review of the first illustrated edition (1845) of Longfellow's works ('Papers on Literature and Art,' p. 326), he will find that she applied that epithet, not to the poet himself, but to the portrait of him prefixed to that volume—a portrait not perhaps so bad as that which appears in Mr. Underwood's own volume, but still combining dapperness and smartness in a way that makes the disrespectful epithet not so ill-fitting, after all. Nor can we believe, until we have chapter and verse for it, that so well-informed a writer as Mr. Sanborn has thus wrested this passage from its original meaning. If he has, Mr. Underwood, as a professed student of American literary history, should have been able to set him right.

In turning from the three books already mentioned to the 'Henry W. Longfellow: Biography, Anecdote, Letters, Criticism' of Mr. W. Sloane Kennedy (Cambridge: Moses King), one feels the sort of satisfaction which is to be found in a rather mediocre work modestly done, when contrasted with works of similar mediocrity and greater pretension. Mr. Kennedy's service has been done mainly with the scissors and paste-brush, but it has been performed laboriously and carefully. His authorities are carefully cited; he keeps clear of gross intrusions on privacy; the book is better printed and bound than any of the others, and, unlike them, it has an index. It comprises the essence of many of the best tributes to Longfellow; includes the inevitable early poems, and the bibliography from the *Literary World*, for which the editor gives credit, as also does Mr. Underwood. It must be owned that it contains a few very apocryphal anecdotes, as the description of Longfellow's night on Vesuvius, which is, however, taken from the London *Times*. Still, it is an honest piece of bookmaking, and will lead every reader to be glad, in view of such an undigested abundance of material, that the real work of preparing Professor Longfellow's memoirs is to be begun at once, by hands wholly competent. After they have appeared, even the best of these four books may be consigned to speedy oblivion.

ROGERS'S HISTORY OF AGRICULTURE IN ENGLAND.

A History of Agriculture and Prices in England. From the year after the Oxford Parliament [1259] to the Commencement of the Continental War [1793]. By James E. Thorold Rogers, M. P. Volumes III. and IV. 1401 to 1582. Oxford: The Clarendon Press; New York: Macmillan. 1882.

It is certainly significant, as indicating the present tendency of aggressive work upon economic subjects, that an author who is able to content himself with a small duodecimo volume when writing a 'Political Economy,' should not regard four octavo volumes, averaging seven hundred and forty-five pages each, as too pretentious when presenting a 'History of Agriculture and Prices in England,' though it cover a period of three and a quarter centuries only. This is as encouraging as it is significant. Students are becoming wearied with system building in political economy, and are beginning to recognize that honest work in facts is likely to achieve more permanent results.

The great purpose which Professor Rogers appears to have presented to himself in the preparation of this work was to complement the existing histories of the English people. The political and religious history of England from the standpoint of kings and the Church has been many times written; the growth of the Constitution, portraying development among certain classes of Englishmen, has likewise received frequent attention; something, too, of the character of the people has been learned from a study of what they read and what they sang; while a recent student has undertaken the blending of all these various colorings into a single picture of the life of the English people. But, curiously enough, there has been no satisfactory attempt to uncover the substructure of English history, and to learn of that which, to a large extent, is responsible for all other manifestations of national life.

It is this task which is undertaken in the volumes before us, and the service rendered by Professor Rogers may be said to consist in furnishing the student of industrial society with a certain class of facts never before available, except in the form of original documents. There is no romantic interest in collating records of sales, tenant contracts, articles of apprenticeship, and the like; in tracing the influence of currency measures and changes in custom respecting property, or in comparing price-lists of various commodities, to determine the tendency of the markets; but it is nevertheless true that any reading of history which does not accept these facts as essential for proper interpretation must fail to arrive at the true meaning of the period studied. That Professor Rogers recognizes the importance of the work he has undertaken there can be no question. "I do not doubt," he says, "that at no remote period all history which has neglected the study of the people, and all political economy which has disdained the correction of its conclusions by the evidence which facts supply, will be cast aside as incomplete and even valueless."

The plan of the work is quite simple. When completed it will cover the period from 1259 to 1793. The acceptance of the first date is accidental, being due to the fact that the author found continuous information from that year only. The date 1793, as closing the period of his investigation, is appropriate for two reasons: It marks the beginning of the Continental War, and is also the date at which that great monument of economic research, Tooke's 'History of Prices,' begins. The information contained in the two volumes that have just appeared is drawn for the most part from the records of purchases made by the great corporations. It would be natural to expect that the task of exploring a later period would be lighter than that of uncovering the facts of a period more remote; but, so far as prices previous to 1582 are concerned, this is not the case. Respecting corn, for example, more accurate information may be procured for the thirteenth and fourteenth than for the fifteenth and sixteenth centuries. The documents pertaining to the later period, though numerous, fail in comprehensiveness. For the first and second volumes (1259-1400) the author estimates that he consulted eight thousand documents, while for the new volumes (1401-1582) it was necessary to examine ten times that number. It is a source of some satisfaction to learn, however, that the study upon the third period (1583-1793) will not present similar difficulties, since subsequent to the year 1582 wheat and malt averages have been recorded every six months. As further showing the amount of work of which these last two volumes are the result, mention may be made that the record of wheat is drawn from 6,245 entries, and refers to 1,363 localities.

The care taken by the author to reduce his facts to a usable form is worthy of equal commendation. The third volume is devoted to a detailed statement of prices as they stood in the documents consulted. It contains no comments, and undertakes no averages, these being referred to the fourth volume, where one finds the author's interpretation of the facts studied. The system of averages adopted presents the tendency of prices in three forms: the first set refers to years, the second to decades, while the third is drawn for two periods, of which one embraces the 140 years previous to 1540, the other the forty-two years subsequent to that date. This division is admitted to be somewhat arbitrary, but is accepted on account of the importance attached to the influence upon prices of the debased currency issued by Henry VIII.

The peculiar economic interest of these volumes appears to centre in the currency measures of the sixteenth century, the monetary problem introduced being, to our author's mind, a very difficult one. The facts calling for explanation are as follows: From 1300 to 1544 the standard of fineness for English coinage remained unaltered, although the amount of silver in the coins had been continually lessened. Thus the money of 1543 stood to the money of 1299 in the proportion of 1.163 to 3. Yet in the study of prices during this period one observes no rise corresponding to the decreased amount of silver in the coins. In 1544 Henry VIII. began the debasement of the currency by increasing the alloy, and from about that date one observes a marked rise in prices. Is this a monetary phenomenon, or is it referable to other causes? The theory which Professor Rogers offers in explanation is, we believe, his own. It is that, until the coinage reform under Elizabeth, payments were made by weight and not by tale. So long, therefore, as the standard fineness was not impaired, the coining of more or less pieces out of a pound of silver would have no influence on prices. We do not purpose criticising this theory so far as to deny its correctness, but we are constrained to say that there are some difficulties in accepting it.

Thus, in the first place, the absence of direct evidence in its favor is significant, and the indirect testimony offered, that there is frequent record of purchase by the large corporations of instruments for weighing gold and silver, is with equal ease capable of other interpretation. Again, if payments were made by weight and not by tale, there could have been no motive for chipping or for making any distinction between foreign low-weight and domestic full-weight coins. That such distinctions were made, and that the practice of clipping was general, is evidenced by the frequent enactments for the remedy of these evils; indeed, the reduction in the size of coins above mentioned was made in order that the new issues might correspond to the money already in circulation which had been debased by clipping. All this care to keep the coins of the realm uniform would have been unnecessary if the Government guaranteed the quality of the metal only, and professed no care respecting the quantity contained in the various pieces.

In the third place, this explanation of Professor Rogers neglects a recent modification of that law of monetary circulation, known as Gresham's Law, without which it cannot be regarded as correct. This law says that good and bad money cannot circulate together, but that the bad will drive out the good. That is, looking at the matter from another standpoint, the price of goods will be adjusted to the worst money in circulation, and no one will use a heavy coin to do the work which a light one would do as well. Prof. Francis A. Walker is, we believe, the first American economist who pointed out the fact that as stated this law is not true. Only when there is a superabundance of circulating medium will the best coins cease to be used. If an issue of debased coin is not sufficient to supply the wants of trade, prices will not be graded to the debased coin, and there will be for the time a concurrent circulation of good and bad money, as though all were good. Professor Rogers has, it appears to us, overlooked this fact, and proceeds in his reasoning as though prices quickly adjusted themselves to the new issues, no matter what the amount of the issue. Thus he says (p. 193, vol. iv.) that the price of wheat in 1547 was "lower than any recorded price if payment were made by tale." To support this conclusion he estimates the amount of silver given in payment upon the basis of the amount contained in the debased issues, yet fails to show that the new issues from 1543 were sufficiently large to supplant the money already in circulation. That this was not the case we have direct evidence in the result of the reformation of the currency in 1560; for notwithstanding the fact that Elizabeth restored the currency to its original fineness, and coined shillings containing 88.8 grains of silver in the place of certain issues falling as low as twenty, it was yet possible for her to manufacture £783,248 of new money out of the amount of silver brought in, which, according to the rates of the several standards, amounted to £638,113 only. This is conclusive proof that the bullion value of the average coin in circulation was greater than even the recoined standard of the reformed coinage, and therefore that the debased issues were not sufficiently large to cause prices to be graded to them. While they circulated they did the work of better coins. We would not say that Professor Rogers's theory is incorrect, but rather that there appears to be no necessity for any theory upon the subject, since, under a proper conception of the co-circulation of full-weight and debased coins, there is no variation in prices which cannot be otherwise explained.

By far the most pertinent of the conclusions reached in this study relates to the comparative well-being of the laboring classes in the Middle Ages and under the modern industrial régime. The facts upon which it rests are too voluminous for insertion here, but a careful comparison of the rate of wages with the price of living necessaries at various times leads Professor Rogers to support the complaint of the laborer that he has not partaken equally with the other classes of the benefits of our material civilization. The downfall of the English laborer dates from the

death of Henry VIII., the immediate occasion being the interference on the part of that monarch with the currency. The cause, however, lies deeper than this; it is only found when one perceives the radical changes in the industrial system which the new forces of modern individualism introduced. We cannot do better than quote the judgment of the author upon this point. Speaking of the conclusions to which his facts have led him, he says:

"They are stated in the briefest form when I refer to the fact that, while the rise, during the last forty-two years of the period before me [1540-1582] in the price of provisions was 2.71, the prices of the previous 140 years being taken as unity, the rise in the price of labor, and of objects whose main value depended upon labor, was only 1.64. These figures concentrate the results derivable from an analysis of facts. . . . They tell of the long cloud which was coming over the old sunshine of labor, and show how it was that the mass of the people was about to exchange a condition of comparative opulence and comfort for penury and misery, unhappily prolonged for centuries. From the Reformation till the Revolution the condition of the English laborer grew darker and darker. From the Revolution to the outbreak of the war of American Independence his lot was a little lightened, but only by the plenty of the seasons and the warmth of the sun. From the war of American Independence to the repeal of the Corn Laws it was at its very worst."

It is one thing for an agitator to make such statements; it is quite another when they are given as the result of scholarly and temperate research. It shows us that there does exist a social question.

As a compendium of useful, indeed essential, information, this work does not require the praise of a reviewer. Its merit is such that, when completed, it should, and probably will, gain for its author a reputation as a statistical economist equal to that of Thomas Tooke.

CHARLES DICKENS.

Dickens. By Adolphus William Ward. [English Men of Letters.] Harper & Bros. 1882.

Mr. Ward has not found much to say about Dickens that is new; indeed, the only part of his volume which can in any degree be regarded as an original contribution to literature (all the biographical portion of the work is necessarily based on Mr. Forster's life) is his chapter on the "Future of Dickens's Fame." In this he maintains that there is no reason to believe that Dickens's popularity has diminished since his death; that his influence may be traced through the writings of other novelists of great reputation, as, for instance, George Eliot in England, the author of 'Debit and Credit' in Germany, Bret Harte in the United States, and Daudet in France. There is no doubt about the last two, and the case of Daudet is a very remarkable one, for, à priori, one would have said that there would be nothing so unlikely to happen in literature as that a Parisian novelist of the Empire should import and make his own the humorous and pathetic treatment of character which was the foundation of Dickens's success. It was, in fact, almost a piece of literary sleight-of-hand, and everything in the general condition of French fiction at the time of Daudet's appearance on the scene would have warranted the prediction that it would prove impossible. Not very long before, indeed, Janin had tried to make Dickens popular in France, and the only result was that Thackeray was able to hold Janin up to ridicule for the benefit of the English public. Still, this evidence of Dickens's influence on general literature does not help us much, as Mr. Ward says, to judge how long it is likely to last, for a literary fashion which seems for the time to change the face of literature, may suddenly disappear as completely as if it had never existed. What, for instance, has become of the "Romantic School," whether in prose fiction or the drama? Victor Hugo survives, but he is little more than a monument of its ruin, and of the triumph of Realism. The temporary though widespread influence of Dickens cannot therefore be regarded as indicative of his permanent reputation.

Again, it would, as Mr. Ward points out, be an entire mistake to imagine that any future generation can find in 'Oliver Twist' or 'Nicholas Nickleby' everything that the first readers of these novels found in them. Much that constitutes the broad background of Dickens's stories is wholly gone. The Fleet, the Marshalsea, indeed, a great part of the London of his day, is already swept away. The life from which he drew his characters is in great measure gone too, as Mr. Ward might have pointed out. Any one may see, by looking at a few of Cruikshank's familiar plates, that they would not serve even as caricatures of contemporary London life. It is probably safe to say that as England has more and more during the last fifty years felt the influence of the great levelling democratic wave, human character there has lost more and more of its grotesque individuality. The edges of it have been blunted; mankind has become more reserved and shy of showing peculiarities with the freedom of our old friends Sairey Gamp and Betsy Prigg, and Tony Weller and Sam, and Mr. Pickwick, and the rest of the company. The very occupation which produced Tony is gone, and the type is no longer recognizable as taken from real life. The Mr. Pickwick of to-day has lost Mr. Pickwick's naïf simplicity, or is ashamed to show it, and Sam's familiar intercourse with his master would now be rendered impossible, partly by the latter's dread of servants, which Thackeray first pointed out to be one of the marked peculiarities of modern life, and partly by his own increased sense of dignity and equality. In 'Martin Chuzzlewit' Dickens produced what was a painfully good caricature of American society as he saw it; but in this country the changes have been so great as to make large parts of it now seem flat, and probably it is not unfair to say that there was about the same relation between the American part of 'Martin Chuzzlewit' and the American society of the first half of this century as there was between 'Oliver Twist' or 'Nicholas Nickleby' and the England of Dickens's early life. The world which those books painted at the time in such bright and living colors is gone, and for that, though it is unfair to hold Dickens accountable, his reputation must gradually suffer.

Mr. Ward undertakes to vindicate Dickens from the charge of being a "self-made" writer, but his success is not great. Dickens's novels and letters show him to have had some acquaintance with Goldsmith, Fielding, Smollett, and the British essayists. He was also an "attentive and judicious student of Hogarth," but in the nineteenth century a writer of prose humorous fiction could hardly have been less thoroughly equipped for his task than this. The evidence that Dickens in his treatment of his subjects was influenced by the English classical novelists is very slight. Mr. Ward, who is occasionally disqualified for his task by a determination to be too subtly critical, cites a passage from 'Martin Chuzzlewit' as being "pure Fielding": "It was morning, and the beautiful Aurora, of whom so much hath been written, said, and sung, did with her rosy fingers nip and tweak Miss Pecksniff's nose. It was the frolicsome custom of the goddess, in her intercourse with the fair Cherry, to do so; or, in more prosaic phrase, the tip of that feature in the sweet girl's countenance was always very red at breakfast time." This jumble of the heroic in style with the commonplace and vulgar in substance may have been introduced into English prose fiction by Fielding; but it has so long been anybody's trick that it is hardly safe in Dickens's case to make his study of Fielding the cause of it.

Whatever he owed to other writers, it was, Mr. Ward admits, "but little in comparison to his natural gifts." We should be willing to go further, and to say, almost nothing. First among these gifts, of course, come his humor and pathos, which, according to Mr. Ward, were "twin products" of his "sensibility"; though how any appreciation of their literary value is advanced by fathering them upon this latter quality, which is almost as indefinite as intellect itself, we do not see. What we want to get at is the quality of the humor and pathos, for as to its existence there can be no doubt; and here Mr. Ward suggests—though he does not himself see the bearing of the suggestion—the solution of the problem.

"But Nature," he says, "when she gifted Dickens with sensibility, observation, and imagination, had bestowed upon him yet another boon in the quality which seems more prominent than any other in his whole being. The vigor of Dickens—a mental and moral vigor supported by a splendid physical organism—was the parent of some of his foibles; among the rest, of his tendency to exaggeration. No fault has been more frequently found with his workmanship than this; nor can he be said to have defended himself very successfully on this head when he declared that he did 'not recollect ever to have heard or seen the charge of exaggeration made against a feeble performance, though in its feebleness it may have been most untrue.' But without this vigor he could not have been creative as he was; and in him there were accordingly united with rare completeness a swift responsiveness to the impulses of humor and pathos, and inexhaustible fertility in discovering and inventing materials for their exercise, and the constant creative desire to give to these newly-created materials a vivid plastic form."

Now, this tendency to exaggeration in Dickens enables us to make a pretty good guess as to the permanence of his literary reputation. Many kinds of humor profit by exaggeration. The secret of caricature lies in knowing where and how to exaggerate; and Dickens's humor was the humor of caricature. Take exaggerated humorous character out of his works, and what would be left? The plots are poor, except in the case of the 'Tale of Two Cities,' which if it stood alone would have shown Dickens to be a wonderfully clever man, but nothing more; the moral lessons taught in them are trite, and the sentiment commonplace. It is the humorous characters that make the novels live, and they were the result of studies by an observer as keen as ever set himself to the depiction of the mental peculiarities and eccentricities of his fellows. The low London life with which his boyhood had made him familiar, was full of character, and he saw it all. Society—the upper classes—was as a sealed book to him, which he never had an opportunity of taking down from its shelf till his fame was matured and his habits of observation fixed. But the London types of his childhood he thoroughly understood, and with a fund of animal spirits and sympathy, which of themselves almost amounted to genius, and a power of humorous exaggeration such as has been shown by no other writer of our time, he poured forth the most delightful series of caricatures that the world has ever seen. But the very exaggeration which helped his humor ruined his pathos. Exaggerated pathos is a contradiction in terms, and the exaggeration is sure to be detected sooner or later. It is certainly a very puzzling thing that Dickens's pathos should not have struck the public of his own day as a caricatured pathos, laid on with a very thick brush. It does strike most people so now,

even those who most delight in the inconsequence of Mrs. Gamp and the riotous imagination of Jingle. But whatever the explanation of this improvement of taste, we cannot escape it, or allow any one to persuade us, as Mr. Ward attempts to do, that Dickens's pathos will ever be regarded as one of his permanent titles to fame. That he is sure of rank as one of the great humorists of this century cannot be doubted. His humor, was, however, to a very great extent the humor of external observation and exaggerated description of types which are disappearing or have already gone. Of the humor which grows naturally out of character, and of which Thackeray is so full, Dickens had little perception; and this fact necessarily sets limits to the popularity of his works. It is difficult to conceive of even the best caricatures having a permanent place in literature.

Men and Books; or, Studies in Homiletics. Lectures Introductory to the Theory of Preaching. By Austin Phelps, D.D., late Bartlett Professor of Sacred Rhetoric in Andover Theological Seminary. Charles Scribner's Sons. 1882.

THE twenty-two lectures in this volume resemble the lectures contained in Professor Phelps's 'Theory of Preaching' in that they retain their original form and style as prepared for lecture-room delivery; but they differ from the latter in being much less formal, much more free and easy in their general structure, and consequently much better adapted to arrest the attention of the general public and excite its interest. The contents of the book are unequally divided by the "Men" and "Books" which appear upon the title-page; the first six lectures treating of the one, the last sixteen of the other. Those upon "Men" are a succession of forcible and manly pleas for a fair amount of worldliness, properly understood, in the clerical character and experience. The preacher who secludes himself from the ordinary interests of mankind, who does not keep himself well informed concerning the common affairs of business, and politics, and social life, is very apt to prove himself a fool when he is suddenly compelled to meet some practical emergency. Then, too, the chances are that the preaching of a recluse will be entirely inappropriate to the needs of his particular congregation. Here, by the way, Coleridge's famous saying, "If I were a preacher in Cornwall, I would preach fifty-two Sundays a year against wrecking," is sadly spoiled in the quotation. Professor Phelps's advice to the clergy to read what other men are reading is pertinent to his general purpose; but the incidental remark that Scott's novels bankrupted his publishers is far from being true to the actual circumstances of the case. In treating of the relation of the clergy to reforms, Professor Phelps is wiser than his generation; in the anti-slavery struggle the clergy did not take the course which he advises. They were generally "hind-captains." He is weak, however, in his justification of Trendlenburg and Hengstenberg in their defence of Bismarck's policy of blood and iron. But he concedes that this action on their part has been a fruitful source of German infidelity.

Professor Phelps's lectures upon Books are not intended to be general in their character, but to treat of literature in its relations to ministerial culture and activity. They are remarkable for their catholicity. If the hundreds of young men who listened to them went away from Andover and settled down to exclusively theological reading, their dust cannot be mountains on Professor Phelps's head. The course of reading which he advises is inclusive of all the greatest names of ancient and modern literature. He is a lover of the novelists and poets as well as of the theologians and critics; and his love of the best literature generally is so hearty that it would seem that it must have been contagious. Many a young man must owe to Professor Phelps a debt of gratitude for his introduction into Chaucer's world, or Bacon's, or Dante's. His very dogmatism is impressive and inspiring. But some of his judgments will not bear a close examination, as, for example, where he says: "In prose fiction Walter Scott and Charles Dickens are the only names which deserve to precede that of Cooper." His American bias is plain in this judgment and in many others. In a chapter on American theology it is made evident that Dr. Newman Smyth would have been a very natural successor of Professor Phelps's chair. He frankly says of the New England theologians:

"The system they framed was *not* Calvinism, as Calvin taught and preached. They started with the claim that theology is an improvable science, and they ended with the claim that they had improved it. They claimed to have evolved more completely and symmetrically than Calvin had done the spirit of the Scriptures, and to have made the Scriptural faith appear more reasonable and more accordant with the necessary beliefs of the human mind."

But the New England theologians do not please him altogether. Jonathan Edwards's famous Enfield sermon, "Sinners in the hands of an angry God," meets with his flattest disapproval. His opinion of Emerson is not relevant to this particular aspect of his thought, but is made more interesting by Emerson's recent death: "His is a diseased mind, and the world is sure to find it out. Some of you will live to witness a change of literary opinion of him not unlike that which has overtaken the literary fame of Byron. . . . Pure as his private life is, it is impossible for his intellect to be great and true literary seer [*sic*] so long as he hesitates whether or not to apply to the being of God the personal pronoun." Is not Professor Phelps too hard on the young minister on whose table he found a book of three hundred duodecimo pages on the culture of poultry, while he had never read the 'Faerie Queene'? We are acquainted with a minister of moderate salary whose family consumed twenty-five hundred eggs, laid by his own hens, in one year. Thus he was enabled to live and preach the Gospel. He, too, has a book on the culture of poultry, and the 'Faerie Queene' would not have served his purpose half as well.

Lose Blätter aus dem Geheim-Archive der russischen Regierung. [Stray Leaves from the Secret Archives of the Russian Government.] Ein aktenmässiger Beitrag zur neuesten Geschichte der russischen Verwaltung und Beamten-Corruption. Leipzig: Duncker & Humblot. 1882.

THIS little book of revelations is probably the most curious of all authentic publications of the kind issued since the death of Alexander Hertzen. Its authenticity is warranted not only by the character of the publishing house under whose auspices it anonymously appears, but by internal evidence of the most striking nature. We find no clew to its authorship, but doubt not that it comes, directly or indirectly, from a person of high standing in the innermost spheres of imperial power at St. Petersburg. Julius Eckardt, the able writer of so many anonymous books on modern Russia, may possibly have had editorial control of it, though the smoothness and chasteness of the style—qualities which but seldom mark the pages of the Livonian author—militate against this supposition. The facts communicated in the 'Lose Blätter'—which would be startling in a high degree were we not long prepared for the worst in listening to accounts of Russian corruption—are selected with a discriminating eye to accuracy and general importance, and not with a special regard to piquancy. In fact, personalities are rather avoided, and, excepting the chapter devoted to the doings of the Ministry of the Navy, under the special and all-powerful control of the Grand Duke Constantine Nikolayevitch, late Admiral-General of the Empire, a kind of thin veil is charitably thrown over the personal interference of the highest participants in the transactions described. Public gossip and court talk are entirely excluded, and no woman is made to appear behind the scene. That the Grand Duke Nicholas, like Constantine a brother of the late Czar, and commander-in-chief in the Bulgarian campaign, is badly implicated, in spite of the care with which almost all individual delinquencies are charged to account of offices and organizations, is owing chiefly to the circumstance that the largest and most important division of the book consists of a secret report, presented to Alexander II. by the Comptroller-General, on the management of the Army in the Turkish war of 1877—a war in which Nicholas Nikolayevitch figured so lamentably as a general and so scandalously as a prince.

This report—a most remarkable document—is copied from the secret archives of the Court, and most of the author's communications are extracted from similar secret reports. The office of Comptroller-General—or, properly, Comptroller of the Empire—is one of the most important in the governmental machinery of the Czar. He belongs to the committee of state ministers—a cabinet proper does not exist in Russia—has the right to examine into the affairs and money accounts of all the departments, excepting the Ministry of the Imperial Household; receives the reports of subordinate courts of control throughout the empire; communicates with each Minister separately or with all collectively, as well as with the Imperial Council; and reports directly to the Emperor. The Comptrollers-General Tatarinoff, Abaza, Greigh, and Solski, who successively occupied this office during the last decade of the late reign, all enjoyed their master's confidence, and the reports of the last two, from which the contents of the pages before us are mainly drawn, surely deserve credit for bold and explicit statements of fact and terse remarks of a general and prospective character. It is almost sickening to see the affairs of one of the greatest monarchies of the globe *constantly*—though, of course, not exclusively—carried on on the plan of such "statesmen" as Tweed and Sweeny; its quartermaster and commissary departments *throughout* a most momentous war managed in the way which was familiar to us in the palmy days of shoddy contractorship in 1861; its transportation *for the men in the field* executed with the fidelity of our Star-route managers; its naval management putting to the blush the squanderers of our marine resources under the Robeson régime; many of its public buildings, docks, railroads, and war-vessels constructed at rates rivalling the expenses of the New York Court-house. It is melancholy to read the brief, timid, despondent interjected remarks pencilled on the margins of the secret reports by a ruler eager to reform the public service, but impotent to break through the meshes of a spoils system embracing every organization in his vast dominions. Alexander II. was as much a victim of official corruption in his reign as he was of Nihilism in his death. And there is no doubt that Nihilism draws its sap as much from corruption as from tyranny. All these national diseases mutually nourish and develop each other.

Eighteenth Century Essays, selected and annotated by Austin Dobson. London: Kegan Paul, Trench & Co. 1882. Pp. xxiii.–284.

THIS delightful little book contains the cream, the *dessus du panier*, of the numberless essays on human frailties and foibles, on costumes and on customs, and on manners in general, put forth in the century which was most prolific in the true essay, and in which the true essay is perhaps seen in its highest perfection. It contains the best of the more humorous sketches of social life and character lightly limned for us by Steele and Addison, by Johnson and Goldsmith. As we turn its pages we are astonished at the freshness of these portraits from life, these jibes at passing vanities. As Mr. Dobson puts it, "the frivolous chatter of the Syracusan ladies in Theocritus is still heard at every Hyde Park review," and "the Crispinus and Suffenus of Horace and Catullus still haunt our clubs and streets"; and so the Will Wimbles and Beau Tibbses of the essayist are men whom we are wont to greet daily. It is needless at this late hour to praise these portraits, or to declare their charm; but one may venture to say that the Horatian quality in the eighteenth-century essayists has never been shown so clearly before as in the present volume. The freshness of the essays is scarcely more remarkable than the skill with which they have been chosen. There is not one too many or too few. Very quaint also and pleasant is the eighteenth-century air which Mr. Dobson has managed to impart to the volume: it has a rubricated title-page with many rules across it and a Latin motto; it has that "one needful and indeed indispensable Detail, the Dedication to an Illustrious Personage"; it has an admirable frontispiece, a bold drawing of the Tory fox-hunter, by Mr. Randolph Caldecott; it has catchwords at the foot of every page; it has notes quite in the eighteenth-century manner and full of curious learning; and it has a prefatory rondeau regretting that now

> "We may not work—ah! would we might,
> With slower pen!"

While the editor has done all we could hope or more, the publishers have done less. The volume is one of the Parchment series, intended to imitate if not to emulate the excellences of the publications of MM. Lemerre and Jouaust. The present volume falls far short of that standard. The registry of the pages, for example, is wofully inaccurate, as a glance at the running head-lines of the introduction will abundantly prove, and the book is put into its parchment covers in a very slovenly manner: the lower edges actually project below the cover.

Faith Victorious, Being an Account of the Life and Labors of the Venerable Dr. Johann Ebel, late Archdeacon of the old Town Church of Königsberg, in Prussia. Drawn from Authentic Sources by J. I. Mombert, D.D. New York: Anson D. F. Randolph & Co.

WE have here the biography of a Lutheran clergyman little known outside of Germany, but entitled to a wider recognition, in the opinion of his biographer, on account of "his commanding intellect, interesting history, and apostolic zeal in the maintenance and vindication of pure and true evangelical doctrine in opposition to the scepticism and deadness of German Christianity in the first third of this century." Here are three counts, and only the last of them is likely to impress the average reader of to-day, be he never so evangelical. Ebel's zeal was surely apostolic, but for traces of a commanding intellect we seek in vain; and however interesting his history may have been to himself and others at the time when he was making it, it has now a remarkably remote and archæological appearance, like to some implement discovered in a kitchen-midden or a lake-dwelling of the primitive peoples. We have lived fast since 1842, when Ebel's labors came to an end in Königsberg. The questions by which he was agitated have given place to others of a profounder nature, and it requires the most strenuous effort to put ourselves imaginatively in the place of those who lived in Ebel's time and helped him fight his battles.

He was born March 4, 1784, and died August 18, 1861. We get the impression of a radiant, beaming personality—of a man living almost exclusively on an emotional plane—affectionate, kindly, but a good hater withal, and exhibiting the *gaudium certaminis* in the fullest measure. In 1839 he was degraded from his archdeaconship, apparently for attempting to conform his teachings too closely to those of the New Testament, but he was charged with the attempt to found a sect. The details of the suit against him are given in a wearisome manner. Dr. Mombert expresses his opinion of the persons engaged in this controversy with much force and freedom: the once distinguished commentator, Olshausen, is set down as "a self-seeker," "a contemptible individual." Deprived of his position, Ebel had many consolations. Indeed, his biography is pleasantest when treating of his life in exile from his beloved Königsberg. In an appendix three of his sermons are given. They are earnest and simple, but not in any way remarkable. It is too much to hope, with Dr. Mombert, that this book will be "a blessing and a joy to all who read it," but some may find in it a feeble satisfaction.

The Vicksburg Campaign, and the Battles about Chattanooga under the command of Gen. U. S. Grant in 1862–63: An Historical Review. By Samuel Rockwell Reed. Cincinnati: Robert Clarke & Co. 1882.

THE theory of this book, reiterated on every page, is that the soldiers of the war of 1861–65 were all-wise and their generals all-foolish; that the soldiers brought the war to a successful conclusion by their unaided efforts, while the generals perversely threw every obstacle in their path for four long years; that our Army, in short, was such that it needed no head or direction, and suffered greatly from such direction as was imposed upon it. For many ages people have thought and written that an army without a head was a mob; that the best soldiers that ever lived could accomplish nothing except when intelligently led; that the same troops when commanded by a competent general achieved victory, and by an incompetent one, defeat; and these ideas have even been illustrated by contrasting the disasters which befell intelligent volunteers at Fredericksburg, at Manassas, and at Chickamauga, with the victories achieved by identically the same class of men at Donelson, at Vicksburg, at Chattanooga, at Atlanta, and at Appomattox. But we must now believe that all such ideas are opposed to "the most elementary principles of the art of war," and that the most conspicuous successes followed the most egregious blunders on the part of the generals. Plain people, not versed in the "art of war," will, we fear, ask for more blundering generals of that sort—as Mr. Lincoln, when told that Grant was addicted to drinking, is said to have asked the brand of his whiskey, that he might distribute it throughout the Army. In support of this "most amusing paradox," that an army is best without a leader, the author selects the campaigns of Gen. Grant in the West, from the occupation of Memphis to the battle of Chattanooga, and writes 200 pages of fine, newspaper print to prove, not that Grant made mistakes, as mortal men have ever done, generals included, but that his every move was a gross and signal blunder, and that in all of them there was not one redeeming feature; that Grant's controlling ideas were, "to beat McClernand," "to slaughter his army," "to run away from Vicksburg," etc., etc.

It is the essence of a paradox that it is not amenable to reason, and it would indeed be idle to reason with this book, in which there is neither reason, nor sense, nor justice, nor truth, nor statement to which the intelligent man need give heed. To those who find a pleasure in incoherent abuse of a name that others respect, this book will be welcome; but those who believe, as did the vast majority of the Army and the loyal people of the North, that the very operations at Vicksburg and Chattanooga which are here described as foolish blunders were the first of the great victories which ended the war, will find little to interest them in these long pages of incoherent, carping criticism.

BOOKS OF THE WEEK.

Abel, C. Linguistic Essays. London: Trübner & Co.

Banks, Mary R. Bright Days in the Old Plantation Time. Boston: Lee & Shepard. $1 50.

HENRY HOLT & CO., New York.

ELIANE.

A Novel. From the French of Mme. AUGUSTUS CRAVEN.

"'Eliane' is interesting, not only because it is such a record of the best kind of French life and manners as could only have been written by a person thoroughly at home in the subject, but also because of the delicate drawing of character which it contains. The book is quiet in tone, and may fail to please readers who care for nothing but incident; but there are, it may be hoped, still many readers to whom its grace and fine style will recommend it."—*London Saturday Review, June* 3, 1882.

1 vol., paper, 50 cents; cloth, 90 cents.

WILLIAM S. GOTTSBERGER, Publisher,
No. 11 Murray Street, New York.

*IN any family, whether large or small, but es*pecially where the number of children is large, a record of the constitutional peculiarities of each one, and the whole course of its physical development in sickness and in health, is certain to be instructive and may prove invaluable. Such a record is Professor J. B. Fonssagrives's 'Mother's Register,' consisting of a series of tables scientifically arranged for brief and convenient entries. A separate volume for boys and for girls. Price, post-paid, 75 cents per volume, or $1 25 for two volumes. Address Publisher of the *Nation*.

NEW YORK, THURSDAY, JULY 27, 1882.

The Week.

WHILE the party chiefs in Washington are looking up new victims from whom they may possibly wring a few dollars to pay their election expenses this fall, and raging against all persons who call in question the morality or legality of such proceedings, the courts are dealing some heavy blows at the practice of assessing office-holders in the only case now before them. A short time since Gen. N. M. Curtis was convicted by a jury under the law in such cases made and provided, and now the Court has refused to grant a new trial, which was applied for on the ground of unconstitutionality of the statute. This, though it will undoubtedly still further cool Mr. Jay A. Hubbell's ardent desire to be a party in a test case with the Civil-Service Reform Association, is probably offset for that worthy by Attorney-General Brewster's decision that Congressmen are not among the Government officers contemplated by the act. The language of the statute was evidently employed loosely by Congress, and therefore it ought to be construed, and probably will be construed by the courts, as liberally as possible to give effect to as much as possible of it. It is quite obvious that if members of Congress can assess anybody they please, the statute, so far as it is intended to protect inferior officers, would be wholly ineffectual. The action of the Attorney-General is, of course, a notification to the district-attorneys throughout the country that they need not trouble themselves about indicting anybody under the act. This is, to say the least, very unfortunate, since what is imperatively needed is a judicial construction of the act. The Attorney-General's idea seems to be that the meaning of the statute is so perfectly clear that it would be a mere waste of time to go into court with it. Some grand jury may yet, however, take a different view of the matter, for fortunately not even an opinion of the Attorney-General can prevent a grand jury from finding an indictment if they desire to do so.

Mr. A. A. Freeman, Assistant Attorney-General for the Post-office, has reviewed the opinion of the Circuit Court in the Curtis case, and his decision has been published in full. He holds that the anti-assessment statute is unconstitutional and void on several grounds, among which the most striking one is that the Constitution does not confer on Congress the power to pass such an act. This is so conclusive of itself that most men would have been content with it; but Mr. Freeman evidently has a cruel disposition, and does not mean to spare the judges who decided the case below. He therefore adds that the act violates "a principle of natural right older than any organized law—the right to use our own in any manner that we may see proper, provided we do not interfere with the rights of others." That this should have been overlooked by the Court seems almost beyond belief, and it is no wonder that Mr. Freeman felt obliged to come out with it. Under ordinary circumstances we suppose he would enforce his decision by mandamus, but he seems to think that this is unnecessary, because the Supreme Court is going to overrule the Curtis case. His exact language is: "I have read the opinion of the Court in the Curtis case. The Court is in error, and the Supreme Court will so hold." But if he has a summary power of redress, is he not bound to exercise it? Has not the humblest citizen the right to have it exercised for his benefit?

The levying of assessments for political purposes has in the first place had the effect of making Mr. Hubbell, of Michigan, famous. This seems to please Mr. Hubbell, for his ambition is evidently rising, and he is intent upon keeping himself before the people. It appears that he wants to succeed Mr. Ferry in the Senate, while Mr. Ferry would be pleased to succeed himself. Mr. Hubbell, therefore, tries to persuade the people of Michigan that Mr. Ferry is not the right sort of man to represent them in the Senate, and to that end he sends to Michigan thousands of copies of a paper called the *Grand Army Journal*, in which Mr. Ferry is violently assailed. Mr. Ferry says in a letter to the First Assistant Postmaster-General that, as he is informed, the *Grand Army Journal* has never been a regular journal at all, but that the number in which he is assailed has been gotten up for the purpose, and is the first number published under that name, and he suggests that it is fraudulently transmitted through the mails as second-class matter, like regular journals. It is suggested also that Mr. Hubbell is carrying on his campaign against Senator Ferry with funds raised by assessment. How much truth there may be in these allegations we do not know; but it is certainly time that inquiry be made not only into the manner in which campaign funds are levied upon public servants, high and low, but into the purposes for which they are employed. It is very probable, indeed it has been shown in some instances, that money collected for the purpose of being used "against the common enemy" was used by one politician or by one faction against another within the same party—not to speak of other instances, in which its employment could not be traced at all. It is to be hoped that Senator Ferry will not rest until he has ascertained whether the *Grand Army Journal* with Mr. Hubbell's bombshell in it was published as a "Republican campaign document," and paid for out of the fund raised by assessments.

John B. Brownlow, a Post-office clerk, has published a letter giving his views of an attempt made by a little Tennessee "boss" named Houk, who happens to be a member of Congress, to prevent his expressing his opinion on the condition of politics in that State. Houk, he says, has been raising money in Tennessee, not to beat the Democrats, but to defeat another Republican, named Rule, for the nomination in his district, and assessing everybody right and left for this purpose. Finding that Brownlow had the audacity to state, in conversation, that he preferred Rule, Houk, to bring him to his senses, wrote a letter threatening to "send him home to work for a living" if he did not keep quiet. Brownlow says, in reply and in print, that he proposes to do just as he pleases; that Rule is a truly good man, while Houk is somewhat like the "heathen Chinee," and, in comparison with his rival, is a "satyr to Hyperion"; that he neglects his duties in Congress, and keeps an "army of office-holders" riding for weeks "over twelve big counties, larger in extent of territory than the combined area of several States of the Union," "insolently dictating to the people the renomination of their little boss, Leonidas Cæsar Houk." Mr. Brownlow adds that rather than outrage decency by supporting him any longer, he would willingly be disfranchised forever. The letter is a good illustration of the absolute desperation which the tyranny of the Machine produces in the minds of its victims. Here is this poor clerk, whose duty it is to look after the mails, and who ought to be as safe from molestation in doing it as any employee of a private merchant in this city, suddenly threatened with the loss of his place for saying that he prefers one man to another for Congress. To defend himself he publishes a torrent of abuse of the boss who does this, coupled with laudation of his opponent, in the hope that the latter may win the fight, and may, out of gratitude, keep him in. What a wonderful system it is!

Senator Frye's proposal of a commission of inquiry into the causes of the decline of American shipping has been seconded by a number of members of Congress; but the work of investigation has already been accomplished with some thoroughness, and with results which are daily attracting the attention, not only of thinkers and economists, but of practical men of business also. Mr. Frye could accomplish his purpose more effectually, besides saving a good deal of time, by sending to every member of Congress a copy of Mr. David A. Wells's 'Our Merchant Marine,' just published by G. P. Putnam's Sons. Without waiting for a commission, Senators and Representatives may learn from this volume just what the situation of American shipping is, and what has reduced it to its present low estate. Even before they read the book they may see at a glance, from the striking diagram which faces the title-page, what a melancholy falling away there has been. Mr. Wells shows, by means of proportionally reduced drawings of the American flag, how the export and import business covered by it has dwindled from 75.5 per cent. in 1855 to 16.2 per cent. in 1881. Whether by 1890 the flag in this comparison will have wholly disappeared, or whether it will gradually expand again until it regains something of its old and

honorable dimensions, is a question for Congress to answer; and it does not need the help of a commission in the matter.

Mr. Wells considers not only causes, but remedies also. Among the latter is one which Mr. Frye's commission probably would be asked to recommend—subsidies. Mr. Wells reinforces his own argument against this quack specific by the authority of the British Postmaster-General Fawcett, who, in a recent review of the subject, says that "there is an essential difference between a postal subsidy and one given on the building of a ship"; that the former is simply a payment for the conveyance of mail matter under certain specified conditions as to time and speed; and that in Great Britain such subsidies are so far from being granted to give English shipping protection against the competition of other countries, "that when a contract for the conveyance of mails is advertised no restriction whatever is imposed upon any foreign vessels competing." Mr. Fawcett mentions the interesting fact that "for some years a subsidy was paid by the English Post-office to a German steamship company for the conveyance of mails from Southampton to New York." This seems to dispose effectually of the familiar contention that the United States ought to hire Mr. Roach and other men on the Delaware to build merchant ships, because Great Britain does the like in regard to men on the Clyde.

The vote in the Senate on Thursday concurring in that clause of the House Tax Bill which removes all the bank taxes except that on circulation, renders it certain that if any bill passes, these taxes will be repealed. A great deal of demagogy was enacted by Senator Voorhees, of Indiana, while the subject was under discussion, but the largeness of the majority (15 to 41) shows that he did not have the effective support of the Democratic members. Whatever influence the banks have in Congress will now be given to secure the passage of the bill as a whole. The repeal of the bank taxes has an importance over and above the question whether these taxes fall upon the banks, or upon the depositors, or upon the borrowers, or upon all three in certain proportions. It is quite certain that if the banks are relieved from this burden, they can issue circulating notes upon bonds bearing a lower rate of interest than heretofore. They can afford to take the new 3 per cents authorized to be exchanged for the extended 5's and 6's (now running at 3½ per cent.), and thus the Government will recover in another form a considerable portion of what is lost by the repeal of the taxes. As the redemption of the new 3's cannot take place till all the 3½'s are paid off, the exchange will carry the national banking system along for three or four years at all events; but it will be incumbent on the next Congress to consider the question how the system shall be maintained, or what shall be substituted in place of it, when all the bonds shall be paid off, or when the procuring of bonds shall become so difficult and costly as to contract the circulation. A generation has grown up since the national banking system was adopted, to whom accordingly it appears that there can be no bank-notes where there are no Government bonds. It will take time and labor to remove this erroneous impression, and for this reason the consideration of measures, whatever they may be, in substitution of the existing system, should not be postponed to the last moment.

Panama Canal building has been going on so actively—on paper—that the enterprise was supposed to have got a discouragingly long start of the Nicaragua scheme. On Friday, however, a new impulse was given to the latter undertaking in the form of a report by the House Committee on Foreign Affairs favorable to a bill "to incorporate the Maritime Canal Company of Nicaragua." By its terms the capital stock is to consist of not less than 500,000 or more than 1,000,000 shares at $100 each—a total of from $50,000,000 to $100,000,000. The canal must be at least 150 feet wide and 28 feet deep, and the locks not less than 600 feet long. The kernel of the scheme is a guarantee by the United States that for twenty years the net annual receipts of the canal shall not be less than three per cent. of the total cost of the work. It is provided, however, that this estimate shall be made upon a cost not exceeding $75,000,000, and that the yearly expenses of maintenance and operation shall not exceed $1,000,000. It is an interesting question how fast the subscriptions would pour in in the absence of this guarantee; but, with the endorsement of a Government whose credit is so good as that of the United States, Mr. Kasson, who made the report, is perhaps justified in believing that, in view of what "nature has herself accomplished" for this one of the ten routes which have been surveyed across the Isthmus, and considering other helpful circumstances, the company may succeed. The bill provides that the Government may use the canal when necessary for the transportation of troops, and may assume its management "temporarily or otherwise" when it sees fit. It is not likely, however, that with a guarantee of annual dividends to the amount of $2,250,000 the company would force the Government to take charge of the enterprise for twenty years at least. Mr. Kasson says that probably the United States will never be called upon to make good its guarantee, and altogether takes almost as cheerful a view of the future of Nicaragua as M. de Lesseps himself takes in regard to Panama. But such predictions are always made, even in cases where the Government finally is obliged to foot the bills.

General Grant has written a letter to the Mexican Minister, Mr. Romero, stating the attitude of the United States with regard to the boundary dispute between Mexico and Guatemala with as much positiveness as if he were himself the head, or rather the embodiment, of the Government of the Republic. He adds, indeed, that he is "not, of course, authorized to say a word for the Administration on this subject." But he is certain to know what it is going to do, and so informs the plenipotentiary of the foreign Power interested in the matter, kindly relieving the President and the Secretary of State of that trouble. General Grant's exploits of private diplomacy in China have already accustomed the people of this country to his eccentricities in this regard, so that a repetition of them appears rather harmless. It must be said, also, that the contents of General Grant's letter are on the whole very sensible, and stand in remarkably wholesome contrast to some of his official utterances as President of the United States. He is especially emphatic on the matter of annexation, telling the Mexican Minister not to give himself any concern as to the offer of territory which President Barrios of Guatemala, as reported, is prepared to make to our Government. "Annexation of territory," says General Grant, "will have but few advocates, and the treatment by the press of the country of such men as advocated interference in foreign countries, shows that any scheme of that kind would be extremely unpopular. . . . I am certain that I know the sentiment of the country on the question of annexation." There are some of us who remember that General Grant, when he had the San Domingo annexation scheme "on the brain," utterly refused to listen to "the sentiment of the country on the question of annexation," and even in his last message reasserted his conviction of the immense advantage of that acquisition of territory, and of the folly of the opposition to it. It is pleasant to observe a capacity to learn, even in elderly and headstrong men.

Shipherd has at length given to the press the testimony which the House Foreign Affairs Committee refused in May last to receive. It contains his correspondence with General Grant, and shows the means by which the adventurer contrived to elevate himself temporarily into the position of a public character. In October, 1881, he sends to General Grant a memorandum of the instructions which he thinks the Secretary of State ought to send to our Minister at Lima, and asks the General to "please say in a word if it seems to you too strong in view of the enormous interests at stake and the critical situation." The instructions embraced the following: "Notify Peru and Chili peremptorily that no adjustment will be allowed which does not provide, to the satisfaction of this Department, for payment of Landreau and adjudication of Cochet claims; and insist on *status quo* meanwhile. Avoid absolutely Société Industriel." This was sent back by General Grant, Shipherd says, with the following endorsement: "The enclosed is what I think the Secretary of State should send, in view of his instructions to Hurlbut and the latter's actions, as I understand the matter. But I can ask nothing and expect nothing from the present Secretary of State." This was, of course, the mere expression of an opinion—a very extraordinary opinion, no doubt—coupled with a refusal to do anything. Still, it appears to have answered Shipherd's purpose, and he probably showed it to all the other statesmen and diplomats who, he says, were associated with him, as containing General Grant's views on the Chili-Peruvian crisis

Mr. Trescot has written a letter to Mr. Blaine in which he makes a benevolent attempt to extricate that gentleman from the awkward position in which the Chili-Peruvian

investigation has left him. He declares Mr. Blaine to have acted in a consistent manner with regard to the Crédit Industriel from the first; that the idea of his "designing a war" is "too absurd for serious consideration"; that in regard to the Cochet claim, he rejected it absolutely; while as to the Landreau claim he merely suggested an adjudication. From this it will be seen that Mr. Trescot takes the Blaine view of the whole affair. What he says is, however, no more than the expression of an opinion as to the proper construction to be put upon certain acts of Mr. Blaine which have all been made public, and as to which Mr. Trescot is no better qualified to reach a conclusion than a thousand other people. Mr. Trescot's reason for thinking that Mr. Blaine could not have intended to involve the country in a war reflects greater credit upon his heart than upon his head. He says that he is quite sure about this, because Mr. Blaine always declared to him that it was not war but peace that he wanted. He would have declined the mission, he says, if he had thought otherwise. The reason why most people think that Mr. Blaine meant war, is that while talking about peace he kept exasperating the Chilians, so that it was obvious that sooner or later they must be forced into war. If, while uttering beautiful sentiments about peace and good-will, you double up your fist and shake it in a man's eyes, and encourage your friends to surround him with loud cries and threats, he will sooner or later come to the conclusion that your intentions are hostile. Mr. Trescot seems to think that it is impossible to say peace and mean war, so that his letter must not only be very satisfactory, but very amusing, to Mr. Blaine.

Judge Wylie's decision to admit Walsh's testimony in the Star-route trial gives the prosecution an important advantage. The decision is limited to holding that testimony of admissions by any one of the conspirators can be received so far as they affect him, but not his fellow-conspirators. Walsh's story is that Brady admitted to him in 1880 that he was in the habit of getting twenty per cent. on "expeditions" from all the contractors, and demanded it of him. The jury will, of course, be instructed very carefully that this affects no one but Brady, as they will be in regard to the "Rerdell confession," which has likewise been admitted. But the rules of law with regard to evidence in conspiracy cases are so elaborate and hard to follow, that probably no jury in arriving at its verdict in such a case ever knows whether it is applying them correctly or not. When a jury once gets hold of a conspiracy case it tries it generally in a much simpler way than any reader of Greenleaf on Evidence would think possible.

The Georgia Democrats, in their State Convention, on the 19th inst., abandoned the "time-honored" two-thirds rule. This rule is time-honored for various reasons. It enables one-third of the body to prevent the nomination of a candidate who is favored by a large majority of the representatives of a party and perhaps also of its members. It used to enable the politicians of the slave States, though in a minority, to control national conventions. It has been said that the two-thirds rule guarantees harmony and promotes enthusiasm. How it does this is not clear, since, as we have seen, it may easily disappoint and exasperate a very large majority of the party, and inasmuch as it often results in the nomination of a candidate whom nobody wants, not even the minority. It is an encouraging sign of progress that the Georgia Democrats have repealed this rule. As regards Mr. Alexander H. Stephens's acceptance of the nomination for the Governorship, it might be asked whether the Democratic Bourbons have come to him, or he has gone to them A similar question might have been asked when Mr. Stephens, as a Union man, cast his lot with the Rebellion. His mind was undoubtedly full of good intentions as to the beneficent influence he was going to exercise, but the Rebellion was much stronger than he, and he did not exercise any influence at all. Some time ago he was spoken of as the candidate of the "Independents" in Georgia, a position for which his expressed or implied opinions would have well fitted him. But, as in 1861 the Secessionists thought it an important thing to capture him as the ablest and most respected Union man in the State, so the Democratic Bourbons have thought it a useful thing to capture the most respected Democrat of an "independent" reputation. The result will probably be the same. If Mr. Stephens had any strong purpose in running for Governor, there would undoubtedly have been some intimation of it in the platform, which was made by a committee composed exclusively of Mr. Stephens's friends, and may have been written by himself. But there is absolutely nothing in it of the least significance unless it be the denunciation of the Government for its efforts to collect internal-revenue taxes in Georgia.

In the Democratic Convention of Ohio the "Young Democrats" seem to have been overshadowed by the old "war horses." This is not surprising, for if the Young Democrats were fairly represented by Mr. Bookwalter, the last Democratic candidate for Governor in Ohio, it is difficult to see what constitutes their claim to political power. There were only three candidates to be nominated this year—one for Secretary of State, one for Supreme Judge, and one for the Board of Public Works. It is reported that the nominations made by the Democrats are uncommonly strong. Their platform is much better than that of the Georgia Democrats, without, however, being very clear and specific. It favors "honest reform in the civil service" and a "tariff levied to meet actual needs," which is also "to encourage productive industries and afford labor just compensation without creating monopolies," whatever that may mean. A resolution opposing "legislation merely sumptuary" is obviously aimed at the German Republicans, who are dissatisfied with the so-called Pond Law and the Sunday Law. The Democrats expect to make large gains in that quarter, and their expectation is to some extent likely to be realized. A significant feature of the Convention was the part played in it by Senator Pendleton, who presided, and delivered what appears to have been the principal speech at a ratification meeting in the evening. In this he ignored civil-service reform almost altogether, and devoted himself principally to crude lucubrations about the foreign policy of this country, apparently trying to out-Blaine Mr. Blaine himself.

The news of the week respecting the crops was the main reason for buoyant and active markets at the Stock Exchange, and for depression and lower prices at the Produce Exchange. This news, in a word, was that the yield of wheat and of every variety of grass crop will be the largest on record, and that the corn crop promises to be but little below the average. The decline in the prices of food products at the Produce Exchange has been somewhat modified by the prospect of an extraordinary foreign demand for them during the coming year, inasmuch as the harvests in Europe are below expectations. All railroad securities were also strengthened by the report of the Advisory Commission appointed by the trunk-line railroads to consider the question of differential rates. The Commissioners favor maintaining the present differences, which are against New York; but the opinion is that the report will be accepted by the New York roads, and that then all differences between the trunk-line roads will be settled on a firmer basis than ever before, and that the policy of the roads will be to get profitable rates instead of to injure one another, as last year. The rise in the prices of stocks ranged from 1 to 17 points; and in railroad bonds, from 1 to 8½. United States bonds advanced ¼@1 for the long issues, and declined ⅛@¼ for the short-date issues. The money market was easy at low rates, although the New York banks lost about $2,500,000 of their surplus reserve. While foreign exchange ruled considerably below the gold-exporting point, about $1,500,000 gold was shipped for the account of the Italian Government. Rates in the London money market remain low, and the foreign demand for American securities was large; one negotiation of $3,000,000 Northern Pacific bonds was made for the German markets.

The accounts of the atrocities committed by Arab ruffians in the interior of Egypt, as they gradually come in, grow more and more horrible, and are calculated seriously to diminish the sympathy with the "nascent nationality" which some discerned in Arabi's movements. There has been some slight skirmishing between the British advance and Arabi's forces, the result of which will probably be the restoration of the fresh-water supply upon which Alexandria depends. The only sign of bravery the Egyptians have so far shown was that their cavalry galloped gallantly forward and then galloped back again as soon as they were shot at. The British are now trying to bring heavy artillery to the front, with which they expect to dislodge Arabi's force from his position near Ramleh, in which place the British have established themselves. The message of the Queen calling out the reserves on account of the difficulties in Egypt shows that the British Government is taking a somewhat more serious view of the obstacles to be overcome than before.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, July 19, to TUESDAY, July 25, 1882, inclusive.]

DOMESTIC.

IN the Senate on Wednesday, Mr. Beck's amendment to the Internal-Revenue Bill, reducing the tax on tobacco to twelve cents a pound, was adopted after a long discussion. The discussion of the bill was made very spirited on Thursday by a reply from Senator Harrison, of Indiana, to his colleague, Senator Voorhees, who recently made a high-tariff speech. Mr. Harrison showed that Senator Voorhees did not truly represent the Democratic party of Indiana by his sentiments on the revenue question. The Committee amendment, removing the bank tax, was adopted. On Friday, snuff was included with tobacco in the tax reduction, and a motion made by Mr. Bayard, of Delaware, to strike out matches from the list of articles from which the stamp tax is to be removed, was lost, by a vote of 8 to 45. The first section, as amended, was finally passed on Saturday.

A proposed amendment to the Revenue Bill, further reducing the tax on manufactured tobacco to eight cents per pound, was lost in the Senate on Monday, by a vote of 18 to 38.

The Senate has refused to confirm D. Lanning, a Stalwart Republican, whom President Arthur nominated to succeed Postmaster Cleveland, at Penn Yan, N. Y. The latter gentleman was removed without sufficient cause. The vote stood 28 to 30, twelve Republicans voting in the negative.

Filibustering began in the House of Representatives on Wednesday, when the South Carolina contested-election case of Tillman and Smalls was taken up by the Republicans. A quorum of Republicans was obtained with difficulty, and, after a speech by Mr. Tillman, in which he openly defended the recent gerrymandering in South Carolina, and did not deny that there had been intimidation of colored voters, his seat was given to Mr. Smalls, the Republican contestant, by a vote of 141 to 5.

The House Committee on Pacific Railroads on Wednesday voted to postpone until December further consideration of the bill to aid in improving the navigation of the Mississippi River, by constructing a levee from Memphis to the Yazoo River.

On Thursday the House declared the seat of Mr. Shelley, a Democratic member from Alabama, vacant, by a vote of 145 to 1. His Republican contestant is dead. The conference report on the River and Harbor Bill was presented. It reduces the aggregate amount of specific appropriations contained in the bill as it passed the Senate about $350,000.

The House Committee on Foreign Affairs made a report on Friday favorable to a bill to incorporate the Maritime Canal Company, of Nicaragua. By its terms the capital stock is to consist of not less than fifty nor more than one hundred million dollars. The United States is to guarantee that for twenty years the net annual receipts of the canal shall not be less than three per cent. of the total cost of the work. The same committee unanimously resolved not to accept a statement from Mr. Blaine in reply to Mr. Robert E. Randall's recent contradiction of Mr. Blaine's previous testimony in regard to the Crédit Industriel.

A minority report of the House Judiciary Committee, presented to the full Committee on Friday, sets forth that the remainder of the Northern Pacific Railroad land grant unpatented to this date should be restored to the public domain, for occupation by actual settlers under existing laws.

A bill providing for the issue of postal notes for sums not exceeding five dollars was passed in the House on Friday. The notes are not redeemable after three months, and the fee is to be three cents. The following reductions were also made in the fees charged for money orders: on orders not exceeding $10, 8 cents; not exceeding $15, 10 cents; not exceeding $30, 15 cents; not exceeding $40, 20 cents; not exceeding $60, 25 cents; not exceeding $70, 35 cents; not exceeding $80, 40 cents; not exceeding $100, 45 cents.

The question of free ships was brought before the House on Saturday in an unexpected manner. Mr. Kasson reported a bill the purpose of which is to extend to vessels built in the United States on foreign account, partly of domestic and partly of foreign materials, the same drawback that is at present allowed on a manufactured article constructed wholly of imported materials—that is, a drawback to the amount of duties paid, less ten per cent. Mr. Tucker, a Virginia Democrat, moved to amend the bill, making it apply to vessels built for domestic as well as foreign account. The amendment was forced to a vote, but the Republicans abstained, leaving the House without a quorum voting. Further dilatory tactics were resorted to by the Republicans until the hour was up, when the bill went over.

In the Criminal Court, at Washington, on Wednesday, argument was begun in the Star-route trials, before Judge Wylie, as to the admissibility of the testimony of John A. Walsh. It was understood that the decision of this question would also affect the admission of the Rerdell confession, and upon this piece of evidence much of the prosecution's success depends. The defence contended that a confession of a fellow-conspirator could not be accepted against an associate; that the confession could not be used against himself until the conspiracy had been otherwise proved; that a confession of acts not done in the furtherance of the objects of the conspiracy could not be received. On Friday Judge Wylie decided that testimony of admissions by any one of the conspirators could be received as far as they affected him, but not his fellow-conspirators. Walsh was then called, and testified as to Brady's admitting to him that he got twenty per cent. on "expeditions" from all contractors, and he demanded the same from Walsh.

The Court in banc of the criminal branch of the United States Circuit Court rendered a decision on Thursday in the case of Gen. Newton M. Curtis, ex-special agent of the Treasury Department, who was indicted for, tried, and convicted of collecting money from officeholders for political purposes. The motion for a new trial and the arrest of judgment was denied, and the validity of the statute upon which the prosecution was based was affirmed. General Curtis was sentenced to pay a fine of $1,000, and stand committed until the fine was paid. General Curtis was committed to the custody of his counsel, who was sworn as a Deputy United States Marshal. The counsel immediately applied to Chief-Justice Waite of the United States Supreme Court for a writ of habeas corpus and certiorari. On Monday they were signed and made returnable before the Supreme Court in October.

The Tariff Commission is now holding daily meetings at Long Branch. The Commission holds an executive session in the morning at eleven o'clock. At two in the afternoon there is a public session, at which those who desire to be heard on the tariff question are given an opportunity. The first point to be considered by the Commission is a free list.

The report of Messrs. Allen G. Thurman, E. D. Washburne, and Thomas M. Cooley, the Advisory Commission selected by the New York Central and Hudson River, the New York, Lake Erie and Western, the Pennsylvania, and the Baltimore and Ohio Railroad Companies, to advise them upon the differences in rates that should exist, both eastwardly and westwardly, upon all classes of freights between the several terminal Atlantic ports, has been published. It sets forth that no evidence has been offered to show that the existing rates are unjust, or that they operate to the prejudice of any of the Atlantic seaboard cities. They, therefore, have no further recommendation to make, except that the whole matter must be left where it is, in the hands of the railroads.

General J. Rufino Barrios, President of the Republic of Guatemala, is now in this country. He went to Washington on Wednesday, and during the week many official courtesies have been extended to him. He hopes to obtain the good offices of the United States in settling the long disputed boundary question between Mexico and Guatemala.

The National Greenback-Labor State Convention, at a meeting in Albany on Wednesday, nominated the following ticket: for Governor, Epenetus Howe, of Tompkins Co.; for Lieutenant-Governor, James Allen, of Brooklyn; for Chief Judge of the Court of Appeals, L. J. McParlin, of Niagara County; for Congressman-at-large, L. G. McDonald, of Glens Falls. The platform adopted reaffirms that of the National Convention of the party in 1880, until the next National Convention adopts another; it calls for reform in the management of railroads by the State, repeal of certain sections of the penal code, and the regulation of prison labor; it asserts that all land owned by individuals or corporations in excess of what is required for their personal use, or for the transaction of business, should be taxed so as to render its ownership valueless.

The Regular Republican Executive Committee of Pennsylvania, to whom was referred the proposition of the Independent candidates for the absolute withdrawal of both tickets from the field, have written a letter stating that the difference between the Independent candidates is so wide that it practically bars any further attempt at negotiations on the basis they propose. They further state that their four propositions exhaust the powers granted them by their Convention. This virtually puts an end to all efforts at compromise, and it is probable that the war between the factions will be fought out in the campaign.

The State Convention of the Ohio Democrats was held on Wednesday and Thursday, and J. W. Newman, of Portsmouth, was nominated for Secretary of State, John W. Oakey for Supreme Judge, and Henry Weible for Board of Public Works. The platform contains a vigorous denunciation of political assessments, and a plea for civil-service reform; it favors a tariff levied to meet actual wants, a bi-metallic standard, anti-monopoly legislation, and a more ardent protection of American citizens in foreign lands. Senator Pendleton, of Ohio, spoke at a ratification meeting on Thursday evening. He devoted himself especially to a denunciation of the foreign policy of the present Administration, and favored extending the influence of the United States among the nations of the American Continent.

In the Georgia Democratic Convention, on Wednesday, the majority rule was adopted, by a vote of 195 to 164. Alexander H. Stephens and A. O. Bacon were put in nomination for the Governorship. On Thursday morning Mr. Bacon's name was withdrawn and Mr. Stephens was nominated, there being only eight scattering votes against him. The rest of the State ticket was then nominated, and a platform adopted which reaffirms the principles of the Jeffersonian Democracy; charges the present National Administration with a corrupt use of the Executive patronage; and condemns the present mode of raiding upon illicit distillers.

The Texas Democrats have nominated John Ireland for Governor. He is a practising lawyer of considerable reputation, and has served as State Senator and Supreme Judge.

A decision of the Connecticut Supreme Court, on Wednesday, establishes the eligibility of women to be admitted to practice in the courts of the State.

An earthquake shock of ten seconds' duration was felt in Cairo, Ill., on Thursday morning.

At half-past two o'clock on Wednesday morning the steamer *Rhode Island*, of the

Providence line, was run into by the *Alhambra*, of the New York and Halifax Steamship Company. The *Alhambra* struck the *Rhode Island* on the port side, and tore out the wheel-house and some of the upper works, completely demolishing the wheel. The only person injured was the colored barber of the *Rhode Island*, who was asleep in his chair. He was crushed into a very small space, and so hemmed in by timbers that it was necessary to cut him out. His injuries were not fatal.

The widow of Abraham Lincoln was buried in the Lincoln tomb at Springfield, Ill., on Wednesday. The officers of the State of Ohio attended the funeral in a body.

Miss Fanny Parnell, sister of Charles Stewart Parnell, the Irish leader, and granddaughter of Commodore Charles Stewart, known as "Old Ironsides," died suddenly of heart disease on Thursday, at the family home in Bordentown, N. J. She was twenty-eight years of age. Many branches of the Ladies' Land League in this country were organized by her.

Col. John Church Hamilton, a son of Alexander Hamilton, died on July 25, at Long Branch, in the ninetieth year of his age. He was the editor of Memoirs and the Works of his father, and wrote a 'History of the Republic,' which was published in 1858.

FOREIGN.

It became evident on Wednesday that the work of the British fleet at Alexandria was about ended, and that thereafter land troops would be needed to carry on the campaign. The ships of the reserve squadron were ordered to return to their several stations. Dervish Pasha left Alexandria for Constantinople, and the British felt relieved at his departure, for it was believed that he acted in collusion with Arabi Pasha, and it was asserted that he received a communication from him but a few hours before starting for Constantinople. Arabi Pasha's defence, which was published in Constantinople, maintained that the bombardment of Alexandria was a hostile act to Egypt, and contrary to the rights of the Sultan; and that he was fully justified by law and by the decision of the Council of Ministers in replying to the British fire. The Khedive, he argued, in accepting British soldiers as a body-guard, showed that he considered the Egyptian Army as enemies. The delay of the British troops gave encouragement to Arabi, and his forces increased rapidly.

Arabi Pasha continued his aggressive operations on Thursday. Having erected fortifications just opposite Abukir Bay, and upon the Mahmudieh fresh-water canal which supplies Alexandria, he placed a dam in the canal below his position, and cut the banks above the dam so as to send water along the front of his fortifications. Sufficient water remains in the canal below the dam to supply Alexandria for about three weeks. The country in front of Arabi's defences is flooded knee-deep, making the ground too soft for the movement of guns. Arabi secured his forces after the battle at Alexandria by spreading a report that the English had been defeated, and that eight iron-clads had been sunk, two burned, and four captured. He also issued a proclamation, announcing irreconcilable war with the English. The Notables supported Arabi by meeting at Cairo, declaring the Khedive a traitor, and deposing him. Arabi has levied a war-tax upon the land to the amount of $2,500,000. He is well supplied with provisions and ammunition.

Major-General Alison on Saturday morning moved out from Alexandria with two regiments of infantry and a mounted squadron toward Arabi's entrenchments. These troops occupied Abukir. Two hundred and fifty rifles, under an aide-de-camp of General Alison, pushed beyond Milaha to blow up the railway. They met some of Arabi's cavalry, and several shots were exchanged. The Egyptians fled after losing two dead and several wounded.

The Khedive published, on Sunday, two proclamations, one to Arabi Pasha, dismissing him formally from the Ministry of War, for his persistency in war preparations and his refusal to go to the Khedive after receiving orders; the other is a proclamation to the Army, calling on them to abjure Arabi's authority, and obey the Khedive. In reply to the proclamation, Arabi appointed a Minister of his own at Cairo. It is thought probable that he will destroy that city unless defeated. His force was estimated on Monday at 8,000 men, thirty-six field pieces, and six Gatling guns.

Refugees flocked to Alexandria on Sunday and Monday from the interior and from Cairo. Horrible reports were brought of the atrocities committed. At Tantah, eighty-five Europeans were tortured and torn in pieces; women were violated and tortured. At Tulkh, the throats of two Germans were cut as they were about to enter a railway carriage. Soldiers have participated in the outrages, but Arabi's Government has issued a proclamation that every native molesting Christians will be shot. This is thought to be a mere form which may give them immunity if they should fall into the hands of the Europeans hereafter. Ragheb Bey was arrested on board a mail steamer from Constantinople, at Alexandria, on Sunday. Papers were found in his possession which showed that he had been acting as Arabi's agent for carrying communications between him and the Palace and Pan-Islamic Committee at Constantinople. He was promised lenity if he confessed, and he gave a complete list of the persons with whom Arabi has been connected, both in Constantinople and Egypt. It is rumored that Arabi has threatened to depose the house of Osman, and proclaim that of Yezid ruler in its place.

The Sixteenth Rifles (English) marched from Alexandria to occupy Ramleh on Monday morning. Arabi's front fell back on Sunday evening to the other side of Ramleh, forcing this operation. The British troops stationed one Gatling and a field gun at the bridge over the canal. The enemy's cavalry appeared and galloped along the railway at three hundred yards' range, but fled at the first volley from the guns. They afterward reappeared with two guns and opened fire with little effect on the British troops. By three o'clock in the afternoon the fighting was finished. The casualties were insignificant, and the British troops remained in occupation of Ramleh.

M. de Freycinet, the French Premier, in conference with the Senate Committee on the Naval Credit, on Monday, said that if the Powers indirectly interested in Egypt remained neutral in regard to the intervention in Egypt, France would leave England to act alone, and would confine herself to the protection of the Suez Canal.

On Thursday the Porte replied to the identical note of the Powers in regard to the despatch of Turkish troops to Egypt as follows: "If the Porte has not hitherto decided on its own initiative to send troops to Egypt, it is because it was convinced that vigorous measures were avoidable. Observing with satisfaction that the Powers have formally and repeatedly recorded their deference to the incontestable and unquestioned rights and sovereignty of the Sultan, the undersigned, by the Sultan's order, informs the Ambassadors that the Porte consents to participate in the Conference." The Ambassadors of the Powers at Constantinople, in view of the importance of again asking the Porte to join the Conference, telegraphed to their respective Governments, asking speedy instructions. On Friday the Sultan appointed Assym Pasha and Saïd Pasha as Turkish delegates to the Conference.

A long despatch from Earl Granville, English Foreign Secretary, to Lord Dufferin, the English Ambassador at Constantinople, dated July 11, has been published. After justifying the bombardment of Alexandria, the despatch asserts that England's Government now sees no alternative but a recourse to force to put an end to the disorders in Egypt. If the Sultan will not furnish the force, Her Majesty's Government holds that the intervention should represent the united action and authority of Europe.

One hundred Conservative Peers met at Lord Salisbury's residence in London on Friday and decided to allow the Irish Arrears Bill to pass its second reading in the House of Lords, but to introduce amendments to the bill in Committee. The proposed amendments will not touch the question of loan or gift, but will provide that application for dealing with arrears shall be optional for both landlord and tenant, and the tenant's right of holding shall be considered an asset. Lord Salisbury, on account of the gravity of foreign affairs, did not recommend the rejection of the bill, and a consequent crisis.

The House of Commons on Friday passed Mr. Trevelyan's new clause to the Arrears Bill to its second reading. It provides that Boards of Guardians shall have power to borrow money at 3½ per cent. to promote emigration. The bill then passed its third reading.

Colonel Brackenbury, Director of the Irish Criminal Investigation Department, has resigned. He has not been able to work harmoniously with the Lord Lieutenant.

Crops in the northwest of Ireland are in a very bad condition. Hay is lying cut in the fields, surrounded by water, and potatoes are blighted.

Mr. Bradlaugh and three other freethinkers were committed for trial on Friday, in London, on the charge of publishing blasphemous libels. Mr. Bradlaugh was afterward admitted to bail in the sum of $500.

It is reported in London that Mr. John Bright will visit America during the Parliamentary recess.

In London, the prospectus has been issued of the European, American, Canadian, and Asiatic Cable Company, with a capital of $7,500,000. It proposes to work at the rate of nine pence a word.

The rifle team of England won the Elcho Shield in the competition at Wimbledon, England, on Thursday. Ireland was 31 points behind England, and Scotland 11 points behind Ireland.

In the French Chamber of Deputies, on Wednesday, M. Goblet, Minister of the Interior and of Worship, replying to a Radical interpellation, demanding the establishment of a central Mayoralty for Paris, moved the order of the day, pure and simple, which was rejected, by a vote of 278 to 172. The Chamber adopted, by a vote of 218 to 176, an order of the day hostile to the creation of a central Mayoralty. In consequence of these votes, Premier de Freycinet placed the resignations of himself and colleagues in the hands of President Grévy, who urgently begged them to withdraw them. On Thursday several Deputies declared in the Chamber that their votes were not aimed at the Cabinet. M. Ferry stated that President Grévy would not accept the resignations. The Chamber finally passed, by a vote of 276 to 105, an order of the day implying confidence in the Government, and leaving aside the Mayoralty question. This ended the crisis. M. Goblet resumed his post, but said he would not abandon any part of his programme.

M. Floquet, Prefect of the Department of the Seine, France, and a great partisan of the Paris Mayoralty, resigned on Friday. The resignation has not yet been accepted.

Mr. George P. Marsh, the eminent philologist, for twenty-one years the United States Minister to Italy, died suddenly in Vallombrosa, Italy, on Monday, at the age of eighty-one. He was the senior member of our diplomatic service.

A great fire at Smyrna, on Wednesday, destroyed 1,400 houses, and rendered 6,000 people homeless. Only one life was reported lost.

THE DECISION IN THE CURTIS CASE.

THE three judges of the Circuit Court, in sentencing General Curtis for levying assessments on Government employees, place their decision on grounds so broad as to strike at the root of the abuse. The act under which General Curtis was indicted prohibits "all executive officers or employees of the United States not appointed by the President, with the advice and consent of the Senate," from "requesting, giving to, or receiving from any other officer or employee of the Government any money, or property, or other thing of value for political purposes." Now, the Court says that it "cannot profess to be ignorant" that the law was passed for the express purpose of preventing the continuance of "practices which had become a topic of extended animadversion," and the first question raised by the defendant was, whether Congress had the power to prevent them by such means. He insisted that Congress has no constitutional power to make the requesting or giving of voluntary contributions for political purposes a criminal offence. The Court disposes of this defence very effectually by calling attention to the fact that the prohibition applies only where there is "concerted action between officials." It is, in other words, a gift by one official to another, or a demand by one official upon another, which is prohibited, not donations by or demands upon private persons.

The right of Congress to make regulations for the discipline of the public service cannot be questioned, and Congress must necessarily exercise its judgment and discretion in determining what acts have a tendency to impair discipline. With this discretion courts of justice cannot interfere unless it has been plainly transgressed—*e. g.*, should Congress undertake to prohibit "an act of a nature pertaining so exclusively to the sphere of private conduct that it could not by any implication impinge upon official deportment or official discipline." But the acts prohibited by this statute are not of such a character. "We cannot affirm that Congress transcended its discretion in prohibiting transactions between officials which create the relation of donor and donee, and introduce party interests into the public service; nor that Congress erred in assuming that the influences springing from this relation and these interests should be discouraged as liable to deflect the independence and impartiality which must rule official intercourse." As an instance of this sort of legislation, the Court cites the act of February 1, 1870, prohibiting employees from making gifts to their superior officers. It is not necessary, the judges say, that the coöperation of officials in raising funds for political purposes should be essentially "subversive of discipline." It is enough to justify the exercise of the legislative discretion "if the prohibited acts *tend to introduce interests* which disturb the just equipoise of official relations." As to the "right and duty of every good citizen to aid in promoting such political objects as he deems to be wise and beneficial," the Court further says: "The answer is that no citizen is required to hold a public office, and if he is unwilling to do so upon such conditions as are prescribed by that department of the Government which creates the office, fixes its tenure, and regulates its incidents, it is his duty to resign."

No one who wishes to see the public service of the country managed on rational and honest principles can fail to be greatly encouraged by this decision; but it has to be looked at in connection with the opinion which has just been given by the Attorney-General, to the effect that members of Congress are not "officers" of the Government within the meaning of the act, and consequently employees are not forbidden by it to pay the assessments levied upon them by Mr. Hubbell and his committee.

The gist of the Attorney-General's opinion may be gathered from the following extracts:

"It seems that a member of Congress is not an officer of the United States in the constitutional meaning of the term. In the case of Blount, on an impeachment before the Senate in 1799, the question arose whether a Senator was a civil officer of the United States within the purview of the Constitution, and the Senate decided that he was not. This question arose under the fourth section of the second article of the Constitution. 'Other clauses of the Constitution,' observes Judge Story in Section 733 of his work on the Constitution, 'would seem to favor the same result, particularly the clauses respecting appointments of officers of the United States by the Executive, who is to commission all of the officers of the United States; and the sixth section of the first article, which declares that "no person holding any office under the United States shall be a member of either House during his continuance in office"; and the first section of the second article, which declares that "no Senator or Representative or person holding an office of trust or profit under the United States shall be appointed an elector."' To these clauses may be added that in the section of the fourteenth article which provides that 'no person shall be a Senator,' etc., who, having previously taken an oath as a member of Congress or as an officer of the United States, etc.

"These clauses show a marked discrimination between members of Congress and officers, the latter term, in the sense in which it is there used, not including legislators.

"In the penal legislation of Congress a like discrimination is made. . . . In legislation of this character the word 'officer' appears to be uniformly employed in a sense not more comprehensive than that in which it is employed in the Constitution as above; that is to say, not in that broad and general sense which would include members of the legislative branch of the Government."

This cannot be considered as conclusive. It is surprising to find a lawyer of Mr. Brewster's standing citing the Blount case as a precedent; for, in the first place, the record of his trial does not make plain on what ground the decision should be placed, and the difference between a Senator, an officer chosen by a State, and a Representative, whose office is entirely Federal, is very wide.

As to the citations of statutes in which the word is used in such a way as to show that members of Congress cannot be intended, other acts, as, for instance, the Test Oath Act, and the act of 1874 "repealing the increase of salaries of members of Congress and other officers," are in conflict with these, and have been called to the attention of the Attorney-General by the counsel for the Civil-Service Reform League. The reason why he is silent about them is very obvious. Had he referred to them, he would have been obliged to admit that the question is by no means clear, and that it is really one for the satisfactory settlement of which judicial construction is required.

Still, whether the Attorney-General is right or wrong, the important result of the Curtis case is that the practice of collecting political assessments has been judicially determined to be an abuse. Whether the language of the present act prevents the penalty being enforced if the assessments are levied by members of Congress cannot affect the principle of the decision. What is needed is a stringent and sweeping and perfectly plain act which any one can construe for himself, that will make it impossible for the Hubbells or the Curtises or anybody to continue the work, and that Congress will be forced into passing such an act before long we have little doubt.

The broad grounds on which the opinion of the Court is rested show that such legislation need not by any means be confined, careful as the judges are to point out that it is so confined in the existing statute, to cases of "coöperation" in raising money between officials. Every reason which is mentioned for punishing such coöperation is a reason for making it a criminal offence for anybody, in private or public life, to levy political blackmail. The criminality of the practice consists in its introducing a sinister influence into the service, and perverting the views as to official duty prevailing in it. This influence is just as dangerous and strong, whether this or that form of machinery be resorted to to raise the tax. Whether the tax-gatherer is a member of Congress, or Treasury agent, or a mere volunteer, his enterprise, on the principles announced in this decision, is an offence against the United States, which Congress can make a crime and punish, just as it can an attempt to tamper with the mails or defraud the Custom-house.

Important as are the practical legal consequences of the decision, its moral effect is, perhaps, still more so. The most serious obstacle the enemies of any established abuse have to contend with is that it gets in time to be regarded as part of the natural order of things, so that those engaged in perpetuating it are really felt to be doing nothing more than the circumstances of the case make it customary to do. No one feels very badly about another man's doing what he thinks he would probably do in his place. The work of reforming abuses consists very largely in replacing the feeling that a practice is an indifferent one morally, by the feeling that it is reprehensible and must be stopped. Nothing is so well calculated to bring this about as a decision that the practice is an abuse, accompanied by a simple, straightforward statement of the reasons why it must be so regarded. How great a help such a decision is likely to give the cause of civil-service reform, a very slight consideration of the disastrous effect a contrary result would have had may suggest.

DIFFERENTIAL RATES.

THE report of the Railroad Advisory Commission on the subject of "differential rates" between the West and the seaboard is in substance that they have no recommendations to make. Under the present system, which they have been engaged in examining, the trunk lines make higher charges for the transportation of freight to New York and Boston than to Philadelphia and Baltimore. Taking the charges on Eastward-bound freight from Chicago to New York as the standard, the charges to Boston are the same, those to Philadelphia two cents, and

those to Baltimore three cents, per hundred pounds less. These differences are the result of a compromise between the roads, and the Commission was appointed to inquire and report upon the differences that should be made, and whether any changes were required. The Commission, consisting of Messrs. Thurman, Washburne, and Cooley, is as able and impartial a body as could have been selected for the work, and their report that no evidence has been offered to show that the existing rates are unjust, or that they operate to the prejudice of any of the Atlantic seaboard cities, will probably close the discussion of the subject for some time.

The Commissioners' report shows clearly that the complaints of unfairness in the existing system were not based on any examination or knowledge of the real nature of the system, but on an instinctive feeling that whatever the rates and differences were, they must be wrong. The Commissioners describe with a quiet humor "three distinct views" on the subject which were presented to them—the New York view, the Philadelphia view, and the Baltimore view—the New York view being that the differences in favor of Philadelphia and Baltimore are unjust; the Baltimore view being that differentials were right in principle, but too small; the Philadelphia view, that the differentials should continue, but that there ought to be no discrimination between Philadelphia and Baltimore. The supporters of each view had, of course, a theory of the business of transportation to back it up, one being that railroad rates ought to be proportioned to distance; another, that they ought to be determined by the cost of carriage; the third, that they should be regulated by competition — all beautiful illustrations of the ready uses to which a theory can be put when practical advantages are to be gained from it. The "distance principle" was supported by Philadelphia and Baltimore, since the practical effect of its adoption would be to increase greatly the differences in favor of those two cities. The Commissioners give a number of reasons why the distance principle will not work; the most obvious, perhaps, being that between roads serving the same city (*e. g.*, the Erie, Central, and Pennsylvania in relation to New York) it could not be applied at all, for such roads, "irrespective of distance, must conform to the lowest rates." New York, on the other hand, is in favor of the cost principle; the "New York view" being that if this were applied, differentials would disappear altogether. But here the trouble was that the advocates of this view did not bring forward any evidence in support of it. Instead of proving their case by official reports or figures, they called the Commissioners' attention "to the topographical features of the country between New York and the head of Lake Michigan," and "its admirable facilities for the construction of railroads, which would be economical in original outlay, and economical also in their operation." The Commissioners think that it is impossible to predict how the application of the cost principle would work in practice, but as no "reliable information" on the subject seemed to be attainable, their conclusion that there is no certainty of its application resulting in any benefit to New York seems safe and conservative.

The principle of competition, on the other hand, is the very principle that produces railroad wars, and all the troubles which lead to pooling arrangements and differential rates themselves. The Commissioners show very conclusively that competition for ocean freights must always tend to make differential rates a necessity. The competition between the trunk lines is chiefly in the products of the West —corn, wheat, etc.—which are exported to Europe. The price of these is fixed by the European demand, and they should net to the producer in the American market the foreign price less the charge for carrying and handling. The total charge for carrying to Europe by way of New York and Baltimore, for example, must be the same; and consequently, the ocean freight-rate from Baltimore being less than from New York, the inland rate must be greater. In this way competition itself tends to produce differential rates.

All this means, of course, that the railroads must in future, as in the past, fix the differentials themselves. The Commissioners do not pretend that the existing differentials may not become unjust. No previous compact has succeeded in controlling them permanently, and it is even possible that they may not now be right. But the Commissioners say that no evidence has been produced to show anything of the kind, and that therefore the matter must be left where it is, in the hands of the railroads. It must be said, however, that the very fact that there is no evidence shows a bad condition of administration. Each of the trunk lines and the community at large are interested in having evidence, and the Commissioners might have dwelt at greater length on this branch of the subject. They do indeed suggest that to enable the railroads "to judge fairly and with full understanding, accurate statistics of their business should be kept by each of them and submitted to the others or kept in some common office, and these statistics ought to be periodically given to the public also. Publicity is a great corrector of imaginary evils, and may be an important preventive of evils, both imaginary and real." They should be compelled to keep such statistics; and a report by a commission appointed to inquire into differential rates, that on most of the points involved no accurate evidence was attainable, should in future be impossible.

THE TRANSFORMATION OF THE FRENCH MAYOR.

In two articles recently printed in *L'Économiste Français*, M. Joseph Ferrand has given a very interesting account of the local governments of France, with especial reference to the powers of the mayors; and, as might have been expected, his inquiry clearly shows that in France, as in other countries, the problem of local government is still far from being solved in a satisfactory manner. But so far from there being the same difficulty that is very frequently met with in this country, of a mayor not clothed with power enough, M. Ferrand believes that the French mayor possesses too much of it, and that the true remedy lies in depriving him of some of it by enlarging that of other officers, and in altering the manner of selecting the mayor. The mayor possesses greater personal powers, if we may so call them, in France than in any other country which pretends to have a well-adjusted system of local government; and this arises in part from the fact that he is the agent of a government which interferes to a large extent with the private as well as the public life of the citizen, with his industrial as well as with his political relations.

Thus he is charged with the registration of births, marriages, and deaths; he manages the property of the commune; he supervises all public works, the schools, charitable institutions, savings-banks, public manufactures, etc.; he appoints all his agents and prepares the estimate of the revenue and expenditure of the commune. These are all duties of a local character. But, in addition, the mayor is an agent of the central authority of the state, and as such is charged with the execution of public acts regarding elections, the recruiting of the Army, and national taxes. He is thus the representative of the Government in the commune, and also the representative of the commune itself.

By the law of 28 Pluviose, year viii., the mayor was appointed by the central authority or by its immediate agents the prefects, the chief officers of the departments. And to render the commune more subject to the central government, the members of the municipal councils, bodies formed to assist the mayors, were also named by the sovereign or by the prefects. This manner of appointing the mayor and council was continued until 1831, when the councils were made elective. But instead of following up this plan and decreasing the powers of the mayor, who remained a state officer, and increasing the powers of the municipal government, by which all that pertained to local matters would be regulated by them but administered by the mayor—a plan that would have educated the people in the management of their local affairs, and thus prepared them for higher political duties—instead of doing this, the powers of the council were limited, and the financial dependence of the communes, by which in many instances they were compelled to ask aid of the state for their daily expenses, was continued. It is only too apparent that the shadow and not the substance of local government, by which is meant self-government, is here.

The Second Empire, being virtually a one-man power, necessarily involved some changes in the local governments, by which they were rendered more subservient to the central government. But there were no essential changes, and save in the manner of choosing the mayor, deputy-mayors, and municipal council, the powers of the local government have remained almost unchanged, although the central government has passed through many phases of change, from a monarchy to a republic. In 1867 the powers of the council were enlarged, and since that time there has been by means of special legislation a continual tinkering with the local governments, which has produced a lack of uniformity in their organization and functions.

Thus in 1876 upwards of 33,000 communes,

out of a total of 36,000, nominated their own mayors and deputy-mayors (*adjoints*); and this power was given to those communes in which there was no agent of the central authority (save the mayor) and was denied to those places in which a prefect, sub-prefect, or justice of the peace was to be found. In short, in every chief town of the department the mayor is appointed by the central authority, and in every other commune by the prefect. In the former case they are generally, but not always, taken from the municipal council, which is, as we have said, an elective body. And, as showing how amenable to the central authority the communal government is, not only the mayor, but also the deputy-mayors, and even the municipal council, may be suspended by the prefect for two months; and the mayor and deputies may be dismissed by the Secretary of State for the Home Department, and the municipal council may be suspended for one year by the same officer, and may be dissolved by a decree of the sovereign.

It is now proposed to make the mayor in all communes an elective officer, and this proposition is not regarded with any favor by M. Ferrand. The mayor, he says, in such a case, cannot exercise his twofold functions—that of representing the central authority and the commune—with anything like the energy he now possesses. Suppose, says M. Ferrand, the mayor is commanded by the sovereign to enforce in his commune an unpopular measure. Will he do this knowing that his position depends upon the good-will of the electors of the commune? Again, will a mayor forbear to use his personal powers and influences to defeat a candidate for the Conseil Général, or a Deputy, who may be opposed to him in politics? Will he, moreover, forbear to use his position and means to secure a reëlection? These possible results seem to M. Ferrand to be fatal to the proposition, and if they did occur would destroy to that extent the efficiency of communal administration. In Italy the Cabinet of Cairoli-Depretis proposed in 1880 to make the syndic, or chief officer of the commune, elective, but at the same time measures were taken to preserve intact the interests of the state in these local divisions of the territory. And M. Ferrand thinks that somewhat the same course must be adopted in France, since any such change in the manner of selecting a mayor as is proposed would of necessity involve some changes in his functions. An elective mayor would be more of a communal than a state officer, and would therefore be less intimately connected with the central authority than at present. In fact, very much the same results would follow as have occurred in this State when the sheriffs, clerks of counties, and coroners, and other properly State officers, were made elective. The tendency is in France, as it is here, to regard a popular election as the best method of selecting officials; but it might easily be shown that the application of such elections is of very limited scope, especially with regard to executive offices, where a higher responsibility is obtained by appointment. The result of the proposal combatted by M. Ferrand will be watched with interest, for, if accepted, it will give a new proof of the spread of republican ideas in France. But whether it will result in a better organized local administration, according to French notions, may be open to doubt.

THE ENGLISH POLICY IN EGYPT.

LONDON, July 11, 1882.

TO-DAY the English fleet is opening fire on the forts at Alexandria, an act whose consequences, now impossible to forecast, will have begun to make themselves felt before these lines reach you. As this is the point at which we have passed from discussion and diplomacy into the sphere of action, it is a good one for stopping to survey the steps by which we have been led up to an act likely to prove so momentous, and to describe the feelings and opinions with which the nation surveys the situation.

No question has arisen for a long time so full of complication as this; none in which there are so many factors to be considered—factors whose respective lines of conduct it is difficult to predict. In Egypt itself, although the army headed by Arabi Pasha is the dominant force, there are several other tendencies, and notably the religious sentiment of the people, to be dealt with. Then there is the Sultan, whose policy is so tortuous and vacillating that one cannot even explain it by supposing that he always intends the opposite of what he says. The four Powers, Germany, Austria, Russia, Italy, act to a certain extent together, yet with somewhat different objects in view; their collective action is the result sometimes of a determining impulse given by the most resolute, sometimes of a sort of compromise between the several volitions of each. France and England, as specially interested in Egypt, and as the Powers which have taken her ruler and her finances under their protection, form a group by themselves. Each professes, and to a certain extent feels, a wish to act in conjunction with the other. But their interests are not quite the same even in Egypt. Their respective positions in the general politics of Europe are of course quite different, as are the mental attitudes and constitutional habits both of their statesmen and of their peoples. I will attempt to sketch, so far as the materials yet published make it possible to do so, the line of policy which each seems to have sought to follow.

England has, or (to put it more exactly) is supposed to have, three interests in Egypt. The first is that of keeping the Suez Canal open and secure, affording a quiet and undisturbed passage for her troops, and still more for her mercantile vessels, from the Atlantic to the Indian and Pacific Oceans. The *quantum* of this interest is disputed, some holding that India and our Eastern trade would be in serious peril were the Canal stopped; others that this would merely entail a disagreeable but not formidable loss of time and money. However, it is admitted on all hands that the question of the Canal is a serious one for us. The second interest is that of our trade with Egypt, especially the export of cotton thence to England, and of our commercial colony established there. This consideration tells pretty strongly on people in Lancashire, some of whose towns depend for their cotton on the fine growths of the Delta; but if it stood alone, it would not be thought to justify intervention, because of course traders must take their chance, and can hardly expect military operations to be undertaken for their sake. The third is that of the English holders of Egyptian bonds. I mention it because it is frequently put forward by the non-interventionists as the origin of our present connection with Egypt, and a leading motive for keeping a hold on the country. But it has no real existence. There are, of course, persons in England who, having invested in Egyptian securities, would like to see a Western Power compel the payment of the interest due to them, and coerce or govern Egypt for that purpose. But such persons are few; they would not venture to avow publicly their desire; they could not, even secretly, really affect the policy of the country. Practically the bondholding interest may be left out of the matter.

Almost more serious than these English interests in the country are the positive engagements under which England has come. Under Lord Beaconsfield's Government she joined with France in establishing the Financial Control, and she acted in procuring the deposition of Ismail Pasha and the elevation of Tewfik to be Khedive in his place. She has thus virtually assumed a species of protectorate, and become bound in honor to keep on the throne the candidate placed there with her participation. Her consuls have constantly advised the Khedive, and did so in the beginning of the very crisis which has brought about the present conflict. As Tewfik followed this advice, England seems bound to see him through the consequences. Moreover, she presented in May last an ultimatum demanding the retirement of Arabi and his leading associates. Its rejection was followed soon after by the attack on Europeans in Alexandria, in which many English subjects were killed or injured, and the Consul himself beaten. Finally, even had England wished to leave Egypt to itself, she could not have told that this might not have ended in allowing France to become supreme there, a result which would have been displeasing to the English people, and might have exposed the Suez Canal to a new danger. All these considerations appeared to the English Government to oblige them to take an active part in the settlement of the Egyptian difficulty. They set before themselves three objects: the maintenance of the present Khedive, the suppression of Arabi and the other mutinous military leaders, the protection of the Canal against the risks to which anarchy in Egypt would expose it. They had three dangers to avoid: the entering on such a military intervention as would compel them to occupy and hold Egypt, the breaking of their quasi-partnership with France, the giving offence to the other four European Powers and thereby causing the disruption of the European concert. The best way of avoiding these evils seemed to be to invoke the authority of the Sultan as Suzerain of Egypt, and accordingly he was invited, with the reluctant concurrence of France, to restore order, if possible by sending an envoy; if not, then by armed force. When the envoy, Dervish Pasha, failed to effect anything, and the Sultan, declaring that the crisis had terminated, but really fearing to appear the ally of infidels against good Mussulmans, refused to intervene with arms, a Conference was proposed as the best means of overcoming his unwillingness, and at the same time of associating the other Powers of Europe in the conduct and solution of the difficulty. This Conference, as you know, has sat for ten days or so, but as yet with no visible result. Throughout, the effort of the English Government has been to avoid isolated action, and obvious as were the objections to calling in the Turks, whom Mr. Gladstone and his followers have so often denounced, even these objections have been thought less than those applying to an occupation of Egypt by English and French troops. Even when the English fleet was despatched to Alexandria, its purpose was stated to be the protection of the lives and property of British subjects; and although this cannot be so well urged now, when all British subjects have left the country, the

bombardment just opened is announced to be not so much a coercive measure directed against the rebel soldiery as a defensive measure, rendered necessary by the continued erection of fortifications threatening the fleet. Nothing has been stated as to the landing of troops: the final solution of the problem is still being sought at Constantinople through action on the Sultan.

In both these last developments, the action at Alexandria and the negotiations at Constantinople, the often threatened divergence of ideas between England and France has at last declared itself. Of the policy of France I can give you only an English view, which may be as far from appreciating its real character as the French newspapers are from comprehending the grounds of the policy of England. France seems to us to have been governed by three motives. The first is the desire to keep abreast in every way of England, and allow England to gain no advantage which she does not share. (I need hardly add that she credits England with a far stronger disposition towards aggression than we conceive ourselves to be moved by.) The second is a prudent disposition to respect Mohammedan susceptibilities, to awaken no fresh burst of fanaticism, which might spread to Tunis and Algeria and renew the difficulties she has had to encounter there. And the third is an anxiety to avoid all sources of European dissension, especially such as might bring her into a collision with Germany, for which she is not at the moment prepared. Since the month of February (for under the brief rule of M. Gambetta a different and more ambitious line of conduct was pursued) the attitude of France has been very cautious and pacific. She has either criticised or demurred to most of the propositions England has advanced for joint action, has striven to avoid approaches to active intervention, and has been even more reluctant to appeal to the Sultan for aid in untying the knot. Her objection to his interference is doubtless due to the great hostility which the Turks have shown to France ever since the Tunisian expedition, which wounded their religious feelings as well as their claim, however empty, of supremacy over the states of North Africa. The Sultan did his utmost in an underhand way to stir up resistance to the French in Tunis; and any recovery by him of his authority in Egypt would doubtless be felt all along the south coast of the Mediterranean, and add fuel to the flame of Mohammedan irritation. France, therefore, under M. de Freycinet as well as under M. Gambetta, has been with difficulty induced to join in any appeal to the Sultan. Nothing but the apprehension that an English occupation of Egypt might be the alternative seems to have led her to acquiesce. And at the Conference which has invited the Sultan to interpose to restore order, the condition annexed by the French envoy is reported to have been that the Turks should enter the country purely as the mandatories of the six Powers, and not in virtue of the Sultan's paramount authority—a condition to which the latter is not likely to assent.

How far public opinion in France approves the conduct of its Government it is not easy to learn; but apparently no other course is strongly pressed by any section except that which follows M. Gambetta. Then in England the tendencies are much the same as those I endeavored to describe to you three weeks or a month ago. The mass of the nation doesn't understand the question, and knows that it doesn't. It is therefore disposed to believe that Mr. Gladstone, who has never before been accused of an ambitious, aggressive, warlike policy, but rather of being too humble and undecided, must have yielded to nothing less than necessity when he ordered so strong a step as the bombardment of the forts at Alexandria. The idea that the Canal is endangered comes in to reinforce this confidence. Among the Tory leaders, no accusation, except that of not having acted with sufficient energy in the earlier stages of the crisis, has yet been formulated; but when the time for debate comes, weak points will, of course, be discovered. There is, to be sure, a section of the Liberal party which declares we have no business in Egypt at all, and protests against the acts of to-day. But this party is not strong in the country, and in Parliament could probably muster no more than a dozen votes. On the whole, it seems as if the Government was carrying the general feeling of the people along with it; and if the operations of to-day turn out well, the Government may even gain credit for its vigorous action. Y.

THE COMING ELECTIONS FOR THE PRUSSIAN LANDTAG.

BERLIN, July 1, 1882.

SINCE the defeat of the tobacco monopoly, chaos rules in our political circles. Nobody can answer the question, What is to come next? Such an overwhelming overthrow of Bismarck's pet measure was not anticipated even by the most sanguine: it is his Moscow. Think of a House with a Conservative majority, and on the day of the vote numbering 332 members present, of whom only 43 voted with the Government, and you can easily imagine that the result created a deep sensation even among Bismarck's minions. It is true, he has experienced some heavier defeats: not a single man rose for the attempted restriction of freedom of speech in the Reichstag; only two votes were given for the military law which was designed to exempt the richer classes from serving in the Army in certain cases; and the plan of voting the budget once in every two years instead of annually found no support at all. These bills, however, were mere trial-balloons: they came and disappeared the same day; but the tobacco monopoly was prepared for four years with all the Chancellor's energy and obstinacy. Great folios were filled with the examination of witnesses, mountains of opinions were amassed, commissions of experts were called, an exploded French institution (the "Conseil Supérieur") was instituted, and a "Volkswirthschaftsrath" introduced into Prussia to further the monopoly, and two Ministers of Finance were sacrificed to the great idol—Camphausen at the beginning and Bitter at the end. God have mercy on their souls, they will never be resuscitated!

The wounds, however, which have been inflicted on our industry and commerce, as well as on the national prosperity, will not so easily be healed. Four years of strife, full of anxiety and fear, of hope and low spirits, have been in vain. How much unlucky speculation was stirred up, how much healthy activity was intimidated! Three, if not four, times our poor manufacturers and tobacco merchants had to change the basis of their operations. Some purchased large quantities of tobacco in advance; others confined themselves to the lowest limit of supply; one extended his business, as he expected to realize profits from the monopoly, while another, for the opposite reason, did not dare to lay in a large stock of the splendid crop of 1881. Instead of devoting themselves to their legitimate calling, and pushing their regular business, thousands of merchants for the last four years could think of nothing else than how to evade the threatening disaster. The lobby of the Reichstag was beset by parties interested in the tobacco trade. There was no end of letter-writing, meetings, travelling, inquiring, and counselling. Shall we or shall we not accept the monopoly? Shall we side with Bismarck in order to get heavy damages, or shall we offer resistance? Shall we beseech or defy the Government? Every shop, every office, became a conventicle of debating politicians. The Chamber of Commerce of a large city wanted the advice of a prominent Deputy. "What can I tell you?" he answered. "You had better inquire at Rome." But this time the Pope and his satellites held back, and the Centre voted with the Opposition against the monopoly, as Bismarck had not been found pliant and yielding enough in relation to the Falk laws. If a statistical table could be made of all the extravagance and waste of capital, energy, and strength which this unfortunate monopoly has wrought throughout Germany, one would be amazed at the enormous sums unprofitably thrown away. But worse than that, the true economic perception, that only the quiet and undisturbed day's and night's industry and steadiness of devoted and cheerful labor make house and grange flourish, has nearly been extinguished by Bismarck's home policy. Instead of meditating how to improve their factories and shops, or how to perfect their method of buying and selling all the year round, some puzzle their brains how to avail themselves of the favor of the law, and others again how they may best avert its disadvantages. Politics has been withdrawn from poltics, and has penetrated places where it does not belong. And still "Catheder-Socialists" like A. Schäffle and A. Wagner, who some years ago seriously proposed that the large cities should buy all the dwelling and tenement-houses within their limits, in order to accommodate the poor workingmen, are still the Chancellor's trusted advisers, and his teachers in political economy.

How can this sad state of affairs be changed? There is only one alternative. In other really constitutional countries a ministry having suffered such an ignominious defeat would resign, and make room for a successor who agreed with the large majority of the people. Bismarck, of course, is far from indulging in such "sentimental whims." He holds the power and will hold it to the end. The other day he likened himself to Robert Bruce and the spider. In fact, he will not yield, nor will he dissolve the present Reichstag and appeal to the people, because he very well knows that his schemes are detested by the people. He must, therefore, be again defeated, and to that end a Liberal majority be elected for the German Reichstag as well as for the Prussian Landtag. This chance is not only possible, but the more likely as the Chancellor is again on the road to the worst kind of demagogism. In the last year's elections he claimed the proceeds of the tobacco monopoly as the "patrimony of the disinherited," and at the last debate in the Reichstag he gave the shibboleth for the next Landtag's election in the words, "Away with the sheriff" (executor), which was, is, and will be repeated over and over again by the governmental press. This bugbear of the sheriff is to frighten the people into granting new indirect, and to discredit the payment and levy of old direct, taxes. The sheriff, of course, in no country in the world is a popular man, but his office cannot be abolished as long as there are people unwilling or unable to contribute their share toward the expenses of the Government. On the other hand, the large mass of the people are not so stupid or incapable of judgment as the Chancellor supposes; besides, the poorer classes, with a yearly income of less than 480 marks, pay nothing, and thus do not make the personal acquaintance of the sheriff. Per contra, the poorer and middle classes, if they did not know it before, now very well appreciate the fact that indirect taxes laid on the necessaries of life are much more oppressive and fall heavier on them than on the well-to-do.

I will not dwell here on the exaggerated state-

ments of the Chancellor and his organs about the number of seizures and forced sales. For the sake of impressing the popular mind, the amount of several years is summed up, in order to make it appear higher; and the different stages, from the notice and warning down to a real seizure, are taken as so many separate acts, while in fact they constitute only one. The papers are full of instances and proofs opposed to the above partial statements, and thus reduce the latter to their real insignificance. I therefore believe that this manœuvre will not succeed. I very well understand how a Socialist who wishes to make capital for his ideas will act practically by abusing the sheriff or exposing him to public attacks, but I do not understand how a minister in such an authoritative and conspicuous position as the powerful Chancellor can muster the courage officially to denounce the daily-increasing misery of executions, "loudly crying to heaven," and thus to sap the foundations of that same frame of government which he above all others is bound to strengthen and protect. What inference will the uneducated draw from such passionate appeals to ignorance and prejudice? Of course, that it will be best to pay no taxes at all, and if possible to chase away the sheriff. In my opinion, it is sawing off the branch of the tree on which the Government sits to stir up the dislike of the taxpayers to the levy of taxes.

And yet the reform of the taxes is Bismarck's chief object. How he will effect it he has not yet made public. The country wants a well-digested plan, but he only answers with big promises and general phrases, saying that the Government must prove to the working classes by facts that they, too, are entitled to its protection. But which of his favorite measures will immediately be carried out we do not learn, and I believe the Chancellor does not yet know himself. This much, however, is certain, that he wants more money than has hitherto been anticipated, and that at least some 200 or 300 millions of marks per year will for the present be required. Now, no Liberal will vote for any new taxes until those on the necessaries of life have first been abolished; moreover, he wants to know beforehand how the new taxes will be spent. We are in no hurry for a reform, and can wait; all the necessary governmental expenses have been provided for, and of new socialistic experiments there is no need. The other day I found an article in one of the official papers which is too significant not to be mentioned. Mr. Bitter, to whom I have alluded above, had to resign his secretaryship of the Prussian treasury because he did not effectually assist the Chancellor in his tobacco campaign. This gentleman is of a very subordinate stamp, and it is a settled fact that his successor will not excel him. "Our last three ministers of finance," the paper said, "have in managing the finances committed the great mistake of not keeping the higher interests of the Government in view, or, in other words, of considering their office as an end in itself. Instead of subordinating it to the high political and social tasks of the state, they have placed themselves in brusque contradiction to these, and withheld the means necessary to remove existing evils and to solve new problems required by the wants of society." These words, if they have any sense at all, evidently mean that a sound financial policy is not to be based on financial principles, but must serve the interests and views of the almighty Chancellor; they are evidently published with a single eye to the impending elections. In keeping with this opinion, the public is informed that Prince Bismarck will temporarily charge himself with the management of the finances, so that although not residing in Berlin, besides being Chancellor of the Empire, he will be Prussian Minister of Foreign Affairs, as well as of Commerce and of the Treasury. A subservient tool doing the daily routine business will finally be found.

This time it evidently is Mr. Scholz, a young aspiring officer (*Streber*), who has hitherto been Assistant Secretary of State in the Imperial Treasury. It is a pity that the higher dignitaries of state have so far deteriorated that instead of feeling themselves Bismarck's coördinates, they act on command, and strictly follow the many changes which their self-constituted chief is in the habit of undergoing. When he justifies a new and sudden change of opinion by declaring that his foreign policy had prevented him from studying a question raised by himself, sober and earnest men will answer him, and have already done so, that he ought to have left the management of home affairs to other less occupied and more experienced hands. The creatures, however, who have been reared and elevated by him find their chief's excuses quite natural, if not grand, and they adore to-day what they yesterday burned, and burn to-day what they adored yesterday. After having been used for a while they are mercilessly thrown aside like squeezed oranges, and replaced by others who are, if possible, still less stable. When he suffers a well-merited defeat, Bismarck bitterly complains of the small animosities of the political factions, which subordinate patriotism to petty party interests. "No faction," he says, "is strong enough to support the Government," a sentence which translated into the affirmative means that the Government would most cheerfully avail itself of the services of a party if it were strong enough and submitted to Bismarck's discretion. "If the Administration," he continues, "should accept the support of a party, it would become dependent on the politicians, and be bound to make concessions to or reward the leaders, in order to keep them on its side." This reasoning is wrong—at least not justified in our political history; for as long as Bismarck (from 1867 to 1876) had a liberal policy, the Liberals followed him without making any conditions at all, and identified their course of action with his. Thus it happened that the Ministers were taken from the Conservative side, while, with the assistance of the Liberals, old reactionary laws were repealed and new progressive ones passed. Never has a statesman been in such a favorable condition. But those times have passed. The Liberals of all shades are now unanimously of opinion that Bismarck's influence must be broken, and I believe that if it be not broken, it will at least be paralyzed, and that legislation will come to a standstill. The next election to the Prussian Landtag will prove the correctness of my view: the Conservatives, divided among themselves, and jealous of each other, will be badly beaten.

PONTMARTIN'S MEMOIRS.

PARIS, June 22.

IT is always interesting to read conscientious recollections even of an ordinary man. Reality is all we ought to care about; any real life, humble as it may have been, has its lessons, its touching or dramatic episodes. M. Armand de Pontmartin is not much known out of France; he has even in France but a limited reputation. He has always been on the outskirts of literature: he has written feuilletons, dramatic or other, and a few novels, which have not made him popular. But he has lived in interesting times, and has known interesting men. He gives us now his 'Mémoires' at the same moment that M. Maxime Du Camp does. He remarks modestly that in old times the writers of Mémoires were generals, statesmen, leaders of men; but that in the eighteenth century it became the fashion for the literary men—for Marmontel, for Rousseau, and others—to show themselves like actors before the public. After all, these philosophers, these academicians in the midst of the breaking up of an age of long-established institutions, represented a new force, still invisible, but already very powerful. They were becoming more important than negotiators, than diplomats, than ministers, than generals, as they were to furnish new ideas to a new civilization. M. de Pontmartin has no such high pretensions; he has been a spectator lost in a crowd, and merely wishes to say what he has seen.

He was born in the south, in a village which lies between Nîmes and Avignon; he remembers the journey of Madame Duchess of Angoulême in the south of France, and the mission of the "Fathers of the Faith" to Avignon. The Mayor, a peasant, begged him to make an address to Madame. The young man was eighteen years old; Chateaubriand was his idol; his family was loyal. He prepared a short address; but, alas! Madame did not stop. Her carriages passed like a vision, and when the peasants were ready to scream "Vive Madame!" all was gone. It was, he says, his first lesson in political philosophy. The mission of Avignon in 1819 has remained legendary in the south. From all parts of the south the peasants came to hear the sermons of the Fathers: Royalists and Bonapartists were equally fervent. It was what is called in America a revival. Old usurers returned money which they had received for years.

Pontmartin made brilliant studies in Paris; he won the first prize at the *concours général*, and dined, on this occasion, at the table of the Minister of Public Instruction, M. de Vatisménil, with Alfred de Musset, who had taken the second prize in philosophy. What a philosopher! The young poet, then seventeen years old, wrote a ponderous essay in Latin: "Quibus libet vitæ in temporibus, quibuscumque incumbat disciplinis homo," etc. There were six pages like that. We naturally must choose in the memoirs of Pontmartin what concerns the bigger stars of the Romantic sky:

> "One forms generally," he observes, "a wrong idea of the literary situation of M. Victor Hugo during the last two years of the Restoration. At a distance it is natural to see everything in masses, and now, at this distance of more than a half-century, one can easily believe that the poet of the 'Orientales,' who was soon to be the author of 'Hernani,' had on his side all the studios, all the partisans of progress, all the students, all the lettered and liberal youth, and had against him all the old, the traditional men, the remnants of the literature of the Empire, those who were called the Classics, the *perruques*, the *momies*. It was not so. The public of M. Victor Hugo was already very enthusiastic, but was very restricted. It was a staff; it was not an army. Out of ten of my comrades, there were at least eight who persisted in preferring to him Casimir Delavigne; and, as for placing him on the same line with Lamartine, such an idea did not occur to anybody."

Pontmartin was one of the "staff" of Victor Hugo. He was angry when one of his fellow-students, meeting him in the garden of the Luxembourg or under the galleries of the Odéon, affected to cite some verse of the 'Orientales' with an ironical sneer—

> "Tantôt d'une eau dormante il lève son corps *bleu*";

or,

> "Un homme alors passait, couvert d'un caftan *vert*";

or,

> "Elle aimait trop le bal, c'est ce qui l'a tuée."

We have forgotten now the sensation produced by this sort of versification; the poet has completely thrown it into the shade. Pontmartin was already on the side of the poet; he was a strong royalist, and Hugo also was then a royalist. The monarchical papers defended him; he

was constantly attacked and ridiculed by the Liberals of the *Journal des Débats*, of the *Constitutionnel*, and of the *National*. The Romantics were enthusiastic for the Middle Ages, for Christian art, for Gothic cathedrals; they professed to despise Greek temples, the neo-paganism of the eighteenth century, and the philosophical movement. The Classics laughed heartily when Hugo wrote such verses as these in his "Pluie d'Été":

"Le petit ruisseau de la plaine,
Pour une heure enflé, roule et traîne
Brins d'herbe, lézards endormis;
Court, et précipitant son onde
Du haut d'un caillou qu'il inonde,
Fait des Niagaras aux fourmis!"

Even Pontmartin seems to have found it difficult to defend these small Niagaras.

The literary discussions often took place in the reading-rooms (*cabinets de lecture*) of Madame Cardinal. I knew the last of these reading-rooms, which disappeared one by one. They were a feature of old Paris. There was always a lady who gave out the books and papers, and was on familiar and friendly terms with her clients—young men who could not afford to buy the books they wished to read, old pensioned officers and employees. The Célimène of the circulating library was amiable to all; she had political as well as literary opinions; from her throne she passed judgment on men and things. Her name was often Malvina. Her life was a mystery; what became of her when the last lamp with the green shade was extinguished nobody knew. The Malvina of the time of 1829 and 1830 knew Victor Hugo, and Sainte-Beuve, and Alfred de Musset, Charles Nodier, Émile and Antony Deschamps, Devéria the painter, Bocage, Ligier, Beauvallet, Lockroy, actors of the Odéon; Laboulaye (then completely unknown); Nisard, Camille Doucet, now members of the French Academy.

On the 25th of February, 1830, Paul Huet, who made a reputation as a landscape painter, came to Pontmartin and asked him, "'Will you go to the first representation of "Hernani"?' 'Will I go?' said I; 'ask the youth thirsting for love if he wishes *Juliet* to throw him the silken ladder; ask the hungry poet if he wishes Chevet to offer him *gratis* a dinner in three courses; ask the *figurant* of the Ambigu if he wishes to make his début at the French Theatre.' 'Well, I will have a ticket for you; but I tell you that it will be hard.' 'Hard verses? Then it will not be Hugo?' 'Yes, Hugo, and of the best.'" It was necessary to enter the theatre at two o'clock in the afternoon, and to wait for the representation without a dinner. Youth is a good thing, and enthusiasm well fills the place of a dinner. The tickets were distributed at Victor Hugo's house. He signed on each the name "Hierro," which also appears on the original edition of "Hernani." Pontmartin tells us that there were about four hundred young men who received such tickets; among them were the painter Louis Boulanger, Émile Deschamps the poet, Charles Nodier, Devéria, Montalivet. The next day, a long queue was formed early before the theatre. Théophile Gautier was conspicuous in it by his long, flowing hair and his red waistcoat. For six hours the Romantics waited at a little door opening on the Rue Montpensier. Pontmartin tells us that the enthusiasm of all these young men had an interested object: they all wished to influence Hugo by their devotion, and to take him over to the Liberal cause.

He gives a very graphic account of the famous representation of "Hernani." In the pit were all the Romantics; in the boxes were the Classics: it seemed to be the battle of two worlds, of two different ideals. Pontmartin says very candidly that the first representation of "Hernani" created more stupor than admiration, even among the Romantics. Some of the latter were completely upset by certain faults of taste, ponderous pleasantries, puns like

"Le jeune amant sans barbe à la barbe du vieux."

A young Romantic was heard to exclaim: "Ma foi, j'aime mieux Racine!" The fifth act, fortunately, the finest dramatic work of Hugo, carried the public away. Mlle. Mars, though she was a Classic, somewhat hostile to the new poet, was conscientious, and she surpassed herself in the famous scene of the death of *Doña Sol*. The next day, the press attacked Hugo with the greatest severity. Every representation became a battle. Mlle. Mars became tired of these terrible scenes, and finally "Hernani" disappeared from the stage, and was not played again till a long time afterward.

Alexandre Dumas (the father) was only twenty-seven years old at this time. Pontmartin was invited to hear him read a drama, with Decamps, Tony Johannot, Paul Huet, Alfred de Vigny, and a few others. This singular man, with his mulatto complexion, his sensual face, prided himself in his old age on having written 1,200 volumes, which could all be read by a workingman of the Faubourg St. Antoine and by the girls of the Faubourg St. Germain. He was a great child, a marvellous story-teller. Dumas began life as a clerk in the bureaux of the Palais Royal. He owed much to Louis Philippe, and he was afterward patronized by his sons. In his memoirs he speaks as if he all alone had made the Revolution of 1830. To be sure, he afterward made the Revolution of 1848. He made the conquest of Sicily with Garibaldi—or thought that he did; at any rate, he took possession of one of the royal palaces of the King of the Two Sicilies, and the Italians found it difficult to turn him out.

Pontmartin gives interesting details of Ozanam, the Christian philosopher, whom he chose, in a great crisis, as his religious and intellectual director. Ozanam is nearly forgotten; he has had his day. He was a philanthropist, hoping to reconcile the poor and the rich, to bring all men together in a Christian spirit. He had the heart of a priest, the eloquence of an apostle. He was fully aware of the terrible dangers of the social question. Pontmartin becomes very eloquent when he speaks of the influence of Chateaubriand on the youth of the Restoration. He maintains that Chateaubriand did more than anybody else to mould the minds of the generations who came forward at the end of the French Empire and before Louis Philippe—more than Lamartine, more than Musset did after him. He reconciled religion and royalism with liberalism; he opened new horizons in every field of thought; he was the personification of all that was noble in old France, of all that was coming to light in the new France.

M. de Pontmartin has only given in this first volume the recollections of his childhood and of his youth. His style is lively, his sincerity is evident. We hope that he will continue the publication of these memoirs. There is much space still before him—the whole reign of Louis Philippe, the Revolution of 1848, the Second Empire, and the Republic of to-day.

GARIBALDI AND MAZZINI.

GENOA, June 29, 1882.

GARIBALDI is left literally alone in his glory, there in the weird, wild, desolate Caprera, which he loved with an intensity inexplicable to all save those who had caught the half-poetic, half-savage side of his singular character. I remember when, in 1855, with some other English friends, we accompanied him on a shooting tour over the island of Sardinia, what wistful eyes he cast from the shores of the Maddalena to what appeared a mere barren rock in the ocean; how he detested the ovations of the Sardinians, in whom, however, he instilled his then newly-born faith in the King of Sardinia as the future champion of Italy. During the month we spent at Sassari, Macomer, and Cagliari, he lived literally gun in hand, flaying his meat on the fires kindled of myrtle and cistus, rising at dawn, going "to roost with the chickens," as his hosts remarked; polite to all, but interested in nothing save the slaughter of wild boars, foxes, hares, partridges—whatever came to gun. He and his faithful Basso were the best sportsmen known, never missing a bird in the air or a fish rising from the sea. "If ever I can put together 1,000 francs," he said, as we returned, "Caprera shall be mine, and I shall invite you, who have not many wants, to come and rough it with me." Next year we received a letter announcing the death of his brother Felix, who had left him 25,000 francs.

On the Island of Caprera at that time the Englishman Collins possessed a small portion; the remainder was state property, and Garibaldi bought it in, lot by lot, coming over to England to purchase a cutter for the transport of building material from Genoa to the desolate island. Menotti, Basso, and a couple of humble comrades, living with him under a tent, first built the rough log house, then the modest white house, where, even as late as 1867, when I went over to arrange his flight after the Government had imprisoned him in Alessandria and blockaded the island, the same preadamitic simplicity prevailed. Later some English friends presented him with the yet unpurchased portions of the island, and, under the régime of his second peasant wife, comforts and even luxury were gradually introduced. But Garibaldi never changed his habits or his predilections, and so intense was his desire that his ashes should remain at Caprera, that he had ordered his wife to burn his remains before announcing his death even to the other members of the family. This, and this only, is true, as I wrote in my last letter; nor until I could see the various members of the family would I give heed to any of the different versions of the reasons for disobedience. Last week Dr. Prandina, and yesterday the family, left Caprera, and from their various testimony results the fact that Garibaldi's last behest has not been wilfully disobeyed, and that "Quod differtur non aufertur." Garibaldi willed to be burnt in true pagan-Indian Shelley fashion, not cremated in modern "civilized" style. Dr. Prandina, to whom he entrusted the execution of this his express desire, is one of the most enthusiastic champions of cremation, and is a member of the Milanese society which, for the payment of a certain sum during life, engages to cremate any one who shall so ordain in his will. In the grand monumental cemetery at Milan there are two crematories, one erected by Keller, on the Gorini system, and presented to the municipality of Milan on the express condition that his body should be the first cremated, and the "Poma" crematory, a much more complicated affair. In the former, where, on the average, two corpses are cremated per week, the body is immersed in a solution heated to a high temperature, the chemical composition of which is known only to a few, passed into the furnace, where it remains two hours, and where, by the arrangement of a quantity of earthenware balls to which the soot clings, all offensive odor is destroyed. At the expiration of the second hour the body is removed to a sort of annealing-room, where the bones in another hour crumble to the finest dust, and, placed in an urn, can be removed by the friends of the deceased or deposited in a sort of *cenerario* built for the purpose. As only wood is used in the burning, the

process is inexpensive: the payment of 32 francs insures the right of cremation in the Keller crematory, Gorini system, at Milan. Well, all this Dr. Prandina explained to Garibaldi when the latter first broached his intentions. Garibaldi listened attentively, says Dr. Prandina, one of our old volunteer surgeons, whose word can be implicitly relied on, and then said: "No! I won't be baked in an oven like a fowl. When I am dead, do you lay me on that little iron bed, and the bed on the pyre *which I shall have prepared;* dress me in my red shirt, leave my face uncovered, and turn my face to the east." Prandina objected that the tremendous wind-blasts of Caprera would disperse the ashes in great part. "No matter: you can secure a handful to put in an urn between the tombs of Rosa and Anita." "But," still urged Prandina, "they will not even be all *your* ashes, but be mixed with the wood of the pyre." "*Tanto meglio*," quoth the General; "the pyre will be made of the trees and bushes that I love—I planted them all myself."

In January, 1882, when Garibaldi was at Naples, Prandina, who had ever felt most uncomfortable at the idea of the responsibility, went again to him and said: "General, should we be so unfortunate as to lose you on the Continent, am I then to cremate you at Milan?" "Certainly *not;* you will hire a hack and take me back to Caprera, and there do with my remains exactly as I told you!" Just a month after the General's return home he died. I mistook the date of the departure of his own doctors, which took place at the commencement, and not at the end of May. He had taken next to no food for twelve days, but the only doctor there, an inexperienced youth, said there was no danger. But Garibaldi knew that he was dying, and on the very eve of his death insisted on having a bath. His last visit had been to the crematory, where he had seen the wood stacked on the old millstones. But when actually dead, and the widow, with only Menotti, just arrived, was there, it was natural they should await the rest of the family, who, summoned, arrived too late. And meanwhile the fatal news had spread also—the instructions for the burning of the body, which Prandina, on starting for Caprera, had left with the Prefect of Genoa to be transmitted to the Government.

Within the first three days 12,000 telegrams reached the family, the majority imploring Menotti to have the body embalmed; and meanwhile it was clearly proved that the wood stacked, and all the aromatic and resinous wood existing in Caprera, would not suffice, in twenty-four hours in the open air, to consume the precious relics. Then, very naturally, a sudden horror seized on all. Even those who had gone, full of poetic reverence for the idea, including Alberto Mario, who nurtured the hope that the heart, like Shelley's, might be preserved for Rome, protested that they would leave the island immediately rather than see the corpse desecrated. The Prefect of Sassari declared formally that open-air burning was illegal. The Government sent doctors and surgeons, with materials for building a crematory, and Dr. Pini of Milan accompanied them. But he does not possess the secret of the chemical solution. Moreover, the General's objection to being baked like a fowl was brought forward. Hence the body was embalmed, placed in three coffins of zinc, chestnut, and walnut, and the official ceremony (present, Prince Thomas of Genoa, representative of King Humbert and brother to Queen Margaret) over, it was decided to bury the coffin between the two children, Rosa and Anita. A granite rock protruding, this was found impossible, so a grave was built hastily of brick, and the body deposited there. When the representatives of King, Senate, Chambers, municipalities, and every association in Italy, besides thousands of individuals who thronged there on their own account—all weather-bound for twenty-four hours—had finally quitted Caprera, the family, fearing the damp, had the body removed, and the sepulchre lined with hydraulic cement. Then the body was replaced, and five successive granite slabs brought to cover the tomb. All broke on being placed thereon. Finally, all the male members of the family, aided by some robust fishermen from the Maddalena and the sailors of the *Cariddi* (Government frigate), rolled down a massive block of granite weighing four tons, on which the single word "Garibaldi" was roughly hewn.

So the sepulchre is sealed and guarded by twenty-five soldiers of the line, and, more jealously still, by the inhabitants of the Maddalena, who, with the half-savage population of Sardinia, are resolved that the General shall be obeyed at least in this, that the remains shall not be removed from Caprera. The family, meanwhile, saddened and bewildered by conflicting duties, have left the final decision to the National Assembly; and, despite the first strong current in favor of obedience, in letter and in spirit, to Garibaldi's last behest, it is more than probable that they will decree that he be burnt at Caprera, and the ashes transported to the Janiculum. Political reasons for this decision may bias many: the idea of Garibaldi, from the heights of the Janiculum, whence, in 1849, he defied and defeated the foreign champions of the Pope, still from his urn menacing the Vatican and the Quirinal, is naturally an attractive one to the ever-increasing Republican party. But there are two material reasons which have weight with all who loved and revered the General without regard to party or to creed. In the first place, a very justifiable fear of body-snatchers prevails. At present the body is, and the ashes would be, strictly guarded; but time dims enthusiasm and dulls vigilance, and a band of adventurous scoundrels might at least attempt a seizure. Secondly, after the letter to Prandina, Garibaldi, yielding to the entreaties of his peasant wife (wife not yet at that time), provided that her ashes should be mingled with his own. Naturally, the first family, whose mother, the brave, unfortunate Anita, lies alone in the cemetery of Nice, on foreign soil, would object to this; nor would the nation in general care to make a pilgrimage to the shrine of La Francesca. So, for one reason and another, and all piled together, much time will not elapse before we shall see a monument covering the remains or ashes of Garibaldi on the tallest heights within the walls of Rome.

Assuredly, never in any time or country has the death of one man excited such universal, spontaneous, passionate grief. Truly, he had "the genius to be worshipped" in his life, and now all strive in their own fashion to prolong that worship to the inanimate clay. Another, who had only the genius to be loved, and who till now has never had the justice to be honored in his grave, divided with Garibaldi the public feeling and attention of this sad month of June. But for the catastrophe of the 2d, the inauguration of the monument to Mazzini in his native Genoa on the 22d of June, the anniversary of his birthday, would have brought together all the rank and file of the Italian democracy. As it was, the ceremony was most impressive—pathetic, even solemn. All signs of festivity or of rejoicing were suppressed—no illuminations, no fireworks, no banquets, no pleasure-trips; but 500 banners, representing the thought and action of Italy, veiled in black, surrounded the base, and thousands of Italians gazed, many with tearful eyes, on the marble image of the great Genoese, whom Swinburne so aptly coupled with Columbus in his "Song of Italy":

> "One found a new world 'mid the virgin sea,
> And one found Italy."

I send you the original poem written by Swinburne for the occasion.

The monument unveiled, all the workingmen's associations met for serious discussion of their interests and political programme; then, on the morrow, all marched up to the cemetery of Staglieno, which rises on the lowest spur of the Apennines, and where Mazzini (alas! embalmed) looks out on his mother's tomb beneath the cypresses. Each veiled flag bent in salutation; then the huge procession dispersed, and the silence remained unbroken. The city is still tapestried with texts from his works, and one may truly say: "He being dead yet speaketh."

Correspondence.

HEREDITY OF JOSEPH STICKNEY.

To the Editor of The Nation:

Sir: In your issue of July 13 you confound Charles W. Stickney, the Harvard graduate, who committed a homicide in Colorado, and who was acquitted on the ground of insanity, with Joseph Stickney, ex-vice-president of a New York coal company, ex-superintendent of a Wilkesbarre., Pa., coal-mine, and wholesale dealer in coal at No. 7 Cortlandt Street, New York City, of whose 254 immediate ascendants I found 174, and wrote short biographies in the July number of the *Granite Monthly* of Concord, where he is one of the largest real-estate owners.

As none of Joseph's ascendants are known to have been insane, or to have died of consumption, or to have been divorced, and only two to have drunk to excess, you say that, "on the Guiteau theory of defence, his case [meaning that of Charles W.] is one which clearly calls for hanging." It is also true of Joseph's ascendants that there were only six marriages of cousins—one each of first, second, third, and tenth cousins, and two of fifth cousins. Among the thirty-two couples that constitute the sixth generation were representatives from over eighteen different counties in England, besides those from Scotland and Ireland, showing few marriages of identity or proximity of birthplaces. In New England there were many such marriages, as they lived in four counties—Essex, Mass., and Rockingham, Hillsboro, and Merrimack, N. H.

Undoubtedly the ascendants of Joseph Stickney differed greatly in these respects from those of Charles W. Stickney and Charles J. Guiteau. Among the ascendants of Charles W. were families by the names of Kehew, Dow, Jackman, Pidgeon, Burrill, Poor, and Morse—respectable names, probably, but such as do not prejudice us so much in favor of their owners as those of Gilman, Starbuck, Shapleigh, Coffin, Ward, Dudley, Woodbridge, Parker, Goldstone, Bright, Audley, Peabody, Dane, Osgood, Jewett, Denton, Carleton, Peaslee, and Andrew—the names of Joseph's ancestors.

Dr. George M. Beard, a student of heredity, who patriotically and heroically tried to save the country from the disgrace of hanging an insane man, will yet show, I trust, that the ascendants of the insane and criminals differ so radically from those of morally, mentally, and physically healthy men that black and white men can be no more easily distinguished from each other than they.

Among the offences of Joseph's ascendants whose "heinousness cannot be accurately judged," are the cases of Mrs. Mary (Clements) Osgood and Mrs. Deliverance (Hazeltine) Dane, of

Andover, who, in 1692, were supposed for a brief time to be witches. Surely there is something in heredity, for in 1882 their descendant, Joseph Stickney, of New York City, for a brief time was supposed to be a murderer.

WALTER GIBSON.

CONCORD, N. H.

[We must apologize to the rightful bearer of the name for the lapse of memory on our part.—ED. NATION.]

THE REGULARS AND THE NEW SCHOOL.

TO THE EDITOR OF THE NATION:

SIR: Since you have been reproached by so many of your constant readers for the article on 'Doctor and Patient" in your penultimate number, it may be balm to your wounds, even at this late day, to be assured that there are other readers, equally constant, who rejoice that you have touched upon subjects the fair discussion of which is persistently excluded from "regular" medical journals. An opportunity is now afforded, I trust, to discuss the questions of dogma and science, to which the whole quarrel between regularity and irregularity may be reduced, and I only regret that any delay should have occurred in offering such explanations as much in the spirit and letter of your "regular" correspondents demands.

Without attempting to answer any of their propositions directly, allow me to state the position of the homœopaths in as few words as the subject will permit.

They are said to be quacks for adhering more or less strictly to a therapeutic principle or law. If their adhesion is strict, they are called fools; if lax, "knaves," with all its variations, is the word; and under all circumstances, whether the cases may be those in which the question of administering drugs is uppermost or not, their patients are denied the comfort of a consultation with members of the dominant school, who declare that no general law expressing the relation of drugs to morbid conditions can exist.

Even if the homœopaths held that any one theory could explain the action of all remedies in all diseases, and that their principle were such a theory, they would not, in view of the extreme uncertainty of all matters pertaining to therapeutics, deserve all the opprobrium their enemies seek to cast upon them, absurd as such a proposition would be. But the fact is, that the great majority do now, as they have done from the beginning, refuse to admit that their law partakes in any sense of the nature of a theory, dogma, or article of belief. They claim for it no other attributes than belong to any physiological principle which formulates the recurrence of certain phenomena under certain conditions.

A very large proportion, if not the majority, of "laws" governing, as we say, the course of vital phenomena, are principles of this kind, as I need hardly remind you, and they vary in the certainty of their operation according to the degree of exactness with which the conditions necessary for their manifestation can be supplied. Unless due allowance is made, however, for habits of speech, it is wrong to say of them that they "govern" phenomena, or are operative in producing effects, as they are, I repeat, no more than observed uniformities or formulæ expressing the more or less regular occurrence of events under given conditions. The equality in the number of male and female births, taking the year together; the increase in the number of suicides at certain seasons; the fact that substances containing nitrogen in very high proportion are powerful poisons, are laws of this kind, as are many of the laws of heredity, the law of chemical affinity, and innumerable others, which will readily suggest themselves to the professional as well as the unprofessional mind. They are not theories or dogmas; neither are they laws of nature in the sense of infallible, immutable, universal, or ultimate laws; nor do they possess the certainty of the majority of laws governing, as we may say here more correctly, the phenomena of the physical world. They are properly classed under the head of empirical laws, inasmuch as they are reached by experience alone and afford in themselves no explanation of the phenomena in which they are exhibited; and sooner or later they may all be resolved into other laws of a simpler nature. Until they are so resolved, however, they remain laws in their own right, as I may say, and may serve as useful rules of art or practice. It is to this class of laws that the formula *similia similibus curantur*—or *curentur*, as Hahnemann more correctly framed it at first—belongs; and the long and repeated discussion of the subject in the homœopathic literature, periodical and other, makes it absolutely unwarrantable on the part of the code-framers of the "regular" school to call it an exclusive dogma, to assert that it is a theory held to explain the *modus operandi* of drugs, or that it has anything mandatory in its nature, like an ordinance, divine or human, to which men must adhere under penalty of expulsion from Paradise or societies chartered by the state.

To have mentioned the matter of empirical laws is to have come directly upon the question of science, the most fundamental of all the questions at issue between the two schools. If it were possible to reach an understanding on this point, the public, and the profession too, would be "immensely advantaged," and all the questions of secondary importance which continue to complicate and confuse the discussion would then fall away of their own accord. The old school continues to follow, in the main, as it has done for two thousand years, the rational or dogmatic method of determining the indications for the use of all its remedies, including drugs—a method which results, of necessity, in a practice essentially allœopathic; a term, by the way, suggested by Hahnemann, and accepted freely and advisedly by the entire profession up to within the last eight or ten years. It is the application of common sense, trained and untrained, logical and illogical, and always biased measurably by tradition, dogmatism, and the imperfections attending all medical education, to every new discovery in the sciences auxiliary to medicine proper, and to every new theory which can be put forward with sufficient plausibility or authoritativeness. In other words, it is common sense turned loose, without guide or compass, among the most difficult of all human problems, and under circumstances the most unfavorable for its clear and judicial exercise, since it is called upon to reach conclusions in the presence of suffering and danger, as well as the consideration for daily bread. In all cases in which the cause of disease or injury is recognizable and readily removable, this method yields the most brilliant results—a fact as cheerfully recognized by the homœopaths as by their opponents. But in the great majority of all the disturbances the general practitioner is daily called upon to treat, in which the cause is remote or matter of mere conjecture, and not to be reached by direct means, common sense, and even the most thoroughly disciplined judgment and reason, are too liable to be wholly at fault, as the history of medicine even in our own day amply shows.

The new school, on the other hand, follows the empirical method in seeking to establish clear and practicable indications for the use of drugs, for which substances it claims a curative power which may or may not be independent of its physiological action. It takes such correlated facts as accident or experiment has brought to light, and by induction infers from them a law or principle which it then converts into a rule of practice. Such facts are the countless instances of similarity between the physiological effects of drugs and the phenomena of such morbid processes as are removable by them. To collect and sift these facts, to find as nearly as possible the conditions under which they occur, and to reproduce them by experiment, is the scientific task of the new school, while its art consists in applying the knowledge thus gained in practice. In the exercise of the healing art, therefore, it is, to quote a line of Pope's, "led by a rule that guides, but not constrains"—a point never to be lost sight of; for where other more direct and speedy measures are plainly indicated, or where no curative reaction can be looked for, its application ceases.

Since this principle deals with facts for the most part unexplained and unexplainable, and since the conditions under which it must be applied are ascertainable only in a limited measure, the liability to error and failure in its use is necessarily great; and we recognize, moreover, the difficulty of determining whether a recovery has taken place as the result of the medicine administered, or independently of it. But with all its limitations and imperfections, and with all the folly, confusion, and misconstruction surrounding it on all sides, it is a step in the direction of reform in therapeutics which it is impossible to value too highly, or to abandon at the dictation of any code of ethics. It represents the first conscious and systematic effort in the history of medicine to apply the inductive methods to pharmako-dynamics, or drug-action—by no means the most insignificant part of therapeutics; and the more faithfully these methods are followed in the production of new facts and the elimination of error, the more speedily will an independent science of therapeutics be established, and the more certain will be the healing art. In dealing with this subject, it is always to be remembered that the "science" of an inexact or conjectural science like medicine lies much less in its theories, or even in its results, than in its methods, and that all sciences, to be worthy of the name, must be inductive at first.

Much of what you say in your article on "Guiteau and the Experts" in the same number of the *Nation* which brings the expressions of grief and reproach from your "regular" correspondents, bears directly on the subject of the claims of those who hold themselves to be the custodians of science. I beg to recommend it to your correspondents for their calm and dispassionate re-perusal.

Obediently yours, W. W.

CAMBRIDGE, MASS., July 9, 1882.

Notes.

THE ninth of the "Q. P. Indexes" is the first to bear the name of the industrious and disinterested compiler, Mr. William M. Griswold, A.B. (Harvard), now assistant librarian in the Library of Congress. It is a 'General-, Autor-, und Sachregister zu Zeitschriften meist historischen Inhalts,' or subject and author index particularly to the *Historische Zeitschrift*, *Unsere Zeit*, and the *Historisches Taschenbuch*. The last, according to a table on the back of the title-page, dates from 1830; the other journals from 1859 and 1857 respectively. Mr. Griswold, still possessed by the reformatory spirit, introduces the American Library Association's conventional initials for Christian names (as R;=Richard,

R.=Rebecca), and dispenses with the capital initial for substantives. For the rest, the Index resembles in all respects its English predecessors in the same series. It may be had, like them, at Bangor, Maine, or abroad of K. F. Köhler, Leipzig.

We have received a little brochure of eight pages, constituting a 'Bibliography of the Bacon-Shakespeare Literature,' compiled by W. H. Wyman. Its sixty-three titles are all, save two, in Mr. Wyman's library. No. 62 is a partial bibliography contributed by the same hand to the Madison (Wis.) *State Journal* of April 24, 1882. No. 1 is rather a forerunner than a part of the controversy, being "the first known article questioning the right of Shakspere to the authorship of the Shaksperian dramas" ('The Romance of Yachting,' New York, 1848).

An essay on the απαξ λεγόμενα in Shakspere was lately read before the Wisconsin Academy of Sciences, Arts, and Letters, by Prof. James D. Butler. By his actual count, in Schmidt's 'Lexicon,' he found that 364 words beginning with A occurred only once, and 310 beginning with M, or nearly one-fifth of our entire stock of M's. He accordingly estimates the whole number at 5,000 and upwards. A small proportion are compounds. In nine nearly consecutive lines relating to Queen Mab ("Romeo and Juliet," I., iv.) there are nine of these once-used words, including *grasshoppers*, *film*, and *benefice*. Even *variety*, in "Nor custom stale his infinite variety," occurs nowhere else in Shakspere's plays.

Mr. W. S. Kennedy prints, in the *Literary World* for July 15, "An Emerson Concordance: Being a Partial Index to Familiar Passages in his Poems." So much trouble calls for more—a complete Emerson vocabulary, for prose and poetry, worthy of so great a master of the English tongue.

Still another series of novels is promised—"The Kaaterskill Series," of which G. W. Harlan & Co. are to be the publishers. 'A Fair Philosopher' and 'A Modern Hagar' are the first announced, "from the pens of two leading novelists." The volumes will be cloth-bound, and have a uniform price of one dollar.

Houghton, Mifflin & Co. have issued, in a pretty form, with limp covers, a collection of poems on horseback-riding, called 'In the Saddle.' Almost everything is here, from Shakspere's description of a horse, in his "Venus and Adonis," to Joaquin Miller's "Kit Carson's Ride," not omitting translations from Körner, Bürger, and Rückert. "Balder" is the only significant, as well as beautiful, poem which we happen to miss, and his ride was by no means a dash like Paul Revere's, or John Gilpin's, or that which "brought the good news from Ghent to Aix": "Nine days rode he deep and deeper down."

The Executive Committee of Iowa College, whose buildings were so sadly wrecked by the cyclone which lately fell upon Grinnell, utter an appeal for aid. This institution has been particularly unfortunate since its incorporation in 1847. It had not fully recovered from the disastrous fire of 1871. The direct loss by the storm was not less than $75,000.

The Washington and Lee University, Virginia, conferred, at its Commencement in June, the degree of Ph.D. on the basis, for the first time, of definite study and the passing of an examination. The post-graduate course required covered two years; the subject was the English language.

Mr. Salomon Wiener's reflections upon law compose what he calls his "Monthly Mirror of Justice"; the first instalment, on capital punishment, etc., bearing date of June, 1882 (New York).

The first number of the weekly *Dominion Review* is before us—one more effort to establish a national critical journal (Montreal: Wm. Drysdale & Co.). We can at least say of it that it is a serious and respectable enterprise. As regards the National Policy, it is decidedly for free trade. It has at present but two departments—political and literary. From its Table-Talk we make the following extract: "It is not generally known that Mr. Grant Allen, whose writings have attracted so much merited commendation of late, is a Canadian." Nor, we will add, could this fact be ascertained from the latest edition of 'Men of the Time,' from which Mr. Allen's name is wanting.

News to us, also, it is that the Agassiz Association, of which the central chapter is at Lenox, Mass., has now upward of 275 chapters, and a membership exceeding 3,000. It was originally started as a children's society, and its organ is still the *St. Nicholas* magazine; but "parents and teachers have taken as great interest in it as the younger ones." How to organize a chapter is told in the 'Hand-Book of the St. Nicholas Agassiz Association,' just published by Mr. Harlan H. Ballard, Principal of the Lenox Academy. It contains, besides, instructions for collecting, preserving specimens, etc.

The American Forestry Congress, presided over by Commissioner Loring, of the United States Department of Agriculture, will hold its first session at Montreal on August 21, 22, or two days before the assembling of the American Association for the Advancement of Science in the same city.

The latest forestry bulletins of the Census Bureau (Nos. 15, 16) show the pine and spruce supply of Maine, and the chiefly black spruce supply of New Hampshire and Vermont. In Maine the virgin forest is now reduced to a petty area about the head waters of the St. John River, while the hemlock is confined to the eastern quarter of the State. The devastation of the white pine is the marked feature of the other map.

The *Antiquary* for July (London: Elliot Stock; New York: J. W. Bouton) has a short obituary notice of the late Col. Joseph Lemuel Chester, regretful and laudatory, like those in other English journals. It makes, however, the mistake of saying that Colonel Chester, "upwards of twenty years ago, sat as a member of Congress." No person of that name, we believe, ever did so.

The *Athenæum* is about to print a series of hitherto unpublished Byron papers, including an extensive correspondence, which "will be found to demonstrate the baselessness of the various statements made by Lady Byron in her later years to her sister in-law's discredit."

B. Westermann & Co. send us the first number of *Gallia*, a monthly periodical, edited by Dr. Adolf Kressner, at Cassel. Its aim is, neglecting all Romance idioms but old and new French, to pass in review all departments of current French literature. The form is octavo, pp. 36; the type Roman and large-face. The contents of periodicals, learned and literary, are noted and commented on, and there is a list of new publications.

—The English Executive Committee of the Darwin Memorial (the form of which has not yet been decided, but will probably include an endowment for a scholarship to carry on biological research) have invited the aid of an American committee. The following eminent scholars and scientists have consented to serve in that capacity: Asa Gray, Chairman; Spencer F. Baird, James D. Dana, Charles W. Eliot, D. C. Gilman, James Hall, Joseph Le Conte, Joseph Leidy, O. C. Marsh, S. Weir Mitchell, Simon Newcomb, Charles Eliot Norton, Francis A. Walker, Theodore D. Woolsey, and Alexander Agassiz, Treasurer. Subscriptions may be sent to Mr. Agassiz at Cambridge, Mass., and will be duly acknowledged and forwarded. We cannot doubt that a large number of Americans will be found eager to take part in the world's tribute to the greatest discoverer of the age.

—The "Midsummer Holiday Number" of the *Century* is unquestionably the best of the magazines for August. It contains another instalment of Mrs. Burnett's "Through One Administration," a novel which promises to be fascinating to the heart of woman, for whom, after all, are not most women's novels written? As a picture of society we may have something to say of this tale when it appears in its completed form, but it is not as a picture of society that any young lady interested in that wonderful mystery which the relations of the sexes presents to her mind, is reading it now. The central figure is a woman who has married the wrong man, and is in love with the right one, and miserable because she is in love with him. He is a good man, but not good enough to go away and stay away; and hence complications of the most terrible and soul-wrenching character are threatened. There is another man who is also in love with, or at any rate deeply interested in, Bertha, and who seems to have a good deal of influence over her, and who begins in the current number of the story to be almost as *de trop* as the husband. He of course knows nothing of the tragedy which is taking place in his wife's heart, and is evidently going to come to grief of some kind before long. Then there is the father of Bertha, who watches his daughter's career with a kindly paternal affection, but seems hardly competent to do more than watch. Altogether it is a story to interest greatly any alert foreign observer of American manners, like M. d'Haussonville, for instance, very much, though what he would make out of it is another thing. There are several illustrated articles—the "Borderlands of Surrey," by Alice Maud Fenn; the "American Museum of Natural History," by J. B. Holder; "An Aboriginal Pilgrimage," by Sylvester Baxter; "Some English Artists and their Studios," by Cosmo Monkhouse; and "Steam Yachting in America," by S. G. W. Benjamin, being the most important. Mr. Robert Grant, the author of "The Confessions of a Frivolous Girl," contributes a burlesque called "The Lambs, a Tragedy," which tells the sad story of the shearing of Phipps, a Wall Street lamb, through the alternate fall and rise of the stocks which he buys and sells as "flyers." The plot is hardly varied or novel enough to be amusing, but some of the verses show a good deal of burlesque imitative power. The Chorus of Bulls, descriptive of the two great economic laws which govern Wall Street, chants with a real classic feeling:

> "There is a law, as grim and grave as death,
> Which now we know, but then we did not know,
> That whosoever buys, though boasted cheap
> As dirt from ditches, the accursed thing
> For which he hath not in his private purse
> The power to pay, shall surely come to grief.
> And he who sells, although the market soar
> High as the kite which kisses the chaste sky,
> The baleful property he does not own,
> With hopes to cover his defenceless "shorts,"
> Before the advent of the settling day,
> Shall surely lick the dust; and this is fate."

—John R. G. Hassard contributes an interesting article on "How Wagner Makes Operas" (the frontispiece of the magazine is a portrait of the composer), which gives as good an account of his theories of musical and dramatic composition and of the true relation between the arts as we have seen anywhere. It is the article of an enthusiast rather than a critic, who seems incapable of perceiving the weak side of his master. Wagner's early determination to "write poetry

like Shakespeare's and marry it to music like Beethoven's" would hardly strike us as more than the expression of the aspiration of an ambitious boy, if there were not in his whole career something which suggests that the prophecy sprang from a less amiable quality than ambition. Mr. Hassard points out that the great rule of lyric composition which he has made the fundamental principle of opera, and with which he may be fairly said to have laid the theory of Italian opera in ruins, is that of correspondence between the poem and the melody. It is, as Mr. Hassard points out, often a matter of opinion whether a given musical phrase fits a given verse or not; but there are practices of the Italian composers which are hardly open to discussion. The conventional rules of Italian opera (which are admirably burlesqued, by the way, in "Pinafore") were a musical growth solely, the parts of the whole bearing a simply musical relation to each other, and the dramatic part being entirely subordinated to them. It was owing to this that Wagner's early efforts at reform met with such violent opposition. It was felt that he was not a reformer so much as a destroyer, and that what he wished to introduce was not opera at all, as hitherto understood, but a new thing, which must in the end drive out the old altogether.

—*Lippincott's Magazine* has a readable article on "Shires and Shire Towns in the South," by Anthony Van Wyck, which recalls the fact that with all its barbarism and slavery there was a great deal of truth in the old Southern idea of there being something English about the Southern planters and their lives. They were not much like modern Englishmen, but they had retained a great many English habits of thought and ways of life as they existed at the time of the Revolution, when every American gentleman made it a point to be as English as he could in his house and way of life and thought. After the Revolution the South remained stationary, while England and the rest of the world moved on and underwent all sorts of social modifications; but the Southern planter and country gentleman kept alive a good many English country traditions a hundred years later than they lasted in England. It was the same with literature. The Southerner's ideas of literature down to the time of the Rebellion were still those of the contemporaries of Addison and Goldsmith; the Southern political style copied that of England a hundred years ago, and the limits of advanced thought were marked by an admiration for Byron. They preserved, as Mr. Van Wyck points out, the old ceremonious manners of the last century long after they had disappeared elsewhere. A few of the old half-English shire towns are still left—each one a little capital, and local centre of society, and forum for the administration of county justice—languid and empty in midsummer, but a scene of great activity at certain times in the year, when the entire surrounding population comes into the town. Mr. Van Wyck declares that were you "privileged to enter one of the grand old places" on the outskirts of the town—

> "you would often find here groups of polished gentlemen and ladies, with a courtly grace, slightly tinctured with the old ceremonious manner, exchanging the commonplaces of ordinary conversation with a social ease and vivacity unsurpassed by any English-speaking people. The gentlemen have made the European tour in their early years; have seen Washington at its best; have heard Clay and Webster, Calhoun, Marshal, and Prentiss; have ridden the circuit themselves perhaps, and crossed swords with Berrien, or Stephens, or Toombs, in their prime, or with the Heywards, Pettigrew, or Legaré. The ladies have been educated at Macon, or at Columbia, or at Northern schools; have passed summers without number at Saratoga or Cape May; have flirted at Washington with many of the magnates of their generation. Without any pretensions to learning or the slightest tinge of *blueness*, they are always delicate, refined, often elegant, and have a grace and piquancy of their own which, joined to their acknowledged domestic virtues, have justly won for them an exalted place among American women."

But surely this is rather a reminiscence of the dear departed past than a picture of anything that it is very easy to meet with at this moment.

—The *Atlantic* publishes with its August number a supplement containing a full and particular account of the Birthday Garden Party to Mrs. Stowe, with a list of the guests, and the addresses and poems. This is in part interesting and in part "valuable for purposes of preservation," which is more than can be said of everything that is published in the magazines of the month. We can hardly imagine any one, for instance, desiring to preserve the current instalment of Mr. Hardy's "Two on a Tower" very long. Mr. Hardy seems to be struggling along without any definite idea as to what he means to do, and trusting to the fact that a serial story must be continued from month to month to bring him out all right at the end. "Studies in the South" contains nothing very new; the picture of the South presented by Mr. Harrison has been anticipated to a great extent in the newspapers. Northern Democrats, who, as a class, need all the instruction they can get from any quarter, would do well to look at what he has to say in this number about the Southern view of "subsidies" and centralization. The Democratic sages who are in the habit of trying to foster a belief in the party that the South will help them when the time comes for a strict construction of the Constitution and a limitation of the powers of the central Government, are undoubtedly making a profound miscalculation. The Southerner does not understand, since he has been made to suffer from "centralization" in the war, why he should not have all the benefits that centralization can give in time of peace. Centralization then, to his mind, meant loss of property and life, and the general ruin of the country. Centralization now seems to mean subsidies for any one who wants them; a general use of the treasury to fill private pockets, his own included, and thus make good the damage inflicted upon him by his adhesion to the lost cause. "Across Africa," by Charles Dudley Warner, is a pleasant bit of description of a kind at which Mr. Warner is an adept. Mr. Bishop's "House of a Merchant Prince" begins to hold out promise of revelations of financial irregularities on the part of one of the most respected and trusted of his characters. Mr. W. T. Harris contributes an article on Emerson, which contains some interesting bits of criticism, though written in a somewhat metaphysical vein. Dr. Holmes and "H. H." have two poems, and there is an article called a "Study in Sociology," by M. A. Hardaker, which shows that the writer is studying sociology very hard indeed.

—*Harper's* for August offers, amid much that is readable, little that calls for remark. The scenic beauties of Wisconsin, and particularly of the river which bears the name of the State, are authentically illustrated with pen and pencil in Mr. John A. Butler's paper entitled "Some Western Resorts." Mr. Higginson begins his new popular history with "The First Americans," and discusses Morgan's pueblo theory with the aid of graphic representations. He objects that the artistic achievements of the Central Americans, particularly in sculpture, make the identification of their "palaces" with communal houses incredible, and imply a degree of development more in accordance with Spanish traditions than with a restoration based on the study of the pueblo dwellers of to-day. He cannot accept "the assumption that all the delicate beauty and all the artistic skill of the Yucatan edifices were lavished upon communal houses, built only to be densely packed with Indians 'in the Middle States of Barbarism,' as Morgan calls them." The question, however, should not be approached with assumptions on either side. No one can any longer doubt the validity of the clews furnished by the Iroquois social system and Long House, or that the communal system has been surely traced from the Great Lakes to beyond the Rio Grande. The search for missing links is still going on upon this line. Meantime all our knowledge of savage races, past and existing, proves that attainment in art invariably outstrips social progress, and that equality in it does not imply identical social or political institutions. We pointed out the other day the parallelism between the textile products of the Alaskans and the ancient Peruvians; but who would undertake to infer from this a common form of government or a common architecture? For more light, by the way, on the aboriginal art of the Pacific Coast, one may read in the current *Harper's* Mr. Dawson's account of the Haidas of the Queen Charlotte Islands.

—News reached this country on Monday of the death, at Vallombrosa, of Mr. George Perkins Marsh, for more than twenty years United States Minister to Italy, and one of the foremost American scholars and authors. Mr. Marsh was born with the century, and in March last entered upon his eighty-second year. He was a native of Vermont, a State which has always known how to bring its best men to the front and keep them there. He graduated from Dartmouth in 1820, and speedily gained a leading position at the bar. Obeying the tendency to drift from law into politics, he was first chosen to the councils of the State, and afterwards to Congress, where he served for seven years, and until, in 1849, President Taylor offered him the Turkish mission. Three years later he was charged with a special mission to Greece. The years 1854–60 were spent in his native country, and then, as one of the first acts of Mr. Lincoln's administration, in March, 1861, he was appointed to the post from which no succeeding administration ever had the face, if it had the thought, to remove him. In time he became the dean of the diplomatic corps in Italy. Mr. Marsh's earliest as well as latest studies were in the domain of philology. In 1838 he printed a 'Compendious Grammar of the Old Northern or Icelandic Language,' compiled and translated from Rask. In 1859 appeared his 'Lectures on the English Language,' and in 1862 his 'Origin and History of the English Language,' both of which went through many editions. But his mind had also a singular aptitude for practical science, and was ready, at the bidding of the Vermont Legislature in 1847, to make a report on the artificial propagation of fish, or to prepare for the Smithsonian Institution in 1854 an essay full of delightful learning on the camel, with reference to its introduction in the United States. How wide had been his observation and his notes was first realized when, in 1864, he brought out the fascinating study originally called 'Man and Nature,' but afterwards more exactly described, in a revised and enlarged edition, as 'The Earth as Modified by Human Action.' This work, which must always give pleasure to the reader, was translated into Italian under the author's supervision, with fresh amendments. Mr. Marsh's style was remarkably perspicuous, and his writings stand almost alone among those of his countrymen in their combination of literary grace with ex-

treme intellectual versatility. His strength of fibre is shown by the age at which he produced what might be thought his most enduring monument, 'Man and Nature.' For years after that, however, he wrote freely for the press. To the first volume of the *Nation* (July–December, 1865) he contributed a striking series of articles, entitled "Were the States Ever Sovereign?" and to the third and fourth volumes some admirable "Notes on the New Edition of Webster's Dictionary." A few other titles which belong to this period will show the wide range of his interest: "Pruning Forest-Trees," "Agriculture in Italy," "Old English Literature," "The 'Catholic Party' of Cesare Cantù and American Slavery," "The Excommunication of Noxious Animals by the Catholic Church," "Female Education in Italy," "The Education of Women," "Protection to Naturalized Citizens," "Mont Cenis Tunnel," "Physical Science in Italy," "Proposed Revision of the Bible." At the age of seventy-five he reviewed for these columns at great length Colonel Yule's 'Marco Polo'; at seventy-six, Boccardo's 'Dizionario Universale di Economia Politica e di Commercio'; at eighty, he contributed (*Nation*, No. 815) a charming "Biography of a Word." A month later came the review (his last), in the form of a letter, of Lanciani's great work on the "Aqueducts of Ancient Rome." Mr. Marsh's mental vigor and youthful enthusiasm remained with him, as these articles show, absolutely unimpaired to the end of his venerable career.

—The Index Society has issued its third Index of Obituaries. The first, for 1878, had only 6,000 names, the second had 12,000, and the third, for 1880, must have nearly16,000. The increase this year is partly due to the collaboration of American librarians, who have worked for this very much as they worked for Poole's Index. For 1881 there will be even greater additions from American sources. Now that we have shown that the thing can be done, it is to be very much wished that France and Germany could be persuaded to join forces. Such an annual index is one of the necessities of civilization. But this yearly list alone is not enough. Its use in the future would be greatly facilitated by a decennial index of the Index, referring in the briefest form (Abney, 80) to the years in which the full reference is given. By the use of small type, four columns to a page, the family name alone being used except when there are two of the same name, an index for ten years could be compressed into a volume no thicker than the one before us, of one hundred small quarto pages.

—In a late session of the *Académie des Inscriptions et Belles-Lettres* M. Miller read a translation of several hitherto unpublished fragments of Ælian which he had discovered in a manuscript. They were in a double sense *anecdota Græca*. One or two may be worth quoting. A certain queen of Cyprus, Demanassa, whom no other author has mentioned, made three laws: that adulterous women were to have their hair cut, and be delivered to prostitution; that men guilty of suicide were to be deprived of burial; and that he who killed another's ox should himself be slain. Now Demanassa had a daughter and two sons. The daughter committed adultery, one of the sons committed suicide, and the other killed his neighbor's ox. The laws were strictly executed in all three cases. Some one blamed Euripides for going to market himself when Sophocles left that task to his slave. "Yes," said Euripides, "Sophocles eats what his slave prefers, and I eat what I like myself." Diogenes, seeing a woman swept away by a torrent, cried out, "There goes an evil carried away by an evil evilly."

—The literary recollections of M. Maxime Du Camp, which have already been noticed in these columns, are still running their course in the *Revue des Deux Mondes*. He devotes a chapter to Beaudelaire, one of Mr. Swinburne's sad-mad-bad-glad brothers. When Charles Beaudelaire was fourteen years old, his mother, a widow, married Colonel Aupick, of the French army, a martinet whose ideas concerning the education of youth were as ill-adapted as possible to curb the rebellious spirit of his stepson. The result was a series of quarrels, culminating in a pitched battle, on the occasion of a grand official dinner given by Colonel Aupick in his capacity of chief of staff at Lyons. Beaudelaire was packed off to India, where he took contracts to furnish the British troops with cattle, and made a living as best he could, being aided by his mother with occasional surreptitious remittances. Being but seventeen years of age, he acquired a thorough knowledge of English. He lived also some time at the Cape. When he returned to France he was of age, and entered on the enjoyment of his patrimony. While it lasted, which was not long, he led a life of conspicuous elegance. His mother made an effort to introduce him into the best society, but his contempt for the social amenities soon closed all doors against him. He felt more at home in cafés and wine cellars, where a generation of the great men of the future listened as he recited his unpublished verses, and rewarded him with unstinted applause. In this way he acquired a sort of small reputation in the editorial rooms of the minor journals, even before he had printed anything. Although he never fulfilled the high expectations which were entertained in some quarters, he occupies an important place in the second rank of the poets of his time. M. Du Camp gives an amusing account of the way in which he made the acquaintance of Beaudelaire:

"He called on me at a small country house at Neuilly, which I had taken for the summer of 1852. His dress and general appearance were eccentric, and although evidently possessed of much muscular strength, he had a wasted and jaded look. The beginning of our conversation was odd. He said, 'I am thirsty.' I offered him beer, tea, grog. He answered, 'I thank you, but I only drink wine.' I asked whether he preferred Bordeaux or Burgundy. 'If you allow me, I will take both.' A bottle of each was brought, a glass, and a decanter of water. He said, 'Please have that decanter taken away: the sight of water is disagreeable to me.' During the hour that our interview lasted, he emptied the two bottles, swallowing a tumbler-full at a time. As I noticed that after each potation he watched furtively, to see what impression his conduct was producing, I remained quite impassive, laughing in my sleeve. His originality, although great, was often put to a great strain by the efforts he made to display it. One Sunday he came to my house with his hair dyed green. I pretended not to notice it. He stood before the glass, looked at himself, passed his fingers through his hair, and generally made a desperate attempt to attract attention. Not succeeding, he asked me: 'Don't you think there is something strange in my appearance?' 'Why, no' 'But my hair is green: surely that's uncommon.' I replied, 'Everybody's hair is more or less green; now, if yours were sky-blue, I might be surprised, but green hair you will find under every hat in Paris.' Almost immediately after he went away, and, on his way out, meeting one of my friends, he said, 'I would advise you not to call on Du Camp to-day: he is in a horribly bad humor.'"

—Notwithstanding his peculiarities and his shiftless mode of life, Beaudelaire was undoubtedly possessed of considerable talent. As a poet, his range was limited; but within his limit his strength was great. As a prose-writer, his translations from Poe were a masterpiece. He had an innate sympathy with the American writer, whom he first made known in France, and with whom he had completely identified himself. Without being aware of it, he had one great defect, which, for a writer, was a fatal one—he was ignorant. What he knew he knew well, but it was little. History, physiology, archæology, philosophy, escaped him; in fact, he never cultivated them. He had been through the colonies, Southern Africa, the Indies, and brought back nothing. He seemed to have travelled with his eyes shut. He was a subjective poet, and the external world interested him but little. He may have seen it, but he certainly never studied it. Whatever attention he devoted to it was solely for the purpose of discovering the vices which should justify him in his contempt for the human race. When his "Les Fleurs du Mal" appeared in the *Revue des Deux Mondes* for June, 1855, they created a sensation and achieved a success. The success was only heightened when his poems appeared in a volume and the Government committed the blunder of proceeding against them as an offence against the public morals. There was nothing in them that warranted such a charge, and, as always happens in such cases, and always will happen, the book attained a popularity which was perhaps not greater than its merits deserved, but undoubtedly greater than it could otherwise have reached in so short a time. Notwithstanding this piece of luck, fortune did not smile upon him. Ultimately he fell into a paralysis of the faculties, and ended his days in a mad-house.

—M. Babelon has published an interesting memoir in which he traces the commerce of the Arabians much further north than it had hitherto been supposed to go. The Arabs appear to have started from the Caspian and followed the course of the Volga to the Baltic Provinces, and then to have spread around the Baltic over the shores of Russia, Sweden, Denmark, Germany, and some distance up the rivers. The evidence consists in the Arabic coins found in all these places. Of course this is not proof positive that the Arabian merchants themselves had penetrated so far, any more than the great quantity of Canadian silver that circulated here during and after the Civil War is a proof that we were overrun by Canadians; but it is certain that the Arabians had a very considerable commerce in early times with these hyperborean regions, whether they penetrated to the North Sea themselves or not. We say "early times," because no coins are found later than 1040, indicating that the commerce had ceased not long after that date.

—Eight years ago the sixth edition of the 'Geographisch - statistiches Lexikon,' called "Ritter's" by way of trade-mark, appeared, and now we have the first instalment (A–Anne) of the seventh (Leipzig: Otto Wigand; New York: B. Westermann & Co.). A new editor has been employed, Dr. Heinrich Lagai; the size of the page has been enlarged in both dimensions; and we may readily take the publishers' word for it that a significant increase will be made in the number of titles. In fact, the sixty-four pages before us stop at a title which is found on the 52d page of the previous (smaller) edition, while every effort has been made to keep down the bulk by omissions and contractions. The abbreviations have been multiplied to a degree which makes consultation much less easy for a foreigner. A very slight examination shows that the articles have been extensively revised and rewritten, and that the censuses of 1880 have been availed of. Egypt, Afghanistan, Algeria, and America have noticeably received more attention; Africa has perhaps been slightly condensed. The aim of this gazetteer is essentially to satisfy commercial needs, and its conspicuous merit, apart from other needful qualities, is fulness. Long use of it has satisfied us of its superiority in this respect to any work of the kind we have ever met with. Its principle of

inclusion is, for Germany, Austria, and Switzerland, all places having 100 inhabitants and upward, and baths, factory towns, postal and railroad stations with even fewer. For the rest of Europe, the minimum population is 200 to 500, and for the world at large, 500 to 1,000. This 'Lexikon' must be thought indispensable in every counting-room where German is used or understood; nor should any library be without it.

SEWALL'S DIARY.—I.

Diary of Samuel Sewall, 1674–1729. Vol. III. 1714–1729. Collections of the Massachusetts Historical Society. Vol. vii. Fifth Series. [See *Nation*, Nos. 696, 697, 765, 766.]

THIS, the final volume of the Sewall 'Diary,' containing also an index of the names in the present volume, and what is supposed to be a general index of all the volumes, completes the publication. In several respects the close of the work is disappointing, but in no respect is it so disappointing as in the important matter of the general index just referred to. Judge Sewall's 'Diary' is essentially a work of historical reference. It can never be a popular book, or even in considerable demand with general readers. There is too much uninteresting detail in it; nor is the subject in any aspect a large or inviting one. To the student of New England history, however, it is a mine of necessary information. The 'Diary' brings him directly face to face with the inmost life of the people whose story it is his object to narrate. He cannot, however, even after repeated readings, carry its whole contents in his head, nor can he spend hours rummaging its pages in search of something of which he retains a vague recollection that he has seen it there or somewhere else. To works dealing with the original material of history a thorough index is essential. Without it, half their value is lost. They are merely full of buried treasures.

In this respect the publications of the Massachusetts Historical Society have heretofore been remarkably strong. Their indices have been models of thoroughness. For some reason, which is not apparent, the past reputation of the Society in this respect has not been sustained in the present case. The Sewall index is certainly large enough, for it fills 140 double-column pages; but it is confined to proper names, with simple page-references, unaccompanied by any indication of subject-matter. For instance, under the perfectly meaningless title of "The Governor"—a title of no conceivable use to any investigator—there are 544 page-numbers in close succession without one word of explanation. Under that of Cotton Mather there are some 300; under that of Joseph Dudley, some 200; as many under New England; while under Boston there are no less than 476. An investigator, therefore, looking to see if there is anything in Sewall on a particular point connected with the history of Boston must worry through 476 citations before he can satisfy himself whether it is there or not. Hunting for a needle in a hay-stack is nothing to this. Such work, we submit, is not index-making: it is an exasperating sham. The purpose of an index is to lay open easily to investigators the whole contents of a book. Merely to pile up columns of page citations does not lay open the whole contents of any book, and is little better than a pure waste both of the time of the compiler and the money of his employer. In this case it is to be hoped that a proper and intelligent index will be found in the final volume of the series of the Historical Society's Collections, of which the 'Diary' will be a part. If it is not found there, the value of this work to the historical student will be very seriously impaired.

Turning to the third volume in itself, it will be found to cover the period from May, 1714, to October, 1729, or from the sixty-second year of the writer's life to a few months before its close, on January 1, 1730. In public affairs this period was almost identical with the reign of George I., and during it Col. Samuel Shute was Governor of the Province of Massachusetts Bay. Politically, it was far from an interesting or instructive time: it was the day of small things and of slow growth. The colony was just finishing the first century of its existence, and the struggles of infancy were not yet over. The Indian wars had been, it is true, forced back from the Narragansett country and the Connecticut to the wilds of New Hampshire and Maine, but they still continued, and drained the community of its youth and its substance. Indeed, the most dramatic and memorable incident of this whole period was that expedition of 200 men to Norridgewock on the Kennebec, in August, 1624, which resulted in the death of Father Rasle—an event, by the way, no mention of which is found in the 'Diary.' The entire population of the Province was then about 95,000, and that of all New England 160,000; while Boston was a thriving commercial town of some 18,000 inhabitants. Outside of Boston the people were very poor, exacting from the sterile soil a bare living, and nothing more. They wore homespun, used the farming utensils which for centuries had served the needs of Englishmen, ate Indian-corn bread, molasses and salt meat, drank rum and cider, worked early and late in their fields, and attended meeting and town-meeting, and hung about the village taverns.

On the sea-coast, about 150 boats, in which sailed some 600 men, were engaged in fishing; and the Province owned about 190 sail, which were navigated by some 1,100 seamen. The foreign trade of Boston, Salem and Newburyport, in which places all the little wealth the colony had then amassed was concentrated, was carried on with the mother-country, the other Provinces and the West India Islands, and consisted of the exportation of products of the forest and cattle, and the importation of sugar, molasses and rum.

It was a dreary, monotonous, commonplace period—a period without literature, art or science. Cotton Mather was the leading divine of the day, and the 'Magnalia' its choicest product. Sewall was now thoroughly a part of his time and surroundings. His natural taste for music and poetry and finer things had been ground out of him by lifelong contact with the hard, material, superstitious world in which he had his being, and his 'Diary' reveals an honest, frivolous, bigoted, but kindly and affectionate old man, fading gradually away. In fact, it is open to very great doubt whether this portion of the 'Diary' ever ought to have been published at all—whether, indeed, the publishing it, at any rate in full, is not a grievous breach of good taste. It is mainly the domestic record of an old man with whom the dangerous practice of journal-writing had become a settled habit, and who wrote down in his 'Diary,' for what end it is impossible to say, whatever for any day was uppermost in his mind; and domestic and private matters are at nearly all times uppermost in most men's minds. Unfortunately, Sewall's first wife, to whom he had been married forty-three years, and who had borne him fourteen children, died in 1717. He was then Chief-Justice of Massachusetts, and sixty-five years of age. Twice, however, after that did the old man marry again, once at the age of sixty-seven, and again at seventy; and it is with the details of these marriages and the events which preceded them that the pages of this volume are full. It is, we submit, a record with which neither the public nor the historian has anything to do. The minute details of the courtships of an old man may be very entertaining, but they are not of public moment, nor are they characteristic of the life or the manners of any particular period. They are pure gossip, and gossip of a not very creditable kind. Of such gossip this volume is full.

For instance, the following is highly amusing, but in what way does it concern posterity? It certainly is not history. One feels as if he were a sort of Peeping Tom even in reading such a record in the time-worn manuscript. Hannah, the Chief-Justice's first wife, had died on the 19th of October, 1717. On the 29th of October, two years later, in the presence of a numerous progeny, the old man of sixty-seven is married again, his own son being the officiating clergyman. The bride was Madam Abigail Tilley, born Melyen, who had been twice married before. The marriage took place at Mrs. Tilley's house, between seven and eight o'clock of the evening of Thanksgiving Day, "in the best room below stairs." The following is the venerable bridegroom's account of his wedding-night, now first printed in full:

"Mrs. Armitage introduced me into my Bride's Chamber after she was a-bed. I thank'd her that she had left her room in that Chamber to make way for me, and pray'd God to provide for her a better Lodging: So none saw us after I went to bed. Quickly after our being a-bed my Bride grew so very bad she was fain to sit up in her bed; I rose to get her Petit Coats about her. I was exceedingly amaz'd, fearing lest she should have dy'd. Through the favor of God she recover'd in some considerable time of her fit of the Tissick, spitting, partly blood. She herself was under great Consternation."

THE FUTURE OF ISLAM.

The Future of Islam. By Wilfrid Scawen Blunt. London: Kegan Paul, Trench & Co. 1882.

IT is somewhat difficult to criticise an author who launches forth on the sea of political prophecy and political speculation so fearlessly as Mr. Blunt. In the compass of a brief book of little more than two hundred pages he confidently predicts a new and higher moral and intellectual life for the followers of the Prophet; he reconstructs the map of the Mohammedan world, and assures the British people that the only safe and reasonable policy for them to adopt, if they desire to preserve their Empire in its integrity, is to constitute themselves the guardians of Islam against all its assailants. Mr. Blunt is not so explicit as he ought to have been in stating his claims to be listened to when he asks us to accept upon his authority the probability of such a vast revolution as this. He does not even say if he is acquainted with Eastern languages, or has devoted much of his time and thought to the study of Moslem history; and perhaps, in the absence of any such assurance, we are justified in assuming that he is unacquainted with Eastern languages, and has no special or profound knowledge of Moslem history. At any rate, the only reason which he gives in the book before us why we should accept him as a veritable prophet is that he "visited Jiddah in the early part of the past winter, and that he subsequently spent some months in Egypt and Syria in the almost exclusive society of Mussulmans." This, assuredly, is a very precarious foundation for such a vast superstructure of political prophecy as that which he has thought fit to build upon it; and we think it will not be difficult to show that his vaticinations will not survive the application of reasonable criticism.

Mr. Blunt, then, is of opinion that not merely will the Ottoman Empire cease to exist at no distant period, but that the Moslem portion of its population will, upon its disappearance, be converted to Christianity. He believes that the Moslems in the Khanates of Central Asia are not unlikely to follow this example—that all Northern Africa as far as the ranges of the Atlas will be Europeanized; that Persia will separate itself from the faith of Islam; and that from the remaining portions of the Mohammedan world, but chiefly from among the Arabs, will begin a reformation of Islam that will bring the crude and elementary morality of the Koran into harmony with the moral and intellectual ideas of the nineteenth century. It is this fancy, that the Arabs will impart a higher moral and intellectual life to Islam, which appears to us the most extravagant thing in Mr. Blunt's little book, and convinces us that he has paid very slight attention to the past history of Mohammedanism. He appears to have taken for granted the popular, but altogether erroneous belief, that the civilization of Bagdad and Cordova was due to the Arabs, whereas, in point of fact, it existed in the face of their bitter opposition. The Arabs have always fought against any enlargement of the narrow boundaries of the creed of Islam, have always protested against any attempt to liberalize its doctrines as rank heresy, and they remain in consequence, to this day, in precisely the same condition, socially, morally, and intellectually, as when the Prophet appeared among them.

"It is," writes Ibn-Khaldun, the most philosophical of Moslem historians, "a very remarkable fact that nearly all the learned men who have distinguished themselves among the Moslems by their aptitude in the sciences, whether religious or intellectual, were foreigners. The examples to the contrary are extremely rare; for even those among them who were of Arabian extraction differed from that people in the language which they spoke, the country where they were brought up, and the masters under whom they studied. . . . All the great divines who have dealt with the fundamental principles of the law, all those who have distinguished themselves in dogmatic theology, and the greater part of those who devoted themselves to Koranic exegesis, were Persians—a fact which demonstrates the truth of the saying attributed to the Prophet: 'If,' said he, 'science were suspended from the height of heaven, there are among the Persians those who would possess themselves of it.'"

Bagdad and Cordova owed their transient period of intellectual brilliancy, the former to Persian and Syrian Christians, the latter to Jews and Christians. The Arabs, as Ibn-Khaldun points out in his invaluable 'Prolegomena,' have never done aught but bring ruin and desolation upon every country which they entered. The only purely Arabic movement which has risen up in Islam since the death of the Prophet was the Wahhabee revival, and this, Mr. Blunt himself admits, "took no account whatever of the progress of modern thought," but expected "by force of arms to Arabianize the world again." We are therefore at a loss to conjecture by what process Mr. Blunt has arrived at the conclusion that the Arabs are about to belie the whole tenor of their preceding history, and apply themselves to such a gigantic and, to our thinking, impossible task as the production of an edition of Islam with all the latest religious improvements of the nineteenth century incorporated therein.

Still less is it comprehensible by us how an Islam remodelled after this fashion is to be made acceptable to Malays, Negroes, Kaffirs, Chinese, and others, all of whom, according to Mr. Blunt, only await the proclamation of the new religion to embrace it with fervor and alacrity. Mr. Blunt has apparently been persuaded into believing that a spiritual reformation is at hand because thinking men among the Faithful are deeply dissatisfied with the present condition of the Mohammedan world, with the infidels encroaching upon all its borders. But there is no necessary connection between this dissatisfaction and a reconstruction of the theological and other beliefs which dominate the Mohammedan world. One thing is certain: no religion can rise to a higher level of spiritual life than that of its own fountain-head; and unless it can be shown that the present state of the Mohammedan world is due to a falling away from the primitive creed of Islam, it is idle to anticipate a religious revival infusing life and vigor in its decaying members. Now this, we maintain, it is impossible to show. Whatever other faults may be ascribed to the followers of the Prophet, that of religious inconstancy cannot be numbered among them. Intellectually and morally, they have presented an impregnable opposition to the advances of Western thought, and clung, through good report and ill report, to their Prophet and the legal systems which have been deduced from the Koran. Although not explicitly clothed with divinity, the Prophet holds, in the faith of the Moslem, a position very similar to that of Christ in Christianity. Every sound, orthodox Moslem believes that in every act and saying of his life Mohammed was under a divine guidance which has made of him a pattern and example for all generations to come. Slavery, polygamy, concubinage, divorce, religious war, intolerance—all the practices, in short, which have wrought the greatest havoc in the Mohammedan world—are not merely sanctioned, but commanded, by the example of the Prophet. It is impossible for any Moslem to call them into question without at the same time calling into question the sanctity and wisdom of Mohammed—without, in other words, cutting himself off from the company of the Faithful. Mr. Blunt's expectation of a spiritual reformation of Islam is all the more remarkable because he does not anticipate that the pilgrimage to Mecca and the honors paid to the black stone will hereafter be performed with less fervor and depth of conviction; but if the Moslems ever arrive at the conviction that the Prophet was wrong in all that he taught and practised regarding slavery, polygamy, concubinage, and religious war, it is tolerably certain that they must arrive at the same conclusion regarding the silly and unmeaning ceremonial of the Mecca pilgrimage.

Mr. Blunt's last chapter is devoted to "England's Interest in Islam," and in this he gravely propounds a policy for Great Britain which it is difficult to read without laughter. "On the downfall," he says, "of the Ottoman Empire, whenever that event shall occur, the rôle of England in regard to Islam seems plainly marked out. The Caliphate—no longer an empire, but still an independent sovereignty—must be taken under British protection and publicly guaranteed its political existence, undisturbed by further aggression from Europe." To afford this protection with the smallest cost and trouble to itself, Mr. Blunt is of opinion that Great Britain ought to see that the Caliphate of the future be set up in Mecca, and when this has been effected the same much-enduring Great Britain ought, according to Mr. Blunt, to make of the pilgrimage a sort of Cook's tour, "personally conducted" by itself. "A systematic development of the pilgrimage as a Government undertaking, with the construction of a railway from Jiddah to Mecca and the establishment of thoroughly well-ordered lines of steamers from the principal Mohammedan ports—all matters which would amply repay their cost—would every year add a new prestige to English influence." Mr. Blunt has omitted, probably by accident, from this admirable programme the erection of a number of monster hotels in and around Mecca, with a staff of "thoroughly well-ordered" waiters from London for the accommodation of the pilgrims.

"The mission," Mr. Blunt goes on to say, "is a high one, and well worthy of her acceptance. . . . Nor will her refusal, if she refuse, be without grave and immediate danger. The Mohammedan world is roused, as it has never been in its history, to a sense of its political and moral dangers, and is looking round on all sides for a leader, of whatsoever name or nation, to espouse its cause. We can hardly doubt that the position of directing so vast a force, if abandoned by England, will be claimed by some more resolute neighbor. . . . The Caliphate is a weapon forged for any hand—for Russia's at Bagdad, for France's at Damascus, or for Holland's (call it one day Germany's) in our stead at Mecca. Protected by any of these nations, the Caliphate might make our position intolerable in India, filling up for us the measure of Mussulman bitterness, of which we already are having a foretaste in the Pan-Islamic intrigues at Constantinople."

After reading this, few will doubt that Mr. Blunt has been indulging to excess in a practice commemorated by Coleridge under the title of "Fancy in Nubibus":

"Oh! it is pleasant with a heart at ease,
Just after sunset or by moonlight skies,
To make the shifting clouds be what you please,
Or let the easily-persuaded eyes
Own each quaint likeness issuing from the mould
Of a friend's fancy."

The European nations, England included, have quite enough on their hands for many years to come without giving up their time and labor to such a work of supererogation as the protectorate of the Mohammedan Caliphate. Mr. Blunt's language leaves it somewhat doubtful whether he expects that Great Britain should take up this onerous duty at once, or defer it until the Ottoman Empire has vanished into the inane and the Arabs have spiritually regenerated Islam. The grammatical construction of his sentences points to the present as the time for entering upon these new duties, but the general tenor of his reasoning would require that it should be postponed until the Arabs have renovated Islam. It is quite certain that at present Great Britain could not construct railways and build hotels on the Sacred Territory for the convenience of the Faithful; and as the Arabian reformation will certainly synchronize with the Greek Kalends, Mr. Gladstone's Government need not be alarmed by the menacing predictions of Mr. Blunt if they do not carry out his policy.

RECENT NOVELS.

Marion Fay: A Novel. By Anthony Trollope. Harper's Franklin Square Library.

Two Old Cats. By Virginia W. Johnson. Harper's Franklin Square Library.

Guerndale. An Old Story. By J. S., of Dale. New York: Charles Scribner's Sons.

MR. TROLLOPE has in 'Marion Fay' written a very long story, and used for it materials that hardly have the recommendation of novelty. There is a Marquis of Kingsbury, who has much trouble with his family, and especially with his second wife; there is his son, Lord Hampstead, who falls hopelessly in love with Marion Fay, a poor Quaker girl; and his daughter, Lady Frances, who engages herself to a post-office clerk, Mr. George Roden. The poor Quaker girl dies, leaving Lord Hampstead inconsolable, while George Roden turns out to be an Italian nobleman, and Lady Frances makes him happy. Then there is a family chaplain who arouses the reader's interest at one time by thinking over a little plan for murdering Lord Hampstead. Actual murder, however, is not at all in Mr.

MALDEN PUBLIC LIBRARY

Trollope's line, and the chaplain's criminal designs do not take the form of overt acts. There is some low comedy introduced through the medium of the adventures of a vulgar young woman named Clara Demijohn and a pair of rivals for her hand. There is a great deal of love, but very little incident; and love-scenes without incident to relieve them are apt to be mawkish. Flatness has always been at once Mr. Trollope's forte and foible, and in 'Marion Fay' the flatness occasionally approaches the point of burlesque. With a man in love tender associations will undoubtedly cluster around any object, however unromantic, that the loved one has touched. But when we have sympathized with Lord Hampstead's interest in a poker because Marion Fay has had it in her hand, we feel that we have done all that should be required of us. Too much poker, even when hallowed by love, palls upon us, and we resent the introduction of it as a serious part of the sentimental machinery of a novel.

Socially, the story has some interest as a picture of the effect of modern ideas with regard to love and marriage on an aristocracy which, like that of England, is already hopelessly hemmed in by the rising democratic tide. There is every worldly reason why Lady Frances should not be allowed to engage herself to George Roden; but no one can prevent it, and the reader feels that it was rather a tribute to aristocratic prejudice and romantic tradition to turn him into an Italian duke at the end. The story would have been much less commonplace had he remained a post-office clerk and married Lady Frances in the face of the whole British peerage. He does, it is true, refuse to take his title, and, consequently, has to keep his mother's name, which is a senseless proceeding, as it is a name assumed by her under the impression that her marriage was invalid. The best-drawn character in the book is that of Mr. Sam Crocker, whose vulgar vanity, self-assertion, curiosity, good humor, and untruthfulness make up altogether quite a perfect modern cad.

'Two Old Cats' is but a trifle of a story, and yet it is not trivial. As heretofore in Miss Johnson's work, the love-story and the lovers themselves are but secondary. We quite know beforehand the handsome and ingenuous pair who, after not too much adversity, happily walk off the stage hand in hand at the end of the play. The charm of the story is its setting—the shores of the Mediterranean. The cats are neither very old nor very bad—the one with paws of velvet, soft and beguiling; the other stern, repellent, always ready for scratches, but both equally selfish and self-seeking (for the conversion of the hero's maiden-aunt is altogether too sudden to be very virtuous). So good material as Miss Johnson's deserves greater pains in putting together, and something more of care is needful to her, or small slips and inadvertencies will grow to serious faults.

A large part of 'Guerndale' is occupied with a description of college life at Harvard about ten or twelve years ago. The rest of the book is an ordinary novel, which, though showing a considerable amount of cleverness, would, without this introduction, not be likely to attract a great deal of attention. It is rather a man's book, and will therefore probably be read by all the women and children who can get hold of it. These should be warned, however, not to put too implicit confidence in the picture given of Harvard. No one not a recent graduate can speak with entire authority on this subject; but it is safe to say that the youthful cynic Randolph and the excessively good Guyon Guerndale are both overdrawn. The author, who is evidently young, has put all that he knows of life into the book, and, being young, his knowledge of life is naturally derived to a great extent rather from books than from observation.

Pictures of college life are almost always disappointing, because they reveal, if they are at all true, an appalling amount of folly and weakness in their heroes, who have lost the freshness of boyhood without acquiring the wisdom of maturity. A college man in the United States is either a hard-working young fellow who aims at qualifying himself for some profession—in which case his career as a student presents few points of interest—or else he is some rich man's son, placed beyond the necessity of work, and who comes to college because it is the most gentlemanly thing to do, or because his father did it before him, or because he does not know what to do with himself. This class is small in all American colleges, but probably is larger at Harvard than elsewhere, and always makes more noise than any other, because it has more time on its hands. It develops in each class, with great regularity, a "fast" set, who ape the vices of men, and make themselves ridiculous in doing so. It is this set which is described in 'Guerndale.' All the hardened young reprobates who compose it are accustomed to drink and smoke a great deal, swear like pirates, gamble, and idle away their time in a very silly way. They consider themselves men, and pass for men among their friends, and talk about their life as a very fine and delightful one. But there is obviously nothing about it that lends itself especially well to fiction. Profanity may be attractive to a boy, just as drinking brandy and water or smoking strong cigars may be, merely because in his innocence he associates swearing and drinking and smoking with the idea of adult maturity and freedom. But the chronicling of his oaths and his debauches is a dreary task, and the tale is one which must, when it is told, make rather a painful record. The author of 'Guerndale' has contrived to make it more entertaining than we should have thought possible by the introduction of Norton Randolph, the cynic to whom we have referred—an amiable pessimist and misanthrope, deeply versed in the latest speculations of the day, always on his guard against excitement or enthusiasm, an agnostic of the agnostics, with the constitution of an Ajax, the wit of a Voltaire, and the profundity of the Stagirite himself. At heart he is a lover of his kind, and stealthily does good in many unexpected ways. His conversation reeks with hopelessness. New England, he declares, "will shortly be the most immoral country we know. And the sinister fact about it is, that its unhappiness and immorality will be found not in the highest classes or the lowest, but in the great middle class, on which the social life and future of a nation depends. We are accustomed to shrink with horror from French novels and French morals: to-day the *bourgeoisie* of France is purer and happier than our own." Again: "Religion has degenerated into a curious social custom. I look at a New England meeting-house in much the same outside way that I should look at a Chinese joss-house—it serves as a sort of social nucleus to a parish where they periodically run into debt and cut down the preacher's salary." Finally, he proposes, "as the only way of impressing the necessity of social, moral, and physical strength on the people, that all criminal, infirm, and insane persons be etherized." These are the perfect flowers of youthful cynicism. To be a cynic of this sort it is necessary to be twenty years old, in perfect health, and completely happy. There may be such cynics at Harvard even now, but they are in real life not so clever as Mr. Norton Randolph, whom the author has to a great extent made his own mouthpiece.

John C. Calhoun. By Dr. H. von Holst. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1882. Pp. 356.

If the series of 'American Statesmen' is in its general character historical rather than biographical—aiming, that is, to present the man in his relation to the national life, rather than to portray him as an individual member of society—this is especially to be expected of Calhoun. The life of John Quincy Adams is one of the most dramatic in history; that of Hamilton is full of incident; but of Calhoun as a man, his biographer says, "but very little is to be told. Even his contemporaries, with perhaps the exception of his nearest neighbors, did not know much of his doings as a private individual. . . . We hear that he was a just and kind master to his slaves, that he was possessed of an uncommon conversational talent, and that he exercised an especial fascination upon young men. That is about all" (p. 4). "Yet it is unquestionably true," he goes on (p. 7), "that the name of Calhoun already conveys a much more definite idea to the American people than that of either Webster or Clay," because "Calhoun is in an infinitely higher degree the representative of an *idea*, and this idea is the pivotal point on which the history of the United States has turned from 1819 to nearly the end of the first century of their existence as an independent republic. From about 1830 to the day of his death, Calhoun may be called the very impersonation of the slavery question."

The volume before us, therefore, appropriately entrusted to the distinguished historian of this epoch, may be described as a history of the slavery question, with especial relation to Calhoun's participation in it. In view of the vital nature of this controversy, and the lack of biographic elements in Calhoun's career, the plan of the book is all that could be desired. It would seem, however, that the personality of its subject is at times unduly left out of sight. The book has become so completely a history of the slavery question—and one, too, treated almost exclusively from the most profound and analytic point of view—that the reader is often left in the dark as to dates and persons. The chapter entitled "Slavery," an admirable sketch of the early history of the controversy, is often defective in this regard; and the chapter which follows, "Under Van Buren," really carries the narrative down into Tyler's administration. We read (p. 172): "Calhoun now took this decisive step," etc. What the decisive step was we are thoroughly informed; but when was "now" the reader is left to guess, for there is not a date within seven pages.

Dr. von Holst has another fault, the common fault of allusiveness. The great majority of his readers will be young men whose memory does not carry them beyond the war of the rebellion, and to whom many of these once so familiar names and incidents are either wholly unknown or call up the most shadowy image. We read, for example (p. 226): "The bursting of the cannon 'Peacemaker' on board the *Princeton*, on February 28, 1844, ended the embarrassment of the Secretary." We venture to say that not half who read this passage will understand that this desired relief came to the Secretary in question (Mr. Upshur) by removing him to another world. In many cases, as in this, the account would be materially improved by a foot-note or a slightly different wording in the text.

These faults—if we may call them such—are much less prominent in the closing chapters on "Texas" and "Oregon and the Mexican War." Mr. Calhoun's relation to these three important questions is portrayed with great perspicuity and a remarkable degree of individuality. As Secretary of State in the Texas negotiations, he is shown (p. 233) to have been guilty of direct

MAILDAY
PUBLIC LIBRARY

falsehood in asserting, in his letter to Mr. Pakenham, that the annexation project was forced upon the United States by the policy of Great Britain. And his attitude toward Mexico and Great Britain in Polk's Administration, honorable and patriotic as a whole, was seriously affected by his fanaticism on the subject of slavery. The "greatest and most fatal political blunder of his whole career" is declared (p. 276) to have been his refusal to move in opposition to the President's Mexican policy, for fear of lessening his influence in the Oregon matter. But Polk had already "made up his mind to satisfy England with regard to Oregon. Calhoun could have crossed the way of the President in the most determined manner, without risking anything except his standing as an 'Administration man,' and that he was sure to lose at any rate."

If Calhoun's career was not a dramatic one, like that of John Quincy Adams, it was in its close tragical in the highest degree. He saw clearly the approach of the "irrepressible conflict" which he had done more than any other man to precipitate; and yet the inevitable result —disunion—was one which he never desired, from which he shrank. "He lived long enough not to derive any consolation from the vain hope that [his] last attempt to save the Union by rendering slavery absolutely safe *in the Union* would be successful" (p. 328). His life may be pronounced incomplete, because he did not live to see the direct and necessary consequences of his own labors; and for the same reason the reader lays down the book with a sense of incompleteness—it is a history rather than a biography, and as a history it needs to be supplemented by a survey of the eleven stormy years which brought us at last to that necessary outcome of his theories which he saw plainly enough, but refused to believe inevitable.

The most important lesson to be drawn from the life of this great man is the danger in following pure logic as a guide in statesmanship. History is not made by logic, but by compromise; and although, as Dr. von Holst remarks, "compromise between antagonistic principles is *ab initio* an impossibility," yet without compromise no government can be conducted. Now, Calhoun's life was spent in bringing the nation into an attitude in which no compromise was possible, because it was *principles*, and not measures of expediency, that were opposed to each other.

"The founders of the republic had been under the necessity of admitting slavery into the Constitution, and the inevitable consequence was that conclusions which were diametrically opposed to each other could be logically deduced from it by starting the argument first from the fact that slavery was an acknowledged and protected institution, which, so far as the States were concerned, was out of the pale of the Federal jurisdiction; and then from the no less incontestable fact that the determining principle of the Constitution was liberty, and that the spirit and the whole life of the American people fully accorded with the Constitution in this respect" (p. 127).

This remark goes to the bottom of this tremendous conflict. The antagonism between the letter and the spirit of the Constitution was one which a really wise statesman, not governed by a pitiless logic, would have avoided by suffering the requirements of the letter to be tacitly dropped out of sight. There is no question that, on the question of fugitive slaves for example, the North neglected its constitutional duty; and no more question that this constitutional duty was one which a free community could never be forced to perform. Probably nothing but war could ever have determined a contest so vital and of such magnitude; but its vitality and magnitude were largely the work of Calhoun. "The speculations of the keenest political logician the United States ever had, ended in the greatest logical monstrosity imaginable, because his reasoning started from a *contradictio in adjecto*" (p. 351).

It is interesting to observe (p. 200) Calhoun's relation to the reform in the civil service, which, even forty-five years ago, was becoming an important question. The bill which proposed to dismiss from the service officers who sought to influence elections was opposed by him as unconstitutional, and for the further reason that the abuse would be transferred from the office-*holders* to "the no less formidable corps of the office-*seekers*." The remedy proposed by him was to "place the office-holders, with their yearly salaries, beyond the reach of the executive power"; to which Dr. von Holst remarks: "If he had changed but one word—if he had said *party in power* instead of *executive power*—this advice would, indeed, have been the egg of Columbus."

In one point we cannot quite understand Dr. von Holst's interpretation of the Constitution. In speaking (p. 190) of Calhoun's resolutions of December 27, 1837, in which it is declared that "every State '*entered* into the Union' by its own voluntary act," he remarks: "The old Union, under the Articles of Confederation, therefore, evidently had ceased to exist some time before; when and how, Calhoun unfortunately forgot to say." But this does not follow. There is no question that the States had entered this old Union by their own voluntary acts, and Calhoun's argument does not require this Union to have been dissolved previous to the formation of the new one; but, the sovereignty of each State being explicitly reserved under the Articles of Confederation, he argues that it was not surrendered under the Constitution.

The Army of the Cumberland. By Gen. H. M. Cist. Charles Scribner's Sons. 1882.

THIS work, so far as we can follow it, seems to be a conscientious and truthful narrative of the operations of the Army of the Cumberland from the date of its organization to the end of the Chattanooga campaign, but it does not deal with the battle of Shiloh, in which that army took such an important part. The plan of the series of histories to which it belongs very properly assigned that battle to the history of another campaign; for, while the events connected with it were of great interest and importance, the movement which led to it was divergent from the line of operations marked out for the Army of the Cumberland. The narrative before us gives a minute account of the various minor incidents, scouts, and skirmishes in Kentucky and Tennessee, as well as of the operations of greater importance; but owing to the poor maps and plans (reduced from Van Horne's exhaustive work) which accompany the text, it is almost impossible for the reader to get a proper idea of the theatre of war, or the significance of the marches and combinations under consideration. Certainly no one but an officer of intelligence who had served in that army could follow its movements as described, or get at any satisfactory understanding of their object.

The volume now under consideration is, however, subject to another, and even graver, objection than the one just pointed out. Failing in value to the student of military history, we should naturally expect it to possess such other qualities as would commend it to the approval of the general public; but such is not the case. It is neither brilliant in style, nor graphic in its descriptions of marches and battles. The personal qualities of the generals arrayed against each other are quite neglected. The names of Charles G. Harker and William Graham Jones, graduates of West Point, and officers of extraordinary brilliancy and promise, are hardly mentioned. Gordon Granger, whose timely arrival on the battle-field of Chickamauga (whither he had marched to the sound of the enemy's guns) brought Thomas that support which enabled him to hold his position to the close of that disastrous day, was a swaggering but bold, competent, and successful soldier, whose picturesqueness at least might have been turned to account. It is perhaps unknown to many that Sheridan, who afterward reached such high rank as commander of cavalry in the Army of the Potomac, commanded a division of infantry in the Army of the Cumberland, and had his fair share of misfortune and disaster. Through it all he showed the qualities which afterward raised him to the rank of Lieutenant-General; yet, if the reader depended upon these pages for his information, he could not even tell whether Sheridan was a regular or volunteer, a graduate of the Military Academy, or promoted from the ranks of the army. Thomas J. Wood, a rugged veteran of excellent qualities, and varied fortunes, always at his post, sometimes successful and sometimes unsuccessful, but at all times and under all circumstances a brave, constant, and accomplished division and corps commander, likewise fails of recognition in these pages. It is true, he is censured for withdrawing from his place in line of battle at Chickamauga, in obedience to an order which it is contended that he misconstrued to the great peril of the army, but nothing is said of the long and faithful services by which he afterward atoned for his mistake, if mistake it was. Examples like these might readily be multiplied. Brief touches, a descriptive phrase like the "leading motives" with which Carlyle introduces the sea-green incorruptible or the rebellious needleman, a well-placed adjective, are all that we have a right to exact in narratives so condensed as these of the Scribner series. But even these are wanting in the uninspired performance before us.

ELIANE.

A Novel. From the French of Mme. AUGUSTUS CRAVEN.

"'Eliane' is interesting, not only because it is such a record of the best kind of French life and manners as could only have been written by a person thoroughly at home in the subject, but also because of the delicate drawing of character which it contains. The book is quiet in tone, and may fail to please readers who care for nothing but incident; but there are, it may be hoped, still many readers to whom its grace and fine style will recommend it."—*London Saturday Review, June* 3, 1882.

1 vol., paper, 50 cents; cloth, 90 cents.

The Nation.

NEW YORK, THURSDAY, AUGUST 3, 1882.

The Week.

THE President in vetoing the River and Harbor Bill has performed an act which will gain him a good deal of applause, and save to the Republican party a great many votes this fall. His principal objection to the bill is that it contains appropriations "not for the com mon defence or general welfare, and which do not promote commerce among the States," but, on the contrary, are "entirely for the benefit of the particular localities in which it is proposed to make the improvements," and are consequently "beyond the powers given by the Constitution to Congress and the President." He recommends that "one-half of the aggregate amount provided for in the bill be appropriated for expenditure during the fiscal year, and that the sum so appropriated be expended only for such objects named in the bill as the Secretary of War, under the direction of the President, shall determine; provided, that in no case shall the expenditure for any one purpose exceed the sum now designated by the bill for that purpose." This is exactly what was done in the river and harbor appropriation of the year 1870, and would, of course, leave the actual expenditure entirely in the discretion of the President and the Secretary of War—a result which would kill most of the jobs in the bill, and thus disgust the very men who have been most active in engineering it through Congress. The political effect of the veto will be very wholesome. The most satisfactory thing about it is that for two years it will probably stop such scandalous jobbery as the River and Harbor Bill has come to involve. The log-rollers in Congress have received a plain notification from the White House that they must count on its disapproval of this sort of legislation when it reaches the proportions of a "steal." While the present Administration remains in power they will be obliged to exercise some forethought as to what sort of internal improvements the President will probably sanction, and to refrain from piling up appropriations, under the idea that they will thereby create a pressure which he cannot resist. This is a decided gain to the public, and the President deserves all the gratitude he is likely to get for the firmness he has shown.

The more the Attorney-General's opinion on the construction of the anti-assessment statute is examined, the more open does it appear to be to very serious criticism. The *Herald* points out that Congress in a very important statute has treated the word "officer" as embracing both Senators and Representatives. The second article of the Constitution empowers Congress to declare what "officer" shall act as President in case of a vacancy. The act of Congress now in force designates the President of the Senate or the Speaker of the House as the "officer" to take his place. Now, if the word as used in the Constitution —and this is what Mr. Brewster says—includes only executive officers, then the act of Congress is in excess of the powers conferred by the Constitution, and unconstitutional. No one has ever suggested anything of the sort before, and what it really shows is that the point decided by Mr. Brewster is a very doubful one, and should have been left by him to the courts to settle. By his opinion he virtually directs the district-attorneys not to prosecute, and he does this by declaring a construction to be perfectly plain when it is obviously doubtful.

The recent letter of Secretary Folger informing the poor clerks and employees of the Government that they might contribute just as freely as they liked to Mr. Hubbell and his blackmailing committee, now turns out, according to the result of researches set on foot by the *Times*, to have been a "put-up job." The letter was addressed to "A. Thomas, chief of a division, Second Comptroller's Office, Treasury Department," and, according to the *Times*, there is no such person in existence. The beauty of the discovery lies in the fact that this "A. Thomas" was addressed by Mr. Folger as one of a class of employees longing to contribute and restrained only by fear of the law. That such shifts as this should be resorted to by the Administration shows how little it understands the general feeling with regard to assessments. The only effect of its ingenious excuses for conniving at the practice is to deepen the disgust of the public, and to fasten upon itself a large share of the responsibility for an abuse which it pretends to discountenance.

The House Foreign-Relations Committee has drawn up its report on the Chili-Peru scandal. It says that as to the missing documents, "their loss suggests the propriety of greater caution on the part of those having such papers in charge," and moreover they have, with one exception, been replaced by correct copies. As to Mr. Morton's contract, "the Committee are clearly of the opinion that Mr. Morton has done nothing, and at no time had he the remotest intention of doing anything, which could compromise the honorable discharge of his official duties"; but at the same time "the scrupulousness manifested in his interview with Mr. Randall would have been sustained beyond possible contingency by his prohibition to his firm to have anything to do with this contract upon his first knowledge of the negotiations in regard thereto"—which, whether as a criticism or as an exoneration, is equally meaningless. Of course they are as bold as lions about Shipherd, and roundly denounce his impudent attempt to corrupt our Minister to Peru, Mr. Hurlbut. With regard to Senator Blair, they say they have nothing to do with him except as a witness, but still his testimony "causes them in no way to modify the opinion already expressed, that public officials cannot guard too scrupulously against engaging in enterprises where their private interests are, or may be, brought in direct conflict with their public duties." With this, Mr. Belmont, who dissents from some of the conclusions of the Committee, has, we take it, no fault to find. The report throws absolutely no new light on any of the matters discussed in it, and will fall perfectly flat, as the death of Mr. Hurlbut, and the removal of Mr. Blaine from the State Department, took from the inquiry much of the practical interest which it originally had.

It is not too much to say that the testimony of Mr. John A. Walsh in the Star-route cases, more than that of any other witness, has encouraged a public hope for the conviction of the defendants. Evidence before taken was technically important, but Mr. Walsh's brought the crime home to a member of the ring by his own confession. So strong an impression has been made by it that there will be a very general agreement with the Washington *Sunday Herald* in the opinion that some explanation is called for from the Grand Jury of the District of Columbia in regard to its singular indifference to this testimony. As the *Herald* says, "according to Walsh's account, which is corroborated by documentary evidence and attendant circumstances, the Second Assistant Postmaster-General, having coolly attempted to treat a bona-fide loan of $36,000 as a bribe accepted by him in his official capacity, Walsh, whose sole anxiety, as he claims, was to get his money back and escape from all entanglement with the ring, was compelled to bring suit publicly in the courts." This testimony has been admitted as competent evidence in the case now on trial. Its effect is so important that the defendants' counsel made a determined effort to break the witness down; yet the Grand Jury dismissed the same testimony when given before it as of no value. Certainly that body, "far from vindicating anybody else," should make some effort "to vindicate itself" if possible.

The discussion in the Star-route trials between Judge and counsel over the propriety of punishing some of the Washington newspapers for their attacks on witnesses would have been more fruitful if the powers of the Court to punish for contempt had been made plain. The Star-route organs have been, ever since the trials began, engaged in pouring out a steady stream of abuse upon everybody connected with the prosecution, and lately they have begun to attempt to deter witnesses from coming forward by the foulest vituperation of those who have testified in favor of the Government. Walsh, for instance, whose testimony has been most damaging to the defendants, has been accused of perjury, and the late Postmaster-General disposed of as "lying Tom James." Such publications are, as Mr. Merrick said, obviously intended to frighten other witnesses from giving testimony, and place the Government at a great disadvantage in obtaining witnesses, as men at all sensitive to their reputation must shrink from exposing themselves to such vile abuse. He therefore asked leave to file a motion, to be called up at some future time, against a number of newspaper men connected with the *Critic* and *Capital*, to show cause why they should not be

punished for contempt. Judge Wylie granted the motion, but at the same time suggested that the "Act of 1831" might make it impossible to do anything. This Act is, we suppose, the United States Statute of March 2, 1831 (U. S. R. S., sec. 725), restricting the power of courts to punish for contempt to cases of "the misbehavior of any person in their presence, or so near thereto as to obstruct the administration of justice, the misbehavior of any of the officers of said courts in their official transactions, and the disobedience or resistance by any such officer, or by any party, juror, witness, or other person to any lawful writ, process, order, rule, decree, or command of the said courts." As this statute relates solely to the courts of the United States, and the Star-route trials are being conducted by the Supreme Court of the District of Columbia, it is hard to see why its provisions should have any bearing upon the case at all. If the District courts have the common-law power to punish for contempt, Judge Wylie can undoubtedly make the editors and managers of the Star-route organs in Washington suffer, and probably keep them quiet; but if not, the discussion of the matter will reveal the same sort of judicial impotence which rendered the Court's attempts to preserve order during the Guiteau trial so ineffectual.

After granting Mr. Merrick's motion, Mr. Totten, one of the defendants' counsel, in order to offset its effect, called attention to the wicked proceedings of the New York newspapers, and the "scandalous articles and reflections upon the Court itself" appearing in them "from day to day," upon which the Court proceeded to deliver a very funny lecture on the newspapers. It declared that "honest and upright men had ceased to pay any attention to them," and that so far from having any influence upon the Court, "they would be treated with the utmost contempt." As to the New York "dailies," he said, "it would not do to set off one crime against another," but that the New York papers as well as the Washington papers "would be liable to punishment if the charges were true." On the whole, he said, "it seemed impossible to have a fair trial in this country any way, because of the newspapers." Now, it is usual for courts of justice which undertake to discipline offenders to confine themselves to their own jurisdiction, and the jurisdiction of Judge Wylie does not extend beyond the District. Moreover, the idea which he seems to entertain, that general discussion and criticism of state trials in which the public has an important stake—and this is the sort of discussion of the Star-route cases that has been going on, not only in the New York "dailies" but in the wicked newspapers all over the country—is illegal, or, as he says, renders fair trials impossible, is a very singular notion for a lawyer to hold. The policy of the law in this country has been for years to encourage such discussion, as the general condition of the law with regard to contempt clearly shows. In this State, for instance, the Revised Statutes limit the power very much as the United States Statutes do—that is, to actual interference with or resistance to the administration of justice in court. The power to punish for "constructive" contempts has fallen into disuse or been abolished all over the country, and the only attempt made to revive it in this State was at the instance of the Tweed Ring, when they began to find the criticisms of the newspapers made their position and power insecure.

The Liberal combination in North Carolina is more likely to command sympathy among the Republicans of the Union than the Mahone movement in Virginia. People who are very anxious that there shall be "equal rights," a "free ballot," and a "fair count," and to that end would regard with complacency the breaking up of the Bourbon party, are very unwilling, even for that purpose, to seem to countenance schemes of repudiation. In respect of North Carolina, however, Republican sympathy is not exposed to such a trial. While there is in that State full play for opposition to Bourbon methods, the movement is not handicapped by any objectionable principle or practice. So far as the party platform is concerned, the canvass turns chiefly on the question whether county and township officers shall be elected by the people, but there will enter into it the more general question whether the whole policy of the State shall be controlled by the new and vigorous spirit of the time, or shall be founded on the study of political antiquities. The Liberal party has declared against the prohibition measure, and the declaration certainly will not weaken the party among the Democrats. Many of these, including influential men, have already united with it, eight Democratic newspapers are supporting it, and there is before it a fair prospect of success. The Democratic majority, under the old party lines, was reduced from 17,308 in 1876 to 8,326 in 1880. If, with a vigorous organization offering hospitality to independent Democrats as well as Republicans, this majority should be effaced, the downfall of Bourbonism would be unaccompanied with the prevalence of any bad doctrine such as repudiation.

The Hon. Luke Poland has accepted the Republican nomination for the Second Vermont District, in a speech in which he declares that he shall devote himself, if elected, to seeing that "the raising of funds to carry on the Government" is properly attended to, and to carrying "the results of the war to their ultimate ends and ultimate conclusions, until real freedom, the real right to the ballot, and the real right to participate as citizens in the Government shall be given to every man, black or white." He assured his audience that he knew all about "the severe nature of the duties which devolve upon the position of a Congressman," and the loud and continued applause with which his remarks were received showed that his audience took the same view of them that he does. Mr. Poland is an old man, and in the course of his speech took pains to guard against the suspicion that he might be "partially demented," but we see no evidence of dementia in his remarks. His speech is a model candidate's speech; it commits him to nothing, and shows him to be in the full possession of his mature powers as a politician.

Judge Haight's refusal to issue a writ of mandamus to compel the railroads to receive and carry freight is placed upon grounds which, to say the least, are not clearly stated. The chief reason he assigns for his decision is a distinction between the duties of a railroad, which the State imposes by giving a charter, and its duties as a common carrier. The courts have held that the writ of mandamus will issue to compel a railroad corporation to operate the whole road as one continuous line; to compel the running of passenger trains to the terminus of the road; to compel a corporation to deliver grain at an elevator standing upon the line of the road, consigned to it in bulk; to compel it to run daily trains; to compel the replacement of a track taken up in violation of its charter; to compel it to construct its road across streams so as not to interfere with navigation; to compel it to build a bridge. But the right to become a common carrier, says Judge Haight, "does not pertain to or emanate from the Government," for "every citizen, without grant or license, has the right to carry persons or property from point to point within the State upon such terms or for such compensation as shall be agreed upon."

This is perfectly true, but it is hard to see what bearing it has on the case. Every citizen may become a common carrier if he likes, but he cannot get a charter to operate a railroad except from the State; and this is the only reason he goes to the State for one. His relation to the public, however, is precisely the same, whether he acts under corporate powers obtained from the Legislature or sets up as a common carrier on his own account. In either case the duty he undertakes to perform is a public one. The difference between the two cases is that if he has no charter, the State cannot interfere with him. As a matter of fact, of course, it is usually incorporated companies which act as common carriers, but the case of a private person undertaking to transact such a business, as for instance a stage line, is not by any means unknown. In such a case, if the proprietor were suddenly to stop business, it is very true that no one would think of applying for a mandamus; but the reason of this is that the State has never conferred any authority upon him at all. A railroad exists only by permission of the State, and derives all its powers from the Legislature. If the business of a common carrier is so private that the courts have no power to compel any corporation which assumes it to receive and carry freight, how is it that they have power to compel a railroad to operate a continuous line, or run passenger trains to the terminus, or to run daily trains? This is all part of the general business of carrying, and if mandamus applies in one case, why should it not apply in all?

The movement of Mr. James E. Kelly, who is described as "the veteran bookmaker," to have Mr. Francis T. Walton, well known as "the plunger," ruled off the grounds and premises controlled by the Racing Association of America has many points of analogy with that taken by the enemies of Mr. Hutchinson, who was recently expelled from mem-

bership of the Stock Exchange. Both were accused of violating the rules of the game. Both belonged to associations not incorporated by the Legislature—associations of a voluntary sort entirely, membership of which was nevertheless valuable in dollars and cents, and therefore held by good lawyers to be under the protection of the courts. The analogy goes somewhat further, for whereas Mr. Hutchinson considers the loss of his seat (valued at $30,000) a trifle compared with the injury done to his reputation, so Mr. Kelly has presented to Mr. Walton a vivid but ineffectual picture of the disgrace he must suffer if he should be ruled off the race-tracks of the country—ineffectual because Mr. Walton appears to be wholly insensible to the degradation. "Men who were ruled off," said Mr. Kelly with deep solemnity, "always went to the dogs; they were shunned by all their old associates, and cases were known where the wife and children of such a man had refused to recognize him." Mr. Kelly added that he had no personal feeling in the case, but he deemed it a duty for somebody to expose Mr. Walton's practices as a corrupter of jockeys, and he felt that he could afford to undertake the task. The reply of Mr. Walton to this friendly admonition, as recorded by Mr. Kelly, "that he (Walton) proposed to make money," shows how far the hardening process has gone since Mr. Walton returned from the other side of the water, laden with the spoils of the English turf. When the prospect of going to the dogs and being spurned by wife and children is received with a laugh, there is no lower deep for a "plunger" to plunge into.

A circus clown has been telling a St. Louis newspaper that the best days of the circus are over. One of the reasons he gives for thinking so is that, for success in the circus, training must begin early in life, and the societies for the prevention of cruelty to children are so active that they prevent anything of the kind. There may be something in this; but a more serious difficulty, we fancy, is that the part taken in the performance by the clown is much less attractive than it formerly was, owing to the fact that a great deal of the talent which once found its way into this business now goes into journalism, the mental outfit of a really able "funny man" being very much what that of a successful clown used to be. The press makes a business of supplying daily just such jokes as the circus used to provide, and ambitious humorists, who would formerly have worn stripes and spangles in the ring, now entertain the public through a newspaper. The clown proper has consequently run down, because the profession no longer attracts the best humor, as any one may satisfy himself by going and listening to a modern clown trying to make jokes. There is obviously no remedy for this decay, which really gives a new illustration of the wonderful power of the press.

In Wall Street the week has been active, but the changes in prices were not so important as during the week before. The crop news continues to be excellent, the estimates of the wheat crop running up to 600,000,000 bushels, and the latest indications being that the corn crop will not fall far short of an average yield. All this promises an extraordinary tonnage for the railroads, and lays a foundation for good business for all classes of merchants. There were one or two downward reactions in the stock market, but the investing and speculating public were so confident of higher prices that they continued buyers of stocks, and the demand from them sustained the market. United States bonds were strong for the long issues and lower for the short-date issues, which are to be funded into three per cent. bonds, the applications for the latter having begun on the first day of August. The foreign demand for American securities has been moderate. The banks again reduced their surplus reserve, leaving it at $5,381,025, but this had little influence, as, on Tuesday, the 1st inst., the Treasury began the disbursement of $15,000,000 of cash for called bonds, and $3,500,000 for interest. Exchange on London and the Continent tended downward during the week, and in well-informed quarters the opinion was expressed that, later in the year, gold would be imported. General trade for the autumn is opening well at all the wholesale centres of distribution.

The great event of the week in foreign affairs has been the end of the Anglo-French alliance and, almost simultaneously, of the Conference. The decisive overthrow of the Freycinet Ministry, on the question of a special credit for the defence of the Suez Canal, is a complete abandonment of the common action which the *status quo* in Egypt created by the Financial Control logically called for. The retirement of Russia from the Conference, on the ground that its proper business is exclusively the maintenance of the Canal, gives the finishing stroke to an absurd body which has only served to paralyze England's military operations on the Nile. We shall now hear no more of the "European mandate," nor of volunteer agents to carry it out. The only "Europe" which has any mandates to give is the quadruple concert (so formidable in the eyes of France) of Germany, Austria, Italy, and Russia. This Europe is friendly to the preservation of the Canal, and will not object to England's insuring it at her own expense. It is doubtful if the four Powers have any real desire to see the Porte intervene in the Egyptian mêlée, either as plenary suzerain, or with "mandatory" sanctions and restrictions. Their long endurance of the Financial Control makes it improbable that the inevitable decision on England's part to play the game alone, and reject Turkish assistance after having sought it, will incur their opposition or even censure. Russia, certainly, is very glad to resume her old rôle of the Sultan's best friend and adviser; and the prospect of Indian troops once more sailing up the Red Sea cannot but remind her of Beaconsfield's preposterous but irritating demonstration, and encourage her to offer what passive obstruction she can to England's aggrandizing adventure. On the other hand, France's abstention, for obvious reasons, must give secret satisfaction to Germany and Italy. For the present, the upshot of the matter is that no Continental power will lend a man for the pacification of Egypt or to guard the Canal, and that Arabi has to account with England alone.

The debates on the earlier vote of credit in the French House were a curious revelation of the state of feeling in that country. Minister Freycinet was blamed for his vacillation between a cordial understanding with England and an anxiety to secure the approval of Europe; for his running counter to French history and traditions in consenting to the Turk's return to Egypt; for having forfeited France's equal share in the direction of Egypt, by holding aloof from the bombardment of Alexandria; and for begging employment as the agent of "Europe," when that term simply meant Bismarck. M. Lockroy bitterly compared the situation to that in 1840, when Thiers was ready to fight all the Powers in support of Egyptian independence of the Porte. Gambetta ardently sustained the vote of credit, but complained that it was too small; praised Freycinet for his desire to cherish the alliance with England, which had been the object of his own famous and much-decried note of January 7; and justly ridiculed the "guarantees" which the Premier had kept in reserve with regard to Turkish interference. He insisted on giving the Ministry the fullest scope for acting during the recess of the Parliament as the crisis demanded. Apparently, French "honor" and "glory" were never more in question, by the testimony of all the speakers in opposition; yet the overwhelming majority on the vote for the Canal credit signified both a want of confidence in Freycinet, and an utter want of sympathy with Gambetta's warlike policy. In fact, the vote was a second defeat for this leader, as showing that he did not hold a divided empire with the party in power. He had not behind him even M. Lockroy, who, in spite of his historical allusions to Thiers, showed no disposition to complete the parallel between 1840 and 1882 by shouting, "To the Rhine!"

England's isolation is, from a military point of view, not wholly a loss to her. She gains freedom of action as regards France and as regards the Porte, and is hampered now chiefly by the assumed necessity of proving her disinterestedness by working through the nominal authority of the Khedive. The situation which periodically grows out of the fiction that Turkey is the peer of the other European Powers gives rise to the same sort of inconsistencies and embarrassments which marked our early dealings with the States in rebellion. The great weakness for the first few years of the Federal operations was caused by Northern anxiety to maintain the Constitutional privileges of States which were actively at work destroying the Constitution. In like manner the Porte, intriguing with Arabi against Tewfik, has cunningly delayed and weakened the blows of England, by claiming his full rights as suzerain of the Khedive. This humbug cannot last much longer, even if ironclads have to be sent to Constantinople as well as Alexandria—a by no means impossible contingency, should the Porte now insist on sending troops to Egypt on any pretext.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, July 26, to TUESDAY, August 1, 1882, inclusive.]

DOMESTIC.

THE President, on Tuesday afternoon, sent to the House of Representatives a veto of the River and Harbor Bill, because "it contains appropriations not for the common defence or general welfare, and which do not promote commerce among the States"—which is an infraction of the Constitution.

Representative Flower, of New York, has introduced a Constitutional amendment, giving the President power to veto separate items of appropriation bills.

In the Senate on Wednesday, Mr. Lapham, of New York, said that the Committee on Foreign Relations had learned that large amounts of capital had been invested in the taking of fish for the manufacture of oil and fertilizers, and that the vessels engaged in this trade, it was asserted, seriously interfered with the food fisheries on the Atlantic coast. He therefore offered a resolution, which was adopted, that five members of the Committee be appointed to investigate the matter, during the recess, in conjunction with the Fish Commission.

The desultory debate on the Internal-Revenue Bill, which threatened to prolong indefinitely the session of Congress, was brought to a sudden close on Wednesday. Mr. Hale, of Maine, a Republican, moved to postpone all present and prior orders, to take up the Naval Appropriation Bill. Mr. Morrill, of Vermont, made a vigorous speech, insisting that the Revenue Bill be proceeded with. In the further progress of the debate the position of the friends of the bill was commented on as a virtual abandonment of it. When a vote was finally taken on Mr. Hale's resolution, it resulted—yeas, 34; nays, 26; six Republicans voting with the Democrats in favor of the motion. It is said that the knowledge that the Revenue Bill would meet its death in the House contributed to its virtual defeat in the Senate.

A motion to recommit the Naval Appropriation Bill, for the purpose of striking out the new legislation, was defeated in the Senate on Thursday, the vote being 29 to 34. In executive session, the Senate reconsidered the vote by which it had refused to confirm the President's nomination of Mr. Lanning, a Stalwart, as postmaster at Penn Yan, N. Y. He was then confirmed, by a vote of 25 to 20, thirteen Republicans voting against confirmation. Senator Miller, of New York, vigorously opposed the confirmation, attacking Postmaster-General Howe's course in lobbying for the confirmation.

On Friday the Senate passed bills in regard to the pay of letter-carriers, and ordering additional copies printed of the Tenth Census reports. It then engaged in a wearisome discussion of the Naval Appropriation Bill. The Deuster bill to regulate the carriage of passengers at sea was passed without objection on Saturday. It is constructed in accordance with the President's suggestions in his recent veto of a similar bill. When the Naval Appropriation Bill was taken up, Senator Beck offered an amendment, reducing from $1,000,000 to $400,000 the amount appropriated for completing the *Miantonomoh* and launching the four other monitors; prohibiting the completion of those four vessels until further orders of Congress, and directing the Naval Advisory Board to report as to the advisability of their completion. The amendment was adopted, by a vote of 27 to 22; the clause of the bill abolishing the rank of commodore was stricken out. The bill was passed as amended on Monday. The Emigrant, or "Head-Money," Bill was passed without opposition. The Sundry Civil Appropriation Bill was under discussion on Monday and Tuesday.

The House of Representatives on Wednesday was principally occupied with the consideration of conference reports. The Committee on the General Deficiency Appropriation Bill reported that it had been unable to agree with a similar Senate Committee on the question of the payment of mileage to Senators for attendance at the extra session. The House refused to recede, and a further conference was ordered. The House also insisted on its disagreement with the Senate on the provision in the Legislative, Executive, and Judicial Appropriation Bill for the transfer of the records of the Surgeon-General's office to the Adjutant-General's office. The conference report on the River and Harbor Bill was then taken up and agreed to—yeas, 111; nays, 82.

After a long discussion, the House, on Thursday, passed the bill granting a right of way through the Choctaw Indian nation Territory to the St. Louis and San Francisco Railroad Company.

On Friday the House adjourned over until Monday, without transacting any important business. This is unprecedented at this stage of the session, but it is said that the action was taken because the House was afraid to trust itself with its own business, and, further, that it wished to stir up the Senate to activity. The House on Monday referred the bill placing General Grant on the Army retired list to the Committee on Military Affairs. This disposes of it for the present session.

A report on the recent Chili-Peruvian investigation was unanimously adopted, on Tuesday, by the Foreign Affairs Committee of the House of Representatives. It exonerates all officers of the United States from being improperly connected with business transactions which aimed at the intervention of the United States Government in the affairs of Chili and Peru as a part of those financial schemes.

Erastus Clark, Postmaster of Utica, a "Half-Breed," has been removed, and J. T. Stephens, a Stalwart, nominated by President Arthur for the place. The nomination is purely political, and the hand that moved it is said to be Mr. Conkling's.

Postmaster-General Howe has issued an order for stamping all packages of bonds for exchange into three per cents with the day, hour, and minute at which they are mailed at any post-office. This is done so that priority of application can be accurately determined. The orders will be filled according to this priority.

The entire collections of internal-revenue taxes for the past fiscal year, amounting to $146,520,273 71, have been accounted for and turned into the Treasury.

It is said that the Government has expressed a willingness to arbitrate on the Mexico-Guatemala boundary question, on the joint application of those nations, after they shall have definitely determined the exact question they wish decided.

General Grant has addressed a letter to Chairman Williams, of the House Foreign Affairs Committee, urging the payment of the Japanese Indemnity.

The Star-route trials progressed rapidly in Washington during the week, the prosecution bringing their case to a close with some important evidence. On Wednesday, a discussion took place as to fixing bail for Price, who is indicted as one of the conspirators with Brady. He is now a fugitive in Canada. His counsel urged that he was under surgical treatment, and could not appear in person. Judge Wylie decided that he would have to go before a commission and give bail to appear at the proper time, and that the Court could not fix the bail in his absence. Mr. Merrick, for the prosecution, on Thursday, moved for a rule upon Mr. A. C. Buell, the editor of the Washington *Capital*, to show cause why he should not be punished for contempt of court, in publishing an article accusing Mr. Walsh of perjury, and using other abusive and libellous language. These articles, Mr. Merrick said, were intended to intimidate and frighten other witnesses, who would not care to become the objects of such abuse. He therefore wished to file motions and call them at the proper time. The Court gave permission to file the motions. Walsh was then recalled, and made some corrections in his testimony. Several bank officers from New York and Washington were examined as to the accounts of Brady, Dorsey, Miner, and other defendants. The prosecution closed its case on Friday, but the defence were not ready to proceed, and they asked for an adjournment until Monday, which was granted.

In the Star-route trials on Monday, the defence presented ex-Senator Mitchell, of Oregon, Representative Valentine, of Nebraska, and Secretary Teller as witnesses. They testified that frequently they had urged expedition upon Mr. Brady, when he was in the Postmaster-General's Department, and that they believed that such expedition of routes was warranted.

At Long Branch, the Tariff Commission has been holding daily sessions. On Wednesday, Mr. Henry F. French, Assistant Secretary of the Treasury, appeared and made a preliminary statement of the ambiguities in the existing tariff laws, and of the difficulties and litigations to which they give rise. Mr. Everett P. Wheeler, representing the New York Free-Trade Club, also addressed the Committee, urging the diminution or abolition of the duty on raw materials. Mr. Joseph Wharton, of Philadelphia, combated his arguments. The quinine manufacturers had their interests presented before the Commission on Thursday. They contended that the abolition of the duty had not been of benefit to the consumer. The flax industry sent representatives on Friday to make arguments in favor of continuing or increasing the present tariff rates on the raw material as well as on manufactured goods. The dealers in foreign periodicals made a plea on Saturday that all newspapers and unbound magazines be put on the free list. A protest was made, on Monday, against the high tariff on chemicals.

The freight-handlers, who have been on a strike for six weeks in this city and Jersey City, have been encouraged within the past few days by a number of German laborers, who had been employed in their stead, going on a strike for the rates demanded by the original malcontents. On Wednesday, a serious street row took place on the corner of Broadway and Canal Street, between some newly-employed Italians and the strikers. Several of the former were wounded. Toward the end of the week, many of the strikers returned to work, and comparative quiet was restored.

A decision was rendered on Friday, by Judge Haight, of the New York Supreme Court, in the case of the people against the New York Central and New York, Lake Erie and Western Railways, for an order to show cause why a peremptory writ of mandamus should not issue to compel the railroads to receive and transport freight as common carriers. The proceedings were begun to find a way out of the difficulties of the freight-handlers' strike, and compel the companies to receive the freight offered. Judge Haight decided that "it is not in the power of the Court to look into the future and determine the kinds or quantities of freight that will be hereafter presented for transportation, and by an order to specify how and in what manner the same shall be carried, or what kinds shall take preference." The decision asserted that the neglect to transport freight was a private wrong, for which the citizen is entitled to recover in an action at law for damages, but that it is not such a public wrong as will authorize the issuing of the writ of mandamus. The motion to quash was granted.

The Independent Republican State Committee of Pennsylvania met in Philadelphia on Thursday and rejected the four Stalwart propositions for a compromise, on the ground that they afforded no guarantee that, being accepted, the principles upon which the Independent Republicans have taken their stand would be treated with respect or put into action. This

will probably be the last of the compromise measures in Pennsylvania, unless the Stalwarts accede to the proposition of the four Independent candidates, made in their letter of July 13.

The Missouri Democratic State Convention met on Wednesday and nominated Thomas C. Sherwood for Judge of the Supreme Court, and William E. Coleman for Superintendent of Public Schools. The platform demands civil-service reform, and the reduction of all duties to a basis only necessary to secure public revenue. The temperance question is met by an assertion that the party is "in favor of the largest personal liberty consistent with the public welfare."

The Virginia Straight-Out Republican Committee decided, on Wednesday, not to call a State Convention, but themselves nominated the Rev. J. M. Dawson, an educated Baptist clergyman, for Congressman-at-large. They adopted a platform renewing allegiance to the National Republican party, and deploring the alliance of the Administration with the Virginia Readjusters.

The Delaware Republicans have nominated Albert Curry for Governor, and Washington Hastings for Congressman-at-large. The platform favors civil-service reform and a protective tariff, and expresses confidence in President Arthur's Administration.

A despatch from Utah announces that "a wholesale persecution of the Gentiles" by the Mormons has been begun, and arrangements have been made for testing the constitutionality of the Edmunds act. If the decision be adverse, the Mormons have determined not to submit. All polygamists have, under orders, resigned from all municipal offices, and monogamists who are strong believers in Mormonism have been commissioned in their places. The prominent polygamists are living openly with only one wife.

A secret organization is being formed in Arizona and New Mexico to wipe out the Apache Indians.

There is great mortality in Alaska from a plague, a combination of scarlet fever and measles. Commander Pearson, of the United States steamer *Wachusett*, is severely censured for taking both surgeons away from Sitka and leaving no medicine.

Intense heat has prevailed in this city and throughout the country for the past week. On Friday, the thermometer in New York reached 99° in the shade. The death-rate has been very great. 194 deaths were reported on Thursday, about fifty per cent. of which were due to heat; on Friday there were 184 deaths, and on Saturday 218. The total for the week was 1,217. The death-rate for the past three weeks has been higher than during any successive three weeks since 1854, the cholera year. In 1872 there was one week in which the deaths reached 1,500, but the next week there was a great falling off. The temperature declined to 87 on Saturday noon, and more moderate weather ensued.

FOREIGN.

During the week Egyptian affairs have progressed slowly. The time has been spent mostly in active preparations for further hostilities by Arabi Pasha and England; in procrastination and duplicity by the Porte; in vacillation and internal dissensions by the French Government. On Wednesday it was announced that the Porte had finally consented to send troops to restore order in Egypt, but a later interpretation of the announcement showed that the Porte merely recognized the appropriateness of the suggestion to send troops, and wanted further time for the discussion of the conditions under which they should be sent. Mr. Gladstone intimated, in a speech in the House of Commons, that the Government would not consent to the British force occupying a secondary position in case Turkey did send troops. On Thursday the Turkish delegates declared, at a sitting of the Conference in Constantinople, that Turkey was ready to despatch troops to Egypt immediately, under the conditions of the identical note, but immediately expressed the hope that England would withdraw her forces from that country. England demanded, through Lord Dufferin, a specific date for the despatch of the troops, and, before their despatch, a proclamation upholding Tewfik, the Khedive, and denouncing Arabi Pasha as a rebel. The Sultan, replying to these demands, on Saturday, said that the request for proclaiming Arabi a rebel should not be made by England alone, but should proceed from the Conference of the Powers, in which case it would receive due consideration. Mukhtar Pasha has already made arrangements which will enable the Porte to despatch 20,000 men to Egypt in successive detachments.

Active operations around Alexandria during the week were of little importance. On Thursday the news was published of an attempt to surprise the British outposts at Ramleh, which had been unsuccessfully made on Tuesday night, July 25. Under cover of the darkness, 600 Egyptians approached close to the British lines, but the Thirty-eighth regiment opened fire upon them, and they fled precipitately. On Thursday morning a great fire broke out in the native quarter of Alexandria, near Zaptieth. A large block of buildings was burned. The fire was subdued in about two hours. It was the work of Arab incendiaries. The British lines were extended a mile and a half beyond the pickets at Ramleh, on Thursday, in order to occupy a house on the banks of the Mahmudieh Canal.

A large powder magazine at Mekherrom, from which it was said Arabi had recently taken his stores, was blown up by the British on Saturday. The fort at Gabari was destroyed on the morning of the same day. Osman Pasha and twenty-six Circassian officers, who were implicated in the recent plot to assassinate Arabi, arrived on Saturday at Alexandria for Constantinople, having been summoned by the Khedive. They were received with great honor.

An unconfirmed report was spread in London on Friday that Arabi Pasha had proposed terms of peace, the conditions being voluntary exile and the retention of the rank and pay of colonel for himself and nine of his colleagues. He offered to retire to a Mussulman monastery in Syria. It was also rumored that he said he would not resist Turkish troops operating without European auxiliaries. It was announced in the House of Commons that there had been indirect communications with a view to the surrender of the military party, but there had been no direct conference with Arabi. The rumors caused Egyptian stock to rise four points. On Friday evening another rumor was spread in the House of Commons that the Sultan had made overtures to Great Britain, looking to the transfer of Egypt to England on the same terms as those on which Cyprus changed hands. On Saturday it was denied that a deputation of rebels from Kafr-el-Dwar, which arrived in Alexandria on Friday, had been the bearers of compromise proposals. The Porte also denied that it had received any announcement from Arabi of his submission.

M. de Lesseps has caused considerable trouble at Port Saïd, at the entrance of the Suez Canal. Early last week the inhabitants of the Arab villages attempted to enter the European quarter, but were repulsed by the military. The French Consul then applied to the French Admiral Conrad for protection for French subjects. He, in turn, asked the English Rear-Admiral to make a joint occupation to preserve order. M. de Lesseps appeared upon the scene and violently abused the French Consul for asking occupation; he said that this was playing into the hands of the English. The French Admiral then refused to land marines. On Thursday M. de Lesseps telegraphed to Arabi, telling him that he had sent a despatch to the French Premier, assuring him that the Canal was in no danger, and that if he would make him the representative of France at Port Saïd, he would insure the safety of European life and property and the security of the Canal. Arabi replied that he would do all in his power to protect the Canal as long as England respected its neutrality.

The House of Commons on Thursday voted the credit for the Egyptian expedition—yeas, 275, nays, 19. A supplementary vote for 10,000 men for the Army was also agreed to.

Both the French Chamber of Deputies and the Senate had voted 7,000,000 francs for naval preparations, but on Wednesday the Committee of the Chamber rejected a proposal for a second credit of 9,500,000 francs for protective measures in Egypt. The Committee also defeated a motion that M. de Freycinet should not make the matter a Cabinet question. In the Chamber of Deputies on Saturday, M. de Freycinet moved the vote of credit, and said it was a question of confidence in the Cabinet. In spite of the appeal, the credit was rejected by a vote of 450 to 75. The Ministry then tendered their resignations to President Grévy. He requested them to transact the business of their offices until the appointment of their successors. The new Ministry has not yet been announced.

M. Say, French Minister of Finance, has asserted that it will be impossible this year to convert the five per cent. rentes.

M. Onou, the Russian representative, informed the Conference, on Monday, that Russia considered the Egyptian question divided into two distinct parts, and that he was instructed only to participate when the Suez Canal question was being considered. This seemed to put an end to the Conference, but on Tuesday he was ordered to rejoin the Powers in council. Russia is said to be jealous of England's independent attitude.

The information reached England and this country last week that a man giving his name as William Westgate had been arrested at Puerto Cabello, Venezuela, who acknowledged that he was one of the murderers of Lord Frederic Cavendish and Mr. Burke. The names of three of his accomplices and other details of the murder were taken by deposition before the British Consul. Westgate confessed that he left Dublin, on the night of May 6, by steamer. He said that he was employed by influential persons to do the deed, and that each of the assassins received $100. It has been ascertained in Dublin that Westgate, or O'Brien, as he is also called, sailed from Northwall ten minutes before the tragedy occurred in Dublin, and that some of his friends were with him for an hour before the vessel sailed. The authorities are therefore confident that he is innocent.

The Arrears of Rent Bill passed its third reading in the House of Lords on Tuesday. Several amendments, moved and carried by the Conservatives, seriously affect the relief afforded the tenant by the Act. Mr. Gladstone will move in the House that they be not accepted.

Mr. Gladstone has announced in the House of Commons that the Government has abandoned the hope of passing the Corrupt Practices Bill this session.

In Ireland the weather has improved recently, and the prospect for crops is again promising. Though the potato blight has appeared in badly drained ground, there is a splendid crop in most parts of the country.

Lord Coleridge, Lord Chief-Justice of England, has accepted an invitation from the New York Bar Association to visit this city next year.

Minister Marsh's body arrived in Rome on Friday and was received with great honor. It was deposited in the mortuary chapel at the Protestant cemetery, where it will be buried in September.

A very successful first performance of Richard Wagner's new opera, "Parsifal," was given in the Bavarian city of Baireuth on Wednesday.

THE WORK OF CONGRESS.

AFTER an eight months' session, Congress is preparing to go home, and, indeed, it may be regarded as having already adjourned, for there are so few Congressmen left in Washington that the transaction of any new business is impossible. The "record" of the session is a shocking one. In general legislation, although there were many subjects which urgently called for it, little has been done. The Bankruptcy Bill, demanded by the leading commercial bodies of the country, and the bills for the relief of the Supreme Court—the failure to consider which, in the present condition of the docket of the court, amounts to a substantial denial of justice—have been hustled out of the way, in spite of protests from all quarters. The tariff has been disposed of in what must be considered a ludicrous manner, by being handed over to a commission of "experts," these being merely representatives of the various interests and industries which usually get tariffs through Congress by influence and combinations, and which is really only a selected lobby. Of general legislation there has, with the exception of the Bank Charter Extension Act, been almost none, and that act Congress was compelled to pass, because, otherwise, the entire business of the country would have received a violent shock.

But Congress has not been idle ; on the contrary, it has been very busy. It has done more business than any legislative body in the United States for many years. The expenditures for the fiscal year ending with June, 1883, excluding principal and interest of the public debt, are fixed at $294,513,639. The increase over last year's outlay is a little less than $78,000,000, and over that of the year before more than $100,000,000.

The River and Harbor Bill has grown from something more than $11,000,000 to $18,743,875—an increase of more than $7,000,000. The sum called for to make good deficiencies is nearly $24,000,000 more than was needed last year, of which $16,000,000 is for pensions. We believe the only appropriation cut down this year is that for fortifications. The Naval Bill, as it came from the House of Representatives, showed an increase upon last year of nearly eight hundred thousand dollars. Before it passed the Senate, the amount authorized to be expended upon unfinished and probably worthless monitors was cut down from one million to four hundred thousand dollars. But the Naval Bill, even as the Senate has amended it, appropriates more money than was spent last year. Other of the regular appropriation bills show an increase in the following fashion over those of last year :

Army	$570,200
Legislative, Executive, and Judicial	2,076,312
Sundry Civil	2,062,992
Indians	629,134
Military Academy	11,565
Post-office	3,686,468
Consular and Diplomatic	65,220

Not only has the main work of the session been the increase of the appropriations, but it has been done in a peculiarly barefaced way, and with a sort of defiance of public opinion that is more like what used to go on at Albany during the Ring period in this city than anything that has been hitherto seen at Washington. The River and Harbor Bill is on its face such a huge job that no public defence of it has been attempted, and the Naval Bill was put in charge of a man notorious all over the country for his maladministration of the Navy Department. As if to emphasize this outrage upon the public, Mr. Robeson was allowed by the majority not merely to manage the legislation, but actually to appear as leader of the House. The appeal to the President to veto the River and Harbor Bill came from the public, and, as every one knows, has been secretly but earnestly resisted by all the members of Congress who are interested in the appropriations it makes —that is, a great majority of them. In fact, when the veto came, the House at once passed the bill again by a more than two-thirds vote.

Although the showing this year, however, is worse than usual, it is so only in degree. It attracts more attention because the figures are more startling, not because any one believes that the members of the present Congress are made of different material from their predecessors. It is obvious, too, that while they remain of the same material—that is, while they are in so large measure obscure men, who look upon politics just as the average man looks on any branch of trade which he may take up, who are seldom removed by the possession of any considerable wealth from the reach of pecuniary temptation, and who are of course entirely callous on the subject of less gross sorts of corruption—this sort of thing must continue, unless it is checked in some way. Our legislation will be in the same class of hands for many a long year. A good deal might undoubtedly be done by a Constitutional amendment giving the President the right to veto separate items in the appropriation bills. This experiment has been tried in New York with complete success. The responsibility which the power places in the hands of the Executive, and the corresponding public watchfulness of his exercise of it, force him to devote to the appropriations a minute attention, and to examine into their fairness and expediency. The result is that a large number of bad jobs are annually killed, and the reasons for their being killed made public. What has happened at Albany would undoubtedly happen at Washington if the President had this power, and it is hard to believe that even with our very cumbrous machinery for adopting Constitutional amendments the change would not be effected in time by any resolute member of Congress who should devote himself to it. Until it is introduced, such measures as the River and Harbor job and the Buildings appropriation, to say the least, will be perpetuated. Members of Congress are not left at home by their constituents for voting for these, because in each district the appropriations create a corrupt influence at the back of the member; the unpopularity among his constituents caused by his helping them out of the national treasury is never likely to be very great.

To any one who considers the conditions which have led to the present state of affairs, the annual exhortations addressed to Congressmen to reform and devote more time to general legislation and less to contriving dodges for having money spent in their districts, seem very idle. This is, as any one can see by looking at half-a-dozen speeches of candidates for Congress, the very thing they go to Washington for. The only thing that can be done to reform them is to give them some reason for devoting their attention to better things. Now, the reason that they find it for their interest to behave as they do is, that experience has shown them that in securing nominations what they need is not the support of the thinking people of the district, but that of the "boys"; and the way to get that is to have as much money spent in the district as possible. Why Jake and Barney and Mike prefer to have a man sent to Congress who knows how to get through appropriations, and look with suspicion on the "gentlemen" and "reformers" in politics who talk about the necessity of attending to general legislation, and making taxation lighter, and revising the tariff, is too obvious to need explanation. The view of the proper sort of man to send to Washington now held by Jake, Barney, and Mike will undoubtedly continue as long as the "boys" control the nominations and tell the quiet thinking people whom they have got to vote for. In other words, the "Machine" must be broken up before much improvement in legislation is likely to be seen at Washington. The "boys" must disappear from the control of politics. This is, of course, impossible as long as patronage remains in its present condition.

A NEW FIELD FOR LITIGATION.

THE English courts will soon have to pass upon the right of a city to maintain an action against a newspaper for publishing articles tending to bring it into hatred, ridicule, and contempt. The London *Lancet* has been publishing some articles on the drainage and sewerage of Brighton, which, in the opinion of the officers of the corporation, have done the place a material injury, and deter people from coming there, and depreciate the value of property. Brighton is what we should call in this country a "resort," and is a place the prosperity of which is based, to a great extent, on its reputation for being healthy. Its population lives on money drawn from people who go there in pursuit of health; and if a belief is produced that the drainage and sewerage are in such a condition as is likely to produce disease, they will go to other places. It is natural, therefore, that the Brighton authorities should resent "disquieting rumors" having a tendency to produce such disastrous results.

The case, apart from the merits, however, presents a question of law of a novel character. No court, we believe, has ever held that a city could maintain an action of libel, and the difficulties in the way of maintaining the right are obviously considerable. A private trading corporation which is libelled can obtain redress in the courts just as an individual does. All it has to show is that it has been defamed in its corporate capacity. If some wicked or reckless newspaper were to say, for instance, that the Manhattan Railway in this city was a financial wreck, the company's solicitors would no doubt successfully prosecute an action of libel and recover substantial damages, because it is a matter of public record that the company, though it had an attack of insolvency for a short period, has

completely recovered and is as solvent as possible. The libel in such a case would distinctly affect the reputation of the company. That of Jay Gould, with whom it is sometimes confounded, would not be touched, because insolvency on the part of the company could not at all impair the financial strength of Gould.

But with a city the case is obviously different. A city is a corporation which does not carry on any business, but exists for political and municipal purposes solely. These purposes vary greatly according to circumstances. In London and Paris they are mainly the protection of life and property, the maintenance of order, and the laying out, mending, paving, and lighting of the streets. In New York and other American cities, there is generally believed to be, in addition to these objects, the support out of the taxes of a number of bosses, workers, heelers, and other politicians, and the various halls in which they arrange the "deals" by which our municipal system is carried on. Still, all this comes under the head of politics, and though we often hear politics spoken of as a trade, in city governments the trading is done by the politicians among themselves, and not by the corporation.

The first difficulty, therefore, about libelling or defaming a city would be that it has, properly speaking, no business interests which can be affected by the libel. If its character is blackened and its reputation damaged, it is not, like a business corporation, in receipt of any profits which can be diminished by a loss of business. If people are deterred from going to it in pursuit of health, or pleasure, or any other object, the prosperity of the place will, of course, be diminished; the hotel-keepers and the storekeepers will suffer; rents will fall; grass, even, may grow in the streets; but this suffering will fall rather upon the owners of property in it than upon the corporation. If the Mayor and Aldermen were to recover damages, all they could do with the money would be to put it in the city treasury, where it would reduce the general tax-rate; but this would be inadequate redress.

If the right to bring libel suits were conceded to cities, it is obvious that a new and very wide field for enterprise in litigation would be opened. In this country, owing to the peculiar condition of our municipalities, hardly a day passes without some remark about one or other thriving city appearing in print, well calculated to bring it into hatred, ridicule, and contempt. The inefficiency and corruption with which the affairs of our great cities are carried on are among the staple subjects of discussion in the press. To say that New York is the most corruptly governed city in the world, that its sewerage and drainage system is good for nothing, that its police or detectives are in league with the thieves, that its streets are ill-paved and half-lighted, and most of its parks are going to ruin, is so perfectly trite that a journalist who could find nothing severer to say would be considered a very incapable writer. Such statements must be libellous if they are not true, and the establishment of their truth in court would be no easy matter. The Mayor and Aldermen of New York live in an atmosphere of libel. The treatment of them in the press is such as must frequently arouse their severest wrath; hitherto they have not had any means of redress when the "deals" by which the corporate affairs are believed to be managed have been denounced in the press. They all, in fact, invariably deny that there are any deals, so that there would here be a fine opportunity for maintaining a libel suit.

But the remedy could not be confined to cities. If a municipal corporation can maintain a suit, so can a county, a State, the United States, or any sovereign power. These are all political corporations, and it would be impossible to make any distinction between them. The Southern States, for instance, would have a capital means of vindicating their reputation for honesty in the courts. They are always being accused in the press of "repudiation," or, in other words, robbing their creditors. They deny in toto that they ever repudiate, but insist that what they do is to "scale," "readjust," or "fund" their obligations. The true way to test this question, and have it finally disposed of, would be by judicial machinery. If the Southerners are right, they have been grossly libelled, and a great pecuniary wrong has been done them, too; for every one knows that the borrowing power of many of the States has been seriously impaired, if not by barefaced swindling of their creditors, then certainly by the libellous articles which their creditors get published about their method of managing their debts.

But sovereign governments are having disagreeable things said about them quite as often as cities or States. A generation ago the atmosphere of international criticism between this country and England was one of perpetual libel. What were Dickens's 'American Notes' and 'Martin Chuzzlewit' but elaborate libels on the United States? A caricature is a libel just as much as any other. On the other hand, what were the replies of our press but libels? The late Artemus Ward used to libel the Queen and John Bull and the British nation—and in the eye of the law they are all the same—with extreme freedom and success. The war of 1812 was preceded and hastened by multitudinous libels. The Rebellion was accompanied by descriptions of each section in the press of the other well calculated to show that the end was not far off for either. The London *Times* never speaks of this country without either libelling it, or else indulging in adulation of it, and one cannot be offset against the other in a libel suit. Mr. "Richelieu" Robinson never alludes to England without defaming and insulting the British lion in the most shocking way. Such aspersions upon national character must have far more widespread effect than a libel on the Mayor and corporation of a little place like Brighton. Of course, a sovereign government could only maintain a suit in the courts of the nation where the libel was committed, by comity, but the right once recognized, this would have to be conceded. It is obvious that if the Brighton suit is successful, the future of libel suits will become very interesting all over the world. There is probably not a nation in the world that has not outstanding claims growing out of libels, sufficient, if recognized, to wipe out its national debt.

NEW ENGLAND FORESTS.

THIRTY years ago the pine forests of Maine were considered inexhaustible, and Bangor was the greatest pine-distributing centre on the continent. Spruce, which then abounded in all the Northeastern forests, was little esteemed and rarely cut, and hemlock not at all, except for its bark.

We are reminded of these facts by the publication by the Census Office of Forestry Bulletin No. 15, which deals with the pine and spruce forests of Maine. The map which accompanies this Bulletin shows that nearly one-half of the entire area formerly covered with coniferous forests has been stripped of its merchantable timber, and that the large pine, and nearly all the largest and best spruce, has been culled from the remainder. There are still, however, some considerable bodies of large, scattered pine, principally in the extreme southwestern part of the State, which, strongly held as investments, have thus far escaped destruction. Second-growth pine, too, is springing up wherever in the State the forest is spreading again over abandoned farming lands; and the oldest of the second-growth pine, although far from mature, already furnishes the mills with saw-logs, and actually supplied a large portion of the hundred and odd million feet of pine cut in the State during the Census year.

Great changes have occurred in the lumbering industry in Maine during the last twenty years. Now five-sixths of all the lumber manufactured in the State is spruce, the supremacy of Bangor as a lumber market is a thing of the past, and the Pine-Tree State obtains much of the pine which it consumes from Canada and Michigan. As factors in the country's supply of lumber, the forests of Maine are not now worth consideration. An examination of their actual condition, however, shows that their future is not without hope, and that in no other part of the country can such valuable lessons in forest economy be learned. Professor Sargent, in this Bulletin, calls attention to the fact that "the system of cutting only the large trees and carefully protecting the remainder prevails in Maine, and allows the forest to be profitably worked at stated periods, varying from fifteen to twenty-five years." The state of public feeling which has made such a system possible has not yet extended much beyond the State, but the fact that forest-owners in Maine have been able to guard their property against fire successfully and introduce a sensible system of preserving their young and half-grown trees, indicates that a similar public sentiment may in other parts of the country attend enhanced values of forest property.

Fire is the greatest check to the spread of forest growth in the Eastern States; but, as we have more than once pointed out in these columns, means will be found to reduce the number and extent of forest fires as soon as the money value of the forest makes its preservation of prime importance to a community. Such has been the case in Maine. Its great source of wealth and prosperity existed in its forests. They were fast melting away, and what fires and the improvident methods of the old days had left became of such vital importance to the welfare of the whole people that the preservation of the remnants became possible. In Maine, forest fires are now of comparatively rare occurrence. The entire forest growth is not cut off, as in the Northwestern pineries; all trees below a certain size are allowed to grow for another harvest; and young pine, which is freely springing up in some parts of the State, is as carefully watched and guarded as a farm crop. Unfortunately, these wise measures were not adopted, or their

necessity even dreamed of, until the great pine supply of the State had been practically exhausted; but it is growing again, and, while Maine will never yield a second crop of pine equal to the first, it is not at all improbable that she will regain—and before many years—her position of first among the white-pine producing States.

Forestry Bulletin No. 16, with an accompanying map, treats of the pine and spruce supply of New Hampshire and Vermont. The original pine woods in both these States has entirely disappeared, although the valley of the Connecticut, the shores of Lake Champlain, and all of southeastern New Hampshire were once covered with vast forests of white pine. A growth of young pine has sprung up, principally in the southern part of these States, and these young forests furnished a cut of over one hundred million feet of lumber during the Census year. But these trees are cut too young, and at too great a sacrifice of future profit. The spruce forests of New Hampshire and Vermont, although reduced by fully three-quarters of their original extent, still cover considerable areas in the White Mountain region and along the ridge of the Green Mountain range. Young second-growth pine is carefully protected from fire, and "sprout" pine lands are now held at high figures; but the spruce forests are not yet as well preserved or carefully worked as in Maine, and they are too often the prey to destructive fires. It is worthy of remark that Burlington, once in the heart of great coniferous forests, and still the third lumber-distributing point in the United States—Chicago and Albany being the first and second—is wholly supplied with Canadian lumber.

THE BOMBARDMENT OF ALEXANDRIA—ITS RESULTS IN ENGLAND.

London, July 20, 1882.

Only nine days have passed since the bombardment of Alexandria, but in that time public opinion in England has passed through many phases, corresponding to the consequences which successively developed themselves as arising out of that event. The first impression of the news was on the whole one of satisfaction. Exciting news is, to a certain extent, pleasurable news; nothing could be more novel and exciting than the accounts which reached us hour by hour in England, and were reported in the editions of the morning and evening papers issued in quick succession all day long, chronicling, one might say, every shot as it was fired, every manœuvre of the iron-clads, so that we here seemed to be listening, like Wilfrid of Ivanhoe, in Scott's novel, to one who was describing each incident of the combat as it passed under the speaker's eyes. These accounts brought with them not only a relief from the long suspense with which the progress of the Egyptian crisis had been watched, but also a sense of exultation at the ease and success with which the overwhelming power of our fleet had been exerted—that sort of thrill of power which nations feel as well as individuals, and are hardly less apt to be carried away by. And there was also some self-congratulation at the proved efficiency of these huge iron-clad ships and huge cannon, on which we have spent such enormous sums for the last twenty-six years of peace. Thus the general sentiment of the nation was disposed to approve the act of the Government, and expect good results from the display both of the physical force and of the resolute purpose of the country.

There were, however, other voices heard. The Tories did not say much, because, as they had been calling out for strong action, they could not condemn the bombardment, and of course they were too prudent to commit themselves by applauding it. But the peace wing of the Liberal party—the section, small in number but respectable by the earnestness with which it holds its convictions—could not remain silent. Four or five of them, on the day after the fire on the forts, attacked the Government warmly in the House of Commons, declaring that we had no business in Egypt; that the presence of our fleet was unnecessary; that what had been done was done in the interests of British merchants and bondholders, and was opposed to the doctrines laid down by Mr. Gladstone and his colleagues when they denounced the aggressive policy of Lord Beaconsfield's Government. In the then temper of the House, this onslaught produced little effect. But next day the news arrived of the setting fire to Alexandria by Arabi and his army, and of the general plundering and murdering which followed. The first accounts, which described a general massacre of the Christian population, were corrected by subsequent telegrams. But enough remained to produce a profound and painful impression. A great city, one of the first seaports of the Mediterranean, reduced to ruins in two days, its population flying into the country, the European warehouses, offices, residences, with their contents, sacked or destroyed—this was a horrible and unexpected result of the bombardment, which chilled the satisfaction of the previous day. Those who had blamed the action of the Government pointed to its result as proof that they had been right. This, they said, is what comes of intervention. These horrors show that the enemy you despised was in desperate earnest. What will you do now? You have produced anarchy in Egypt. You will be forced to go on and enter on a regular war; you will have to conquer and occupy the country; and this will not only make you hated by the people, but involve you in difficulties, possibly in war, with France and the other five Powers. This view of the case was taken up, or, I ought rather to say, is being taken up to a considerable extent by the working classes. They have, of course, very little knowledge of the complicated circumstances of the case; but they have an idea that wars generally are undertaken for the pleasure and in the interest of the aristocracy and the moneyed classes; they do not see what our Government should have to do with Egypt, and when an appeal is made to them in the name of peace and humanity their first impulse is to respond. How far this line of sentiment, which is certainly strong among the working classes of London, prevails in the manufacturing and mining districts of the North we cannot yet tell. The whole matter is so new to the masses that they have hardly yet had time to take a side, much less to form an opinion. Much will depend on whether things go on smoothly for the next few weeks. The Tory leaders have generally abstained from expressing any opinion, waiting till the time should come for a formal debate in which the whole policy of the Ministry may be arraigned. But the light horse of that party have, as usual, been much more forward. Most of them are ready to approve the bombardment in itself as a necessary piece of severity. They accuse the Government, however, of gross want of foresight in not being prepared to follow up their first blow by landing troops, cutting off the retreat of Arabi and his army, and occupying Alexandria so as to save it from fire and pillage. The result of this slackness and timidity has been, in their view, to destroy the good moral effect produced by the destruction of the forts, as well as to involve the ruin of the city and the merchants whose fortunes were embarked there.

To these two opposite fires of criticism the Ministry reply by declaring that the attack on the forts was an act of self-defence, rendered necessary by the way in which they were being strengthened against the fleet. To have landed troops, however, would have been quite a different matter. That would have been an offensive operation, an act of aggression which would have been inconsistent with the declarations England had made on entering the Conference at Constantinople, and would have given reasonable offence both to the Porte and to the other European Powers. This is, of course, only the outline of their vindication of their conduct, which they support by insisting that the safety of Europeans everywhere through the East, and the free navigation of the Suez Canal, were both involved in the assertion of European authority and the punishment of Arabi. There is, doubtless, a good deal to be said for their policy in substance. The position was so difficult a one that no quite satisfactory issue from it could be looked for. And though every one, after the event, says that the burning of Alexandria was only what might have been expected, no one, in fact, predicted it, or advised that any preparations should be made for such a contingency. But, technically and logically, the Ministerial line of argument seems a narrow and barely tenable one. If the fleet was sent to Alexandria to protect British life and property, as Mr. Gladstone repeatedly declared, why should it remain there when all British subjects had quitted the city? Why take measures which have ended in the destruction of all the European property in the place? It may be that the fleet was not safe while the forts were being strengthened. But what occasion for the fleet to remain, seeing that it had taken every Englishman on board? The French fleet steamed away before the English ships opened fire. Could not the English fleet have done the same with no more loss of prestige than France has suffered? As to the landing of troops, could not the capture of Alexandria from the shore have been just as much, or as little, a measure of self-defence as its destruction from the sea? It has been necessary after all to occupy the town and hold it against Arabi. Might not this have been done from the first—with the additional advantage of compelling the army, caught in the town, to lay down its arms, and thus at one stroke freeing Egypt from military tyranny and from the danger of brigandage by the soldiers if they desert and scatter? Such are some of the criticisms which one hears on this first act of our armed intervention in Egypt. The next seems likely to be the despatch of a regular force, and the occupation, probably in conjunction with France, of the country. Unwelcome as this is to the general public opinion of England, the calling in of Turkish troops and reëstablishment of the Sultan's authority would be even less welcome; so that there will be little disappointment here if the invitation addressed by the Conference to the Sultan should be refused.

Meantime, it is not to be denied that the result of all this is further to weaken the Government. I do not speak merely of Mr. Bright's retirement, though that loosens their hold upon the Radical party and the Nonconformists. I refer rather to the general sense that they are engaged in a disagreeable task, which, like a coercive policy in Ireland, does not sit well on them, and is not likely to be very heartily performed by them. The feeling grows that they are unlucky; and although there is not yet anything that can be called disaffection, there is a sensible diminution of the enthusiasm which formerly attended, stimulated, almost glorified them. The sooner they can get rid of Parliament for the recess, this year to be broken by an autumn session, the better it will be for their own stability. Y.

A POLITICAL FORECAST.

LONDON, July 18, 1882.

THE days of the Gladstone Cabinet are, I suspect, numbered. The Ministry may not at once perish: there are many chances in favor of its hanging together for months; but its strength is gone, its life is ebbing away, and there is, in my judgment, the highest probability that Mr. Bright's retirement is only the most visible sign of a break-up of the whole Cabinet, which may be deferred for a time, but cannot be indefinitely postponed. This view of the state of affairs may, I frankly admit, be completely mistaken. Nothing is so rash as confident political prediction, and I assuredly make no claim to be a prophet.

There are, moreover, two or three circumstances which obviously tell in favor of the Government. If trust in Mr. Gladstone has declined, confidence in the Opposition has not increased. There is some difficulty in conveying to any one not on the spot the tone of feeling which prevails with regard to Lord Salisbury and his colleagues or followers. No one feels any intense hatred toward the Conservative leader or his party; no one supposes that a Conservative Government would be a specially bad Government, or, except perhaps as regards Ireland, a really reactionary Government. But, on the other hand, I have scarcely met with any one, whatever be his political bias, who professes confidence in the judgment or in the abilities of Lord Salisbury, or of the men who would necessarily be his colleagues. It were easy enough to pick out hundreds of persons who so detest Mr. Gladstone that they would see with delight any member of the House of Commons (unless it be Mr. Parnell) in occupation of the premiership. But even fanatics in whom hatred and distrust of Mr. Gladstone have overpowered every other sentiment, do not profess any particular regard for Lord Salisbury. Some of the bitterest attacks ever directed against his Lordship appeared, if my memory does not deceive me, in the pages of the *Pall Mall Gazette* before the conversion of that journal from Jingoism to Radicalism. Nor is the weakness of his opponents the sole security for Mr. Gladstone's continuance in office. Any candid observer of English public life must confess that Mr. Gladstone, whatever be his errors or weaknesses, towers by a head and shoulders above all other English politicians. As long as Lord Beaconsfield lived, this was not the case. Lord Beaconsfield's claims to a high rank among statesmen have been disputed, and not without reason; they will now probably continue to the end of time a matter of debate. Still, he was undoubtedly a man of rare talent. His opponents might deny both his administrative capacity and his political honesty, but he was one of those leaders in whom it was possible for his followers to have faith. At the lowest estimate any one could make of his talents, he was, as Mr. Bright termed him, the "mystery man" of his party. He was at least as conspicuous a figure on the stage of public life as Mr. Gladstone. As much cannot be said for any other among existing statesmen or politicians.

Sensible men, again, may well reflect that the present Cabinet, whatever its deficiencies, contains as much talent and character as could be found in any other conceivable Ministry. Mr. Lincoln's warning against "swapping horses when crossing a stream" expresses a principle which, rightly enough, always weighs greatly with cautious, considerate persons, who care more for the interest of the nation than for party triumphs or for party defeats. If you could poll England, you would, I take it, find that a large number of Conservatives, no less than of Liberals, were, at the bottom of their hearts, very averse to a change of Government at the moment England is passing through what may fairly be called deep waters both in Ireland and in Egypt. There is no inconsistency in distrusting Mr. Gladstone and at the same time wishing that Mr. Gladstone should for the present moment continue in office. There is, moreover, no clear sign that the majority of the electors do distrust Mr. Gladstone. On this point his assailants are constantly misled by the idea that the defects in the Premier which offend their judgment or taste are offensive to the Dissenters and workingmen who at the last general election forced him into power. It is hardly an exaggeration to say that the characteristics of the Prime Minister and his policy which offend persons whose tone of sentiment or of thought is expressed in the *St. James's Gazette*, are exactly the characteristics which have won the admiration and confidence of the English, and still more of the Scotch, democracy. The "preachiness"—if I may use the expression—of Mr. Gladstone's popular oratory; his desire to identify politics and morality; the heat or fervor which appears in every word that he utters; his trust in the feeling of the people; the very imprudence and recklessness with which he lets his words give immediate expression to ideas or emotions which more prudent men would keep buried in their own minds—are all traits which, on the whole, conciliate popular support just as surely as they shock opponents who can hardly acknowledge Mr. Gladstone's extraordinary oratorical and administrative abilities because of their intense dislike to his moral tone. Until the fact is established that the thousands who rallied round Mr. Gladstone in 1880 have ceased to believe in the leader who was then their hero, it were absolute folly to deny that Mr. Gladstone's own personality is a source of strength to the Cabinet.

The absence, in short, of trust in the Conservative leaders, the patent evils of a change of Ministry during a serious crisis, the hold of Mr. Gladstone on the sympathies of the electors, are all circumstances telling strongly in favor of the Cabinet's continued existence. Yet, when I have taken all these circumstances into account, and have attempted to the best of my ability to weigh their importance, I still come to the conclusion that the days of the Gladstone Ministry are numbered. My reasons for this opinion can be easily placed before your readers, who must judge for themselves of their value.

The first and the most patent danger to the Government is the loss of reputation which is sure to attend any Ministry who are forced, in appearance if not in fact, to repudiate the principles which they advocated while in opposition, or to carry out a policy more natural to their opponents than to themselves. Mr. Bright's secession from the Cabinet is, from this point of view, an omen of disaster. The member for Birmingham is a man governed rather by sentiment than by logic. His strength as a statesman has always consisted in his sharing and representing a special vein of political, moral, and religious feeling. His sympathy with the views and aims of Mr. Gladstone brought Mr. Bright into office, and has no doubt kept him there long after the time when, if he had followed the promptings of his own heart, he would have retired from the Chancellorship of the Duchy of Lancaster. His resignation shows that on one point at least Mr. Bright can no longer sympathize with and approve of the action of his former colleagues. To say this, is not to impute dereliction of duty or moral inconsistency either to the Premier or to the member for Birmingham. They probably each believed, and not without reason, that though their speculative convictions as to the circumstances under which England might justly engage in war differed, it was practically next to impossible that any case should arise under which either of them would be prepared to involve the country in warfare. The unforeseen case has, however, arisen, and the whole extent of the difference in principle between the Minister who was in office at the outbreak of the Crimean War and the orator who throughout his life has denounced no contest so bitterly as the war with Russia, has now become apparent to the whole world.

But Mr. Gladstone, when in opposition, undoubtedly derived a great deal of support from men whose feelings or convictions were those of Mr. Bright. On another appeal to the country Mr. Gladstone will find that this element of support is wanting. The mere defection of the limited body of political Quakers does not measure anything like the whole of the loss sustained by the Cabinet. During the electoral campaign in Midlothian Mr. Gladstone had the immense advantage of occupying a clear, definite, unmistakable position, from which he could appeal, as he did appeal, with untold force to the ordinary, everyday, and therefore strong, moral convictions of mankind. He was the opponent of every kind of aggression. He was the advocate of high international morality, as opposed to men who thought, or who appeared to think, that the interests of England, rather than definite moral dogmas, were the only sure guide in matters of foreign policy. As the practical result of his moral and political theories, Mr. Gladstone, and still more decidedly Mr. Gladstone's followers, urged upon England the necessity of turning away from the intricacies of foreign affairs, and of directing attention to the many reforms needed at home. Whatever else England might do, she was bound, above all things, not to aid or promote the spread of Turkish power or influence. We all know the fervor with which the electors answered to Mr. Gladstone's appeal. The Ministry were placed in office with what French politicians call a "mandate" from the constituencies. The Cabinet were to pursue peace abroad and reform at home. The mandate was thoroughly understood, and, as far as circumstances allowed, honestly obeyed. The retreat from Afghanistan, the treaty with the Boers, the vigorous attempt to settle the Irish land question, the avowed intention of carrying through a whole batch of domestic reforms, might exacerbate the already bitter hostility felt by large classes to Mr. Gladstone and his policy, but the earlier acts and intentions of the Ministry were precisely in conformity with their avowed principles, and with the wishes of their zealous supporters.

It is now clear that fate has been too strong for the Cabinet, and that Mr. Gladstone has been compelled to adopt measures which, in appearance at least, are opposed to the professions which gained him the triumph of 1880. He governs Ireland under a measure which, though in principle less objectionable than the Coercion Act which soon expires, may be described with some truth as the severest measure of repression passed during the last half-century. Ireland is full of discontent, Mr. Gladstone and the Liberal party are hated by the Home Rulers, and order is not restored. Abroad, matters look hardly better. Alexandria has been bombarded, English troops are landing in Egypt, Cyprus is found useful as a place of strength, Indian regiments are hurrying up to take part in proceedings which, if not technically warfare, have all the outward aspect of war, and, worst of all, the Turk is invited and pressed to exercise something very like the rights of sovereignty in a province which had practically ceased to form part of the Turkish Empire. All these things have an odd look. Appearances are, I think, to a great ex-

tent delusive. Mr. Gladstone's policy in Egypt, no less than in Ireland, admits, if not of perfect defence, yet of a good deal of explanation. It is not nearly as inconsistent with the principles avowed by him in opposition as it at first sight appears. But appearances are in this world a great power; and when Mr. Gladstone again appeals to the country, he will be forced to speak, not as a critic of others, but as an apologist for himself. An orator has lost half his power when he becomes an apologist. It is vain to hope that ingenious explanations will exert the influence of fervid denunciation: the triumphs of 1880 cannot be repeated. If the country were polled, the Cabinet would, it is likely enough, escape defeat, but an indecisive battle is a very different thing from a splendid victory; and I observe, without amazement, though not without reflection, that zealous Liberals do not at the present moment care to court an appeal to the constituencies.

Suppose, however, that (as I myself am inclined to think is the case) a more or less satisfactory defence can be made out for the conduct of the Government in Ireland and abroad, it is not at all certain that the explanations which save the character of the Ministry will not turn out to be arguments in favor of putting the Conservatives in office. If it be proved that Mr. Gladstone has, under the stress of circumstances, been compelled to use coercion in Ireland and to assert English power by force of arms in Egypt, the inference may perhaps suggest itself to the electors that the time has come for restoring to office statesmen who have always been ready to rely both at home and abroad on the use of force. Any one who examines the history of the last fifty years will soon find reason to believe that no Cabinet has ever maintained itself long in power after adopting a policy more suitable to the convictions of its opponents than to its own. The position of the Duke of Wellington after carrying Catholic Emancipation, the weakness of Peel after the repeal of the Corn Laws, the fate of the Aberdeen Ministry during the Crimean War, the fall of the Conservative Government after passing the Reform Act of 1867, are only a few of the facts which suggest the inference that for a Government to undertake work natural to its opponents is the surest way of undermining its own authority.

The second circumstance which bodes ill to the Ministry is that the Conservatives can, if they choose, force an appeal to the country. Mr. Gladstone and his colleagues hold that the passing of the Arrears Bill is essential to the restoration of order in Ireland. Lord Salisbury has undoubtedly the power of causing the bill to be thrown out in the House of Lords. If he takes this course, it is difficult to see how Mr. Gladstone can in the long run avoid either resigning or appealing to the country. If the Ministry accept the rebuff and drop the bill, their credit is gone; if they prorogue Parliament and bring in the bill again in another session, the Lords may again reject a measure which assuredly commands no great popularity in England, and may in effect refuse to pass it without a distinct expression of electoral opinion in its favor. The Conservatives, however, may, for the sake of giving some relief to the Irish landlords, or because of the great convenience to the Conservative party of throwing on Liberals all responsibility for exceptional legislation, let the bill pass. It is not, however, at all clear that with the passing of the Arrears Bill the troubles of the Government will be at an end. The Home-Rulers avowedly believe that a dissolution would give them many additional Irish seats. Whether this idea be true or not, I cannot say; but the existence on the part of Mr. Parnell and his followers of the conviction that a dissolution would increase their power, is of itself sufficient to make them active or passive allies of the Conservatives in any attempt to force on the Government an appeal to the people. As things now stand, there is, therefore, it seems to me, a fair chance that before long some question may arise on which Conservatives, Home-Rulers, and dissatisfied Liberals may coalesce and place the Government in a minority. Mr. Gladstone is assuredly not the man to cling to office after he has lost power. It is far more like him to yield to the impatience natural to a statesman who finds his policy thwarted through the coolness of friends or the recklessness of foes, and on the first serious defeat to resign an official position which can have no attraction to him after it has ceased to be the means of carrying out the policy which he approves. In one way or another, the Government, therefore, may, I believe, be sooner or later compelled to resign or to dissolve. The best that can at present be hoped from a dissolution is that the Ministerial majority may be lessened and not absolutely destroyed. If this be the best result which the Cabinet can anticipate, critics like myself, who have no wish except to see things exactly as they are, may not unnaturally come to the conclusion that the days of the Gladstone Ministry are drawing to a close. The assassins of the Phœnix Park and the incendiaries of Alexandria will, I suspect, be found to have dealt deadly blows to a Cabinet of statesmen who, whatever their defects and shortcomings, are more anxious to give prosperity to Ireland and to abstain from attacks on all foreign powers than any Ministers who during the century have held power in England.

A. V. Dicey.

THE ARCHIVES AT MARBURG.

Berlin, June 30, 1882.

Last month I spent about a week at Marburg. This city, a former residence of the old Landgraves of Hesse, is renowned in German history as the place where, in 1529, Luther and Zwingli met for the reconciliation of their views concerning the sacraments and other religious reforms ("Marburger Religions gespräch"). At about the same time (1527) the first Protestant university was founded there, which for nearly a century ranked foremost among the high schools of Germany, then sank into utter insignificance, although several prominent professors (and first among them, in 1800, the greatest scientific jurist of modern times, Friedrich Carl von Savigny) began their career at Marburg. Since the annexation of Hesse to Prussia it has again attained importance. While seventy years ago numbering 200 to 250 students, it now has nearly 800. The city is, besides, celebrated for the old church of St. Elisabeth (a classic specimen of Gothic construction of the thirteenth century), and for an old mediæval castle, uniting the different Roman, Gothic, and Renaissance styles of architecture, which dominates the surrounding country and looks into the beauteous and fertile valley of the Lahn.

However, I do not propose to enter into the details of the charming scenery which offers itself to the views of the tourist, but rather mean to confine myself to the noble old memorial hall which at present contains the public archives of the province of Hesse-Nassau. In Prussia the administration of the public records is effected in a very simple and efficient way. While all matters of general interest, such as treaties of the kingdom with foreign powers, matters of reform in domestic policy and general legislation, correspondence with Ministers abroad, motives for new laws, etc., etc., are preserved in the general state archives in Berlin, each province has an archive of its own, which contains the more local documents and papers referring to its old political development and history. At the head of the whole is a director, at present the celebrated historian, Heinrich von Sybel. The archives of every province also have a chief, who is subordinate to the general director, and to whom a number of assistants are attached. These officials must have studied at a university, and are only appointed after having passed an examination in history and its auxiliary branches, such as palæography, epigraphy, numismatics, diplomatics, and reading of old, especially mediæval, Latin records. They are advanced according to their abilities. The solid education and scholarship of these gentlemen enable them to render valuable service to those who study in the archives, access to which is exceedingly liberal. Down to 1840 you can obtain a sight of any paper you may desire; in case of need the proper officer not only hands it to you, but assists you in using it, and points out to you supplementary documents.

To return, however, to Hesse-Nassau. Parts of it belong to the oldest political districts and ecclesiastical foundations of Germany—*e.g.*, Fulda, with its bishopric founded by St. Boniface; Hersteld and Fritzlar, with their celebrated convents; Gelnhausen, one of the residences of Friedrich Barbarossa. All these, as well as the castles of the imperial princes, counts, and barons, have had to give up their manuscript documents to the Marburg archives. Besides imperial orders and papal bulls, I saw three parchments sealed by King Pipin, and a number of missive letters issued and signed by Charlemagne. The most important documents concerning the time of the Reformation, the reign of Philip the Generous, of Hesse, and the political negotiations preceding and following the war of Schmalkalden, are deposited there. The manuscripts specifying the position and conduct of William of Orange and his successors throw a very important light on the history of the war of the Netherlands with Spain. The documentary proofs of the important part the Hessian Landgraves took in the Thirty Years' War, and the rôle they played in European politics in the eighteenth century, are likewise preserved among the files of the archives. There is, in fact, no period in European history of the last eleven hundred years for which the historian will not find new and interesting manuscript materials in the Marburg Castle. The greater part of these papers are admirably arranged, the drawers in which they are kept being ventilated, in order to keep them from moulding. It will, nevertheless, be at least ten years yet before the able archivist, Dr. Könnecke, will succeed in completing the necessary arrangements for making all these treasures available to the historical student.

The most interesting portions of the archives for an American reader are the papers referring to the sale of the Hessian troops to England and their participation in your Revolutionary War. Out of about thirty volumes containing the details of the sale of Hessian soldiers—beginning with the Venetian campaign against the Turks in Morea (1675) and coming down to the English war in Holland and Belgium against republican France (1794)—at least ten folios contain the particulars about the part which the Landgrave of Hesse and his troops took in your Revolutionary War. These volumes are splendidly bound in parchment, and were taken by the Landgrave (Elector) when, in 1806, flying before the French invasion, first to Schleswig and afterward to Prague, from which latter city they returned with the reinstated Elector to Wilhelmshöhe, near Cassel. Here they were discovered in an attic of the palace by the above-named Dr. Könnecke, at whose suggestion they were incorporated with the archives of Marburg.

These volumes are a real treasure for every historical student, as they not only contain the diplomatic negotiations of the Landgrave and of his Minister, Schlieffen, with the English Government, and the respective treaties founded thereon, but also every day's orders and the letters issued and written by the Landgrave to his generals and colonels in America, as well as their answers and reports on the condition and conduct of their troops, well-drawn maps and sketches of the localities having relation to the Hessian headquarters.

Let me point out, as belonging to one of the most important episodes of the war, the proceedings before a court-martial on the capture of Trenton. They are specified in three volumes, and give the minutiæ of the examination of about fifty witnesses, participators in that affair. The Landgrave was quite shocked at this disaster, which turned the scales of the war in favor of the American cause, and could never forget and forgive it to his officers. Not only did he recall the chief commander of his troops, General Heister, although this meritorious officer could not be made responsible, but during the whole war he did not promote a single inferior officer who, under the command of Colonel Rall, had only obeyed orders. I beg here to remark in parenthesis that Rall was not at all the ridiculous figure that Washington Irving makes him, but an earnest and brave man, so much of a regular that he despised the "undisciplined peasants," and by his defeat was severely punished for his contempt of the enemy. He very well knew how to command a regiment, but could not handle a large force of troops on his own responsibility. Heister's successor, General Knyphausen (the captor of Fort Washington), was for years urged by the Landgrave to finish and send in the proceedings of the court-martial instituted against the surviving officers and men of Rall's command. Knyphausen, however, from delicacy of feeling for his unfortunate brethren in arms, from year to year, under all possible pretexts, delayed the transmission of his final report, and it was only in the last year of the war (1783) that he complied with the Landgrave's strict and ungracious orders. Finally, the court-martial censured only the dead officers and acquitted the surviving ones. Although these papers do not throw much new light on the affair at Trenton, they are full of interesting particulars which confirm the high estimate of all competent military critics of Washington's bold movement and its splendid execution. The Landgrave, I must confess, appears in his directions a much better man than a mere dealer in human flesh. He is his own minister of war, and a very good one, too; he knows and cares for everything, is pedantic, strict, and active, but of a small mental horizon, while he is filled with the pride of his position as ally of Great Britain and as chief of a brave army.

Another almost equal number of Hessian papers of the same character were, after the annexation of Hesse to Prussia, sent to Berlin, and are now on file in the archives of the grand staff of the army under Marshal Moltke. They formerly belonged to the Cassel Ministry of War, and were indexed by the former Hessian Colonel Sturmfeder, but are not so well preserved as those at Marburg. They refer chiefly to the transactions of Hesse-Hanau with England; give all the particulars about the financial business of the two contracting parties; the income from which was about £100,000 higher in favor of the Hereditary Prince than stated by old Schlaezer, Bancroft, and Kapp. Another interesting part of these papers forms a collection of about a hundred letters written by officers to their relatives at home, who were directed by the Prince to send them to him for his perusal. They give some charming sketches of American society at the time, and the elegance of manners prevailing in the old colonial families like the Beekmans, Phillipses, Morrises, and others. These letters bear the imprint of reality and truth, and are the more valuable as their writers, although enemies and foreigners, are involuntary witnesses and reporters of the real state of American society.

Another very interesting relic of old times I found at Marburg, in the possession of Dr. Könnecke, who accidentally had discovered it at Halberstadt, in a volume containing some twenty or thirty old pamphlets. It is the only copy of 'Sex Elegantissimæ Epistolæ' printed by William Caxton in 1483, and described under No. 52 in the work of Mr. W. Blades, 'The Biography and Typography of William Caxton' (London, 1877). The little pamphlet, containing only some forty pages, is unusually well preserved, with even uncut leaves. I do not admire the Caxton prints, since for elegance of cut of types, solidity of paper, and clearness of print they are much behind the old German and Italian incunabula. But tastes differ, and English book maniacs even exceed those of other countries. Mr. Könnecke was offered £300 by the British Museum for the little pamphlet; but being aware of the extraordinary value of this *unicum*, he asks £1,000, and is sure to get it. † † †

THE CORRESPONDENCE OF GEORGE SAND.—III.

PARIS, July 6, 1882.

IN the year 1836 Madame Sand was engaged in her suit of separation from M. Dudevant, her husband, and was meanwhile making a revision of 'Lélia.' She expressed her ideal at that time to Madame d'Agoult, who was living at Geneva with Franz Liszt: "To throw yourself in the bosom of nature; to take her really as a mother and a sister; to cut away from life stoically and religiously what only belongs to vanity; to resist the proud and the wicked; to be humble and small with the unfortunate; . . . to live on almost nothing; to give away almost everything, and so to reëstablish the primitive equality and to revive the divine institution—such is the religion which I will preach in my corner." Lélia belonged to this religion; she was above love, though she could inspire it; she saw the virtues of a convict. She was, in fact, George Sand herself, with her curiosity and her insensibility. Madame Sand had such a strong fibre that when she wished to hear the piano she crawled under it, so as to absorb the sounds better. She recognized in Liszt the only artist who could give life to the wooden instrument. It is surprising, at the same time, to find her so poetical. Read this, for instance:

"I have moments of spleen; but I resist and I pray. To pray is an important, a difficult thing. It is the end of the moral man. I am only beginning to learn; I am at the lowest step of the staircase of Jacob. So I pray seldom and badly. But, badly as it is, I have a foretaste of infinite ecstasy and of emotions similar to what I experienced in my youth, when I thought that I saw the Virgin, a luminous apparition, pass like a sun over me. Nowadays I have only visions of stars. . . ."

She was learning astronomy; she always felt attracted toward science, but her science was poetical. She could not commit the names of the stars, nor find her way in the longitudes and the latitudes. She admired, but admiration is perhaps better than knowledge:

"No star," she says, "resembles another, when you look attentively. I had never understood this before this summer. Look, if you wish to understand me, at Antares, or the South, from nine to ten o'clock, and compare it with Arcturus, which you know. Compare Vega, so white, so tranquil all night, with the Goat, which jumps into the sky toward midnight, and which is red, brilliant, burning, as it were. Apropos of Antares, which is the heart of the Scorpion, look at the gracious curve of this constellation; it is something to kneel before. Look also, if you have good eyes, at the whiteness of the Pleiades; admire the delicacy of this little group at the dawn of day, in the midst of the nascent aurora. . . . God is the master of these treasures."

This is, in my opinion, perhaps the best of George Sand: it is her faculty of admiring, and of expressing her admiration. She was essentially a descriptive writer; in her worst novels there are pages which are as good as anything Rousseau ever wrote on the Alps or the Lake of Geneva; she was a naturalist and a poet. Her moral walk was mischievous—she had, so to speak, no moral sense; but she always recognized the "Deus ignotus," the hidden divinity which breathes and lives in nature, in plants, in things animate and inanimate. As soon as she was out of humanity's reach, she became noble and pure. She really hated mankind; it was troublesome; nature was always calm and serene:

"I have had my fill (*j'ai plein le dos*) of all great men. . . . Let them be sculptured in marble, or melted in bronze, and speak no more of them. As long as they live, they are wicked, persecutors, fanatical, despotic, bitter, suspicious. . . . They are worse to their friends than to their enemies. . . . Remain always good, stupid even, if you can."

This new volume of letters, which extends from 1836 to 1848, fully confirms what I said in my analysis of the first volume. Madame Sand was a man in character; she had none of the delicacies of her sex; she never knew what love was. Though she wrote volume after volume on the passion of love, she was only open to the sentiment of friendship; she often said of herself, "I am a *bon garçon*."

Madame Sand paid a visit to Madame d'Agoult and to Liszt, in Geneva, in September, 1836. She disliked Paris, and when she could not be at Nohant, she travelled as much as she could. "I hate Paris; I never remain an hour longer in it than I need. I become ill-tempered and insupportable there; I am always out of breath, busy, enraged against the fools who separate me from my friends—never doing what I wish, what I ought—always impatient to shake off the dust of this accursed city." She was becoming more and more republican and socialistic. She had made the acquaintance of the leading Saint-Simonians, and we find her scolding some of them for their moderation.

"I tell you," she writes to M. Guéroult, "that I have never known, and that I know, but one principle, which is the abolition of property." The time has not come, she acknowledges it, for the application of the principle, but she and a few others ought to keep in their hearts "the good principle, pure, without a spot, without the shadow of concession to any Jesuitical metaphysics and to a pretended morality in which men don't believe. A time will come when this good principle will have its day. We shall be no more, but our sons or our nephews, having received it from us, will speak and do something."

She was at times heartily tired of her work. She writes to Jules Janin: "You have no idea how disgusted I am with literature (I mean with my own). I am passionately fond of the country. I have all the indoor tastes: I love cats, dogs, children especially. I am no longer young. I should like to sleep at night. Help me out of the claws of Buloz, and I will bless you every day of my life. I will give you my manuscripts to light your pipe."

One of the least known and most interesting incidents in the life of Madame Sand is her journey with the famous Chopin to the island of Majorca. Chopin was consumptive, and Madame Sand took him with great difficulty from

Paris to Majorca. She had her two children with her, Maurice and Solange. Consumption is a rare malady at Majorca, and it was considered there contagious in the year 1839. Chopin and his companions were soon looked upon as if they carried the pest, and as pagans to boot, for they did not go to mass. The proprietor of the little house which Madame Sand had taken turned them out most brutally. Chopin could not well be transported back to France; Madame Sand fortunately discovered, in an old, abandoned convent of friars, a Spanish family, which was hiding for political reasons. This family, wishing to emigrate to France, sold all its furniture to Madame Sand. She lived in the Certosa of Valdemosa like an exile.

"Valdemosa," she writes, "a poetical name, a poetical place, an admirable, sublime nature, with the sea on both sides of the horizon, with formidable mountains above us. The eagles came over the orange trees of our garden, a line of cypresses ran from our house to the bottom of the gorge; under our feet were terraces covered with myrtles and palm trees. Nothing more magnificent! But it is right to lay it down as a principle that, where nature is good and generous, men are wicked and avaricious."

Madame Sand could hardly procure the necessaries of life, even for gold. She could not procure servants; nobody wished to take care of a man in consumption. With great difficulty Chopin had obtained a piano, and he consoled himself with playing in his cell. What music must have issued from the dying man of genius under that incomparable sky beside the blue Mediterranean Sea! Madame Sand gave lessons to her son. She worked day and night. Chopin composed; but after two months the climate became too cold, the clouds began to hang over the mountains, the roads became torrents. "All this would have been fine if poor Chopin could have borne it. Maurice did not suffer from it. The wind and the sea sang in sublime tones, beating our rocks. The immense and deserted cloisters creaked over our heads." There were no chimneys; it was impossible to make a good fire. It soon became necessary to quit the island; and as there was no carriage, Chopin had to be transported to Palma on a litter. On arriving at Palma he spat blood abundantly. The next day Madame Sand embarked with him on the only steamer of the place, which then took only pigs to Barcelona. Chopin arrived at Barcelona miserably ill. There Madame Sand, thanks to the French Consul, had him transported to a French man-of-war, and the French doctor of the ship took excellent care of him. The innkeeper of Barcelona demanded the price of a bed, in which Chopin had only slept once, as it was an *infected* bed. "Spain," exclaims Madame Sand, "is an odious nation." From Barcelona they went to Marseilles, and Chopin bore the crossing very well.

This second volume of the Correspondence is, on the whole, more interesting than the first; it is more rich, more abundant, more philosophical. The letter of September 27, 1841, for instance, to M. Charles Duvernet, at Lachâtre, contains a complete programme of religious philosophy. Madame Sand was at the time enraptured with the philosophy of Pierre Leroux. "I am certain," she writes, "that one day people will read Leroux as they read now the 'Contrat Social' of Rousseau. . . . When I was a sceptic, when I wrote 'Lélia,' with my head aching with sorrows and doubts on all things, I adored the goodness, the simplicity, the science, the depth of Leroux; but I was not convinced. I regarded him as a man who was the dupe of his own virtue. Now I feel differently; if I have a drop of virtue in my veins, I owe it to him, whom I have studied for five years." Age made her more calm, more hopeful, more confident in the goodness of God. She was no longer blinded by her passions; she did not feel so much the spur of personality. She always maintained that people gain by losing youth, since they lose at the same time what deforms truth, and their hearts get enlarged and milder. She felt like the conqueror after the battle, and said to herself at times: "I have played my part; the hour of rest is coming." The hour of rest never came, but her philosophy constantly became more practical. "We must live," said she, "as we ride: be very supple, not unreasonably oppose the horse, and have a very light hand; trot when we are in a hurry, and go pacing or jogging when there is a good sun and no hurry. God has done all things well."

These letters are full of such passages, which are at times charming. They are incoherent, they are addressed to very extraordinary persons, and many things are hardly intelligible now. They form, in their collection, a very curious commentary on the literary work of one of the most gifted and extraordinary writers of our time.

Correspondence.

BRITISH RULE IN INDIA.

To the Editor of The Nation:

Sir: 'England's Work in India,' by W. W. Hunter, C.I.E., LL.D. (Smith, Elder & Co., 1881). This is the title of a pamphlet of 137 pages just sent to me by a correspondent in Ranikhet, in the Northwest Provinces, India, who is himself much interested in the improvement, and especially in the education, of that country. Mr. Hunter, the writer of the pamphlet, is at present engaged as president of a large and important committee now considering the best method of increasing the education of the people. He is the author of numerous books and papers on the subject of India, and it is believed no higher authority can be found. The spirit in which he writes is well expressed in the following words on page 135:

"I do not believe that races among whom we raise a taxation of 35 millions sterling, and into whom we have instilled the maxim of 'No taxation without representation' as a fundamental right of a people, can be permanently excluded from a share in the management of their finances. I do not believe it practicable to curtail for long the right of the freest criticism on their rulers, to 191 millions of British subjects, who have the speeches of our great statesmen at this moment ringing in their ears."

The pamphlet says, page 133: "An electoral body is being developed in India by the municipalities and local district boards. There are already 1,163 members in the municipal bodies of the Bengal and Madras Presidencies alone." And yet there are great difficulties in the way of this development, growing out of the habits, traditions, and want of education of the people. My correspondent at Ranikhet writes:

"As a fact, there is a large number of municipalities in Upper India with elected members; but it is found in almost every case that the people cannot be induced to go to the poll. They look upon an election as so much wasted power and trouble. People at home will not understand or believe this, and no doubt your countrymen would also find it hard of understanding."

Placing the right of suffrage in the hands of the uneducated and now incompetent millions of India is a measure which it is to be hoped will be introduced gradually and cautiously; but the interesting question which the pamphlet endeavors to answer is, whether or not British rule, after more than one hundred years of trial, has conferred benefit on the Indian races. Mr. Hunter well says that "no government has a right to exist which does not exist in the interests of the governed. The test of British rule in India is not what it has done for ourselves, but what it has done for the Indian people. By this test our work in the East must stand or fall."

Here, then, are some of the results: The multitudinous native states, the isolation of which was only broken by merciless wars, are now trading quietly with each other, bound together by railways and roads, by post and telegraph. India is a great, three-cornered country, stretching southward from Asia into the sea. Its northern base rests upon the Himalayan ranges; the chief part of its western side is washed by the Indian Ocean, and of its eastern by the Bay of Bengal. But there are gateways left by nature on the northeastern and northwestern corners, and through them during 700 years the warring races of Central Asia and Afghanistan poured in hosts of from twenty to a hundred thousand, paying for nothing, devastating every town, cottage, and farm-yard in their path, and burning and slaughtering on the slightest provocation, and often in mere sport. An invasion also meant usually a grand final sack and massacre at the capital of the invaded country. In the middle of the last century six such inroads on a great scale took place in twenty-three years.

The sea, which forms the natural defence of the rest of the country, was in like manner only a source of new dangers. On the Bay of Bengal the pirates from the Burmese coast sailed up the great rivers, burning the villages and massacring or carrying off into slavery the inhabitants. On the other side of the peninsula, in the Indian Ocean, piracy was conducted on a grander scale. Wealthy rajahs kept up luxurious courts upon the extortions which their private fleets levied from trading vessels and from the villages along the coast. The truth is, that the natural defences of India—the mountains and the sea—were in the last century equally powerless to protect the Indian races. Absolute protection is now everywhere extended by the powerful arm of Great Britain.

But protection from within is as necessary as protection from without. Anarchy breeds lawlessness and crime. The country was infested by professional banditti, formed into regular communities, and subsisting by spoil. There were *thugs* and *dacoits*, or hereditary stranglers and gang-robbers, who thought none the worse of themselves for their profession, and were regarded by their countrymen with an awe which, in the last century, could hardly be distinguished from respect. Now a completely organized police, and a criminal code framed by a commission composed of such men as Lord Macaulay and Judge Fitzjames Stephen, have changed all this, and, strange as it may sound, there is to-day less crime in India than in England.

"In the last century education in India was a monopoly in the hands of the priests—a power which they employed to subjugate the minds of the people. Under British rule education has been taken entirely out of the hands of the priests and has become the great emancipator of the Indian races. In ancient India a Brahman was forbidden, on pain of death, to teach the sacred books to the masses. . . . The Hindus were taught from their earliest childhood that they must remain imprisoned for life in the caste in which they were born."

Now there are two millions of boys and girls receiving public instruction.

"These two millions of native children are learning that every occupation and every profession in British India is open to every boy on the benches of an Indian school. . . . The rising generation in India have been freed from superstitious terrors; they have been led to give up cruel practices, and have learned to detest

and despise their forefathers' bloody rites. Widow-burning, infanticide, hook-swinging, self-mutilation, and human sacrifice—these are a few familiar relics of the old bondage under which the Indian intellect cowered and the Indian heart bled. Great as has been the material progress of India during the past century, its emancipation from ignorance and priestcraft forms a far more splendid memorial of British rule."

Another result is the revival of letters. The vernacular journals now exceed 230 in number, and are read every week by half-a-million of people. In 1878, 5,000 books were published in India, besides a vast importation from England. Of the printed matter, only 500 were translations, the remaining 4,500 being original works. Any one who has seen the poetry of Toru Dutt will acknowledge that poetic genius of a high order still survives in the Indian race.

The drama has been in all ages a great educator of the Indian races. The native theatre forms the best, indeed the only, school in which an Englishman can acquaint himself with the indoor life of the people. He suddenly finds himself in an era of intense dramatic productiveness.

Great cities have sprung up: Calcutta and Bombay have each about three-quarters of a million of inhabitants.

The foregoing gives the favorable side of Indian life, but there is another and a gloomy one. The great evil consists in a crowded population of small cultivators without capital, and with no restraints on marriage. Each Hindu marries as a religious duty, and marriage takes place at the close of childhood, quite irrespective of there being any means of subsistence. It is estimated that the population increases at the rate of two millions a year. The extent of the evil may be thus stated: Two-fifths of the people of British India enjoy a prosperity unknown under native rule, other two-fifths earn a fair but diminishing subsistence, but the remaining fifth, or nearly forty millions, go through life on insufficient food; and this number is constantly increasing. This is the fearful problem which remains to be solved; and it becomes intensified in importance when it is remembered that a failure of the crops, to which that burning land is always liable, may cause a famine which may sweep off in one season millions of the inhabitants.

On this subject, Mr. Hunter says, page 81:

"I do not, however, agree with those who think the problem insoluble. The permanent cure for over-population rests with the people themselves, and consists in those restraints upon marriage to which all nations of small husbandmen have sooner or later to submit. But we cannot wait till that compulsory lesson is learned, but must meet the difficulty by the resources of civilization. These resources may lighten the pressure of the population on the soil in three ways: first, by withdrawing large numbers to non-agricultural industries; second, by distributing the pressure over new or underpopulated tracts; third, by increasing the produce of the existing area of cultivation."

In the first direction, something has already been achieved. The new industrial life of India is already feeding millions of mouths, and before ten years are over will feed many millions more. India can command the cheapest and most dexterous manufacturing labor in the world. The country is also apparently on the eve of great mining enterprises. No one would have predicted in 1855 that Indian exports would rise from 20 to close on 70 millions during twenty-five years, and no wise man will now venture to predict the limits of the industrial development of India before the close of this century. In the second direction, also, something has been done to lighten the pressure of the people on the soil, and the Government is now reconsidering the question of encouraging both capitalists and laborers in the work of transferring the population from overcrowded to the underpeopled provinces. In the third direction, Mr. Hunter gives his reasons for thinking that improved methods of husbandry and irrigation will accomplish important results.

While the actual taxation for ten years ending in 1879 averaged 35 millions of pounds sterling, it has now reached 40 millions—not a large sum per capita: not nearly as large as it was previous to British rule and when the population was much less, but large in view of the poverty of the people.

In this communication I have made use of the ideas, and even of the language, of Mr. Hunter, often without finding it convenient to use quotation-marks. My object in writing is to correct impressions in regard to British rule in India which I cannot but think are erroneous, and which recent articles in the *Nation* strongly tend to create. G. W. B.

BALTIMORE, July 19, 1882.

Notes.

A WIDE circle of readers will be pleased to learn that Mr. Joel Chandler Harris is engaged upon a volume to be called 'Nights with Uncle Remus,' which will give a wider range to plantation subjects than the previous volume did; and also upon a story of slave life in the South.

Harper & Brothers will shortly publish 'Outlines of Ancient History,' by P. V. N. Myers.

A new metrical volume, 'Swabian Stories,' by Theodore Tilton, and 'Tristam of Lyonesse, and Other Poems,' by A. C. Swinburne, are promised immediately by R. Worthington.

McPherson's 'Hand-book of Politics' for 1882 will be ready soon after the adjournment of Congress. Like its predecessors, it records the political and Congressional events of the Representatives' term of two years. The indispensable character of this work makes a mere mention of its appearance sufficient. The publisher is James J. Chapman, Washington.

Funk & Wagnalls have in press 'The Schaff-Herzog Encyclopædia of Religious Knowledge,' of which Dr. Philip Schaff is the editor. It is based on the 'Real-Encyklopädie für Protestantische Theologie und Kirche' of Herzog, Plitt, and Hauck, with the full approbation of these editors.

Houghton, Mifflin & Co. have brought out in neat gray paper covers for summer reading Howells's eminently seasonable stories, 'A Chance Acquaintance' and 'Their Wedding Journey.'

Walton Van Loan, Catskill, N. Y., has issued a crude colored lithographic panoramic view of the Catskill Mountains, as seen from the east bank of the Hudson. The several peaks, hotels, towns, and other features of the landscape are helpfully designated.

No. 2 of the *Library* of Cornell University contains a desirable account of the apparatus—grammars, texts, dictionaries, and reference works—for the study of the Egyptian hieroglyphs; and seventeen pages of classified titles of works relating to mathematics, covering so far about one-eighth of the so-called Kelly Mathematical Collection of the Library.

The official announcement concerning the American School of Classical Studies at Athens states that the school-year will extend from October 1 to June 1, and members will be required to prosecute their studies during the whole of this time in Greece, under the superintendence of the Director (Prof. W. W. Goodwin). During the rest of the year they may study where they please. The school studies will be definite, and one or more theses yearly will be expected upon them from each student. There will be no school fees, but also no scholarships except such as may be offered by individual colleges. The School will extend reasonable facilities to Americans residing in Greece, but not formally enrolled as students.

The *Penn Monthly* has ceased to exist, and is to be regretted as an enterprise undertaken in good faith, and dealing with a more serious line of topics than the ordinary magazine. At one time it seemed as if the advocacy of protection were its chief *raison d'être*.

One of the greatest curiosities on the Continent of Europe, the Maison Plantin at Antwerp, is briefly described, with illustrations, in the *Portfolio* for July (J. W. Bouton). The views, however—one interior and two exterior—are rather tantalizing when one considers how the typographic treasures preserved in this museum lend themselves to reproduction.

For the first time the venerable 'Almanach de Gotha' is supplemented by an 'Annuaire,' intended to perfect the list of diplomatic and consular agents of the civilized nations of both hemispheres (New York: B. Westermann & Co.). It is identical in form with the 'Almanach,' but is not more than one-quarter as thick. It first gives the Ambassadors, Ministers, etc., of each country, and immediately afterward the Secretaries, Attachés, etc.—all arranged alphabetically for ready reference. Then comes a list under each country of the diplomatic and consular corps resident therein, in alphabetical order (*a*) by nationality, (*b*) by place of residence. Finally, the entire *personnel* is indexed. The national colors occupy four colored plates at the end. The editors crave and merit indulgence for the necessary shortcomings of a first edition. The 'Annuaire' will appear regularly in the middle of the year.

The bi-monthly *Lettres Chrétiennes*, published at Lille, is hereafter to contain an analysis, prepared by M. Ulysse Chevalier, of periodicals and of the transactions of learned societies, over two hundred in number, so far as they contain articles on the subjects which this periodical treats—namely, literature, criticism, education, the defence of religion, and philological or historical learning.

A striking bust of the historian Lanfrey, by the sculptor Mezzara, has been placed in the Town Hall of Chambéry, his native place.

The latest bibliography is Wagnerian. Nicolaus Oesterlein, honorary member of the Vienna Wagner-Verein, and ardent collector of everything in print relating to the master, has prepared an elaborate 'Catalogue of a Richard Wagner Library.' This work, of which Mr. Christern has received the prospectus, is divided into six parts, beginning with a record of all that has been written by Wagner himself, and including references to all that has been said for and against him. There will be a Baireuth section, and one entitled "Curiosa," in which the humorous element will not be lacking; an appendix on the sources of Wagner's *Stoffwahl*, and a full index. Moreover, yearly additions will continue the Catalogue indefinitely. The Brothers Senf, in Leipzig, are the publishers.

—Apropos of our note (in No. 890, p. 53) regarding military prison life in the United States regular Army as pleasanter than in the British service, a correspondent writes: "One of the best buildings at Fort Snelling is that in which sixty convicts—mainly recaptured deserters—have been gathered from all parts of the Northwestern department. I have tasted their bread, made of the world-famous flour, Minnesota *Straight*. There is no better brand. Their labor is out-doors, and light, for there is little to be done. Their life is easier than that of the

scanty garrison, for they sleep out their full sleep every night, while every man of the soldiers outside must stand guard every other night for four hours—a task doubly harassing because broken into two watches. I saw two files of soldiers load their guns and escort the prisoners to their work, yet was told that escapes were no rarity. A week before, four convicts were at work near the river, one of whom, as their sentinel stooped to drink, pushed him in, while another, seizing his gun, forced him to walk on before the squad for half-a-dozen miles into the woods, and then permitted him to return unarmed, while the deserters had been no more heard of. After all, perhaps Fort Snelling malefactors lack one mitigation of their seclusion which has been enjoyed by the inmates of the Wisconsin State's-prison at Waupun. There a prima-donna of no small local celebrity came in and sang all her favorite airs to the congregated criminals on Sunday, while the price of admission to her week-day concerts in the neighborhood was too high for workingmen to afford that luxury. Outsiders there complain that sentimentalists will do nothing for a poor fellow till he is *done for*—or has done something dreadful."

—"J. D. B." writes us, referring to an extract we recently made from Ireland's 'Emerson':

"The prayer at the close of Emerson's Middlebury address, you speak of (vol. xxxv., p. 17, i.) as by 'a Massachusetts clergyman,' was in fact offered by Rev. Stephen Martindale, the Congregationalist minister of Wallingford, Vt. By two or three witnesses let every word be established. My wife and I were both there, heard the prayer, knew the maker of it, and agree in our testimony."

—Under the title of "Notes" on the native trees of the lower Wabash and White River Valleys, Mr. Robert Ridgway contributes a valuable paper to the current volume of the Proceedings of the National Museum, the result of long and careful observations made by himself and other naturalists upon the forest growth of southern Indiana and Illinois. The region in question is of special interest, because here many of the peculiarly Southern trees, like the pecan, the water locust, the over-cup oak, and the bald cypress, reach their Northern limits, and because this forest is hardly surpassed by any other in the number of species of which it is composed, and the magnificent development attained by many individuals. The forests of western Florida or southern Arkansas are perhaps richer in species, but nowhere in the whole of Eastern America have as many large specimens of as many species been recorded as Mr. Ridgway finds in the lower Wabash Valley. Nearly all of our largest and most valuable broad-leaved trees are here found associated together; and in a single square mile of woods 75 species of trees, nearly all of the first class, were detected by him, or nearly as many as grow on the whole European continent. By actual measurement, 34 species are found to occasionally exceed 100 feet in height, while 17 others, although not measured, are believed to attain a height of at least 100 feet. The tallest individual measured, a tulip tree, was 190 feet in height, and individuals of 10 other species exceed 150 feet.

—Mr. Ridgway calls attention to the fact that the numerous small prairies which were common in the Wabash Basin at the time of its first settlement have become transformed into woodland, and that owing to this gradual change of prairie to forest the actual area of forest in Wabash and the adjoining counties in Illinois is greater than fifty years ago. Extensive woods of oak and hickory more than eighty feet high, and with trunks nearly two feet through, are now growing on what was open prairie within the memory of some of the present owners of the land. This is interesting as a slight indication of the solution of the mystery which involves the origin of the prairies, while the rapidity with which these new woods have sprung up shows that the reproduction of our failing forests can be accomplished in a shorter time than is generally supposed, if proper consideration and attention can only be given to the subject. Mr. Ridgway's paper is a most important contribution to the knowledge of our trees, and it is greatly to be desired that local botanists should more generally follow his example, and record their observations upon the original trees and woods of their neighborhood before these shall have disappeared from off the land.

—The late George P. Marsh's 'Compendious Grammar of the Old Northern or Icelandic Language'—the earliest Icelandic grammar which saw the light outside of Scandinavia—was written in 1834-5, but was not printed until 1838. It was not a mere translation, but was compiled from the three grammars of Rask, printed at Copenhagen (1811 and 1832) and Stockholm (1818), with noteworthy improvements in the sections devoted to inflection, and much new and valuable matter in the treatment of the syntax. A considerable portion of the work was printed during the author's absence from Burlington, and he was obliged to trust the proof-reading to a less competent person, so that the volume contains some errors of the press. For this reason the book was never published, but copies were freely given to students of the ancient Northern tongue. Mr. Marsh's own knowledge of that tongue has perhaps not been excelled, extending even to a complete mastery of the complicated metrical system of the skálds, enabling him to read the most difficult old Icelandic verses with ease. His papers on Icelandic literature and philology, contributed to the *American Whig Review*, the *American Eclectic*, and various foreign and domestic journals, still remain the best essays by an American on these subjects, and well deserve republication. His collection of Scandinavian books, which a few years ago was deposited in the library of the University of Vermont, is especially rich in editions of the classical works of Iceland, a department to which he continued to add even in his latest years. With the late Professor C. C. Rafn, Secretary of the Royal Society of Northern Antiquaries at Copenhagen, Mr. Marsh conducted a correspondence which extended from 1833 to Rafn's death in 1864. Several of his letters are published in 'Breve fra og til Carl Christian Rafn' (Copenhagen, 1869). After the first one, dated Burlington, October 21, 1833, they are all written in thoroughly idiomatic Danish. Professor Rafn was accustomed to state that in the whole correspondence, which was largely written before Mr. Marsh had ever visited any part of Scandinavia, he had detected but a single grammatical error on the part of the American scholar—a mistake in the gender of a noun. He wrote Swedish, too, with equal correctness—not an easy task to a foreigner familiar with Danish, owing to the close similarity and delicate divergences of the two tongues; and his acquaintance with the more southern languages of Europe was almost as exact. He possessed one of the broadest of minds, with an abnormally absorptive memory, and his knowledge ran in many varied, but never shallow channels. At one time he was the only authority in this country on the art and history of engraving, and made considerable collections, which were subsequently sold, and are now, if we are correct, preserved in Washington. Officers of the Army were wont to envy his profound acquaintance with military science, while naturalists were amazed at his far-reaching studies in nearly every department of physical investigation. In fact, specialists of any kind rarely conversed with him without feeling sure that he had devoted himself, with extraordinary zeal, to their own particular department. But, like most men of this class, his published works do not fairly represent the immensity and variety of his attainments.

—The 'Annual Register' for 1881 (London: Rivingtons) is sure to be a much-consulted volume of the series, so many germs of great political changes are contained in it. The Parliamentary revolution begun by the Parnellites in fighting the Land Bill; the short-lived Ministry of Gambetta; the French occupation of Tunis, of which the real causes are clearly set forth; the military *coups d'état* in Egypt; the assassination of the Czar Alexander; the assassination of Garfield—these are some of the events which will not soon be forgotten, and whose consequences will form the staple of the history of the current year, when it comes to be written for the next volume of the 'Register.' The two most valuable features are the daily Chronicle of events and the Obituaries. In the "Retrospect of Literature, Science, and Art," a summary is attempted for the last two provinces, but literature is treated in detail, with an attempt at independent judgment on each of a certain number of books. The result is certainly anything but a high order of criticism, and we do not see why the summary method is not employed here as in the case of science and art. Some one might be found to do for England and America what the foreign colaborers of the *Athenæum* do annually for their respective countries, in estimating the literary product of the twelvemonth. The appendix gives in parallel columns the text of the Land Bill of 1881 as brought in, and of the Act as passed.

—That a man's portrait can serve to emphasize the oblivion that has overtaken his name and reputation, will be believed by readers of *Le Livre* for July. Champfleury opens the number with a mocking article on the "Forgotten Romantics," taking Siméon Chaumier for his first illustration, in all probability because there was an absurd lithographic likeness of him handy for reproduction. S. Blondel begins a series of articles on the writer's tools, and in the first place concerning the pencil, of which the earliest mention, he says, is in a printed book, 'De Rerum fossilium Figuris,' of the year 1565. Colored crayons we owe to Jacques Conté, a French chemist commissioned by the Revolutionary Committee of Public Safety to supply the loss of the English article when war had interrupted commerce. To this day, however, France has neither plumbago nor cedar-wood for making lead-pencils, and is obliged to import these essential materials. Lamartine, says M. Blondel, always used a pencil in composing, for fluency's sake. Several dozen sharpened pencils lay constantly before him on his desk. In its news department, *Le Livre* tells of the discovery among Thiers's papers of voluminous "Notes," in one parcel, which have all the appearance of being materials for *mémoires intimes*. They will probably be published, despite Mlle. Dosne's repugnance. Further on, we have some distressing details of the plunder and dispersion of Balzac's library and private papers upon the death of his widow. There appears to be some mystery about the fate of Balzac's correspondence with Mme. Hanska before their marriage. Her story that she had burned it is not credited.

—Arsène Houssaye wrote the history of the *Forty-first* chair of the French Academy—of the great rejected who, in his opinion, ought not to

have been rejected ; the outs who were greater than any of the ins ; men who could describe themselves, with sarcastic modesty, as did Piron, "qui ne fut rien, pas même académicien." M. Edmond de Goncourt, the survivor of two brothers who have written much together and written well, but are not members of the Academy, means to go far beyond M. Houssaye in his protest, and to rival Richelieu by founding a new academy. He has made a will by which he creates a society of ten men who are not to be members of the Académie Française. Each academician will receive annually 6,000 francs salary. This is more than the elder Academy pays, but money was worth more when that was founded. Each year the *Académiciens Goncourt* are to meet (a new Council of Ten) to adjudge a prize of 5,000 francs to the best prose work produced in the previous twelve months. The funds for the foundation are to be obtained by the sale of the books and bric-à-brac now contained in M. Goncourt's villa at Auteuil, and so well described in the 'Maison d'un Artiste.' Perhaps the house itself will serve as the headquarters of the Academy. The first members will, it is supposed, be Naturalists, for Goncourt belongs to that school. The next generation will have the amusement of seeing the Naturalism in the new academy gradually yield to whatever is to succeed it in French literature, as Classicism gave way to Romanticism in the Académie Française. It is the indiscretion of M. d'Hervilly, a friend of M. Goncourt, that has revealed this fine project to the public. It is to be hoped that the members-elect, if they know that they are nominated in the will, will not be too impatient for the opportunity of pronouncing their founder's eulogy : also that they and their successors will never give occasion for the writing of a 'Histoire de l'onzième Fauteuil de l'Académie Goncourt.'

—The force of party feeling and political hatred in France is a continual surprise to us Americans, in our present calmness, and is occasionally alarming to those who hope for the quiet success of the French Republic. Yet any American past middle age, who can recollect with what energy of dislike his grandfather pronounced the words "British," "regulars," "red-coats," and how he would inveigh against standing armies and monarchical government, may understand a late scene in the French Chamber of Deputies. A speaker had used the proverb, "Où il n'y a rien le roi perd ses droits." A member of the Extreme Left cried out : "Shall we never get rid of these old formulas ?" and showed that he could not endure the word "king," even so innocently used. It was a trifle; but it is one of many trifles which show an implacable feeling that we may pardon if we remember our pre-bellic anti-slavery days, and the feeling attached to "Copperhead" only twenty years ago.

—The painter Jadin, who died lately, famous for the portraits which he painted of those poodles which Parisian ladies of a certain class have been ill-naturedly said to care more for than for their children, had another claim to be remembered by posterity. He discovered the *Quartier Monceau*. Thirty years ago he bought a large tract of land next to the Parc Monceau for a trifle, established himself there, and made the place known to his friends, and now it is the favorite place of artists and millionaires, much to the advantage of M. Jadin's heirs, for he had found selling land even more fashionable than painting King Charleses.

—The effacement of national peculiarities, alias "unification" of the world, steadily pursues its course. Paris, which has taken from and sent to London innumerable ideas, has at last borrowed the famous Madame Tussaud's wax-work gallery. The judicious Parisian managers have improved upon the English show by adding the journalists—to conciliate the press: Zola is there as large as life and quite as natural. Otherwise the plan of the whole is the same : warriors and statesmen side by side with murderers and forgers, in their very habits as they lived ; for it is the boast of the prospectus that particular attention has been paid to exact imitation of the clothing, one of the surest indications of character. The man who likes "se faire remarquer" has his brilliant necktie; the man of quieter disposition, who shows "qu'il est de son essence de passer inaperçu dans la foule," is indulged in his taste. The necessary knowledge of this important fact has apparently been gained by personal inquiry, if the celebrities have not actually sat for their statues as they sit for their photographs nowadays. It must be an interesting study of contemporary character to visit the Museum, and see how many and who have flaming neckties. The exhibition after all is not more foolish than many others that have drawn crowds in Paris, and perhaps the favor with which it is received means nothing. But some observant Parisians complain that serious drama is less thought of of late years; that the theatrical public goes less and less to judge and more and more to be amused; that many people who once, when the drama was flourishing, would have attended the theatre twice a week, now go only when some play is making a sensation; and as the plays of that kind are kept on the boards a hundred or three or four hundred nights, they can go to such a theatre at least but once a year—whence decay of the love for the drama and decay of the dramatic taste. The same strain was the burden of the London press while "Our Boys" was having its run of a thousand and one nights. In all countries which have any drama worth mentioning the drama is always decaying in the estimation of the lover of the good old times; but it can hardly be doubted that there has been a change in the temper of Parisian audiences since the time when Hazlitt, visiting the theatre in 1824, found "the attention more like that of a learned society to a lecture on some scientific subject than that of a promiscuous crowd collected merely for amusement. There was an unvarying gravity in looks and demeanor, as if every one had an immediate interest in the character of the national poetry, in the purity of the French accent, in the propriety of the declamation, in the conceptions of the actor, and the development of the story." The last interest still remains. Do all of the former?

—The "Report on the Health of Wênchow" for the six months ending September 30, 1881, by Dr. D. J. Macgowan, is egg-full of curious matter. Having, as he ingenuously confesses, but little to say on the official subject of his report, and being apparently an accomplished Sinologue, the author has taken the opportunity to throw together a miscellaneous collection of memoranda concerning some of the prevalent superstitions of the Chinese, which are well worth preserving. Among other things, he has a word to say about "epidemic frenzies"—the popular crazes which at times affect whole communities, and of which the most noted Western example is the witch mania which devastated Europe in the sixteenth and seventeenth centuries. These epidemics appear to be very common in China, the latest conspicuous instance being the terror created in 1876 by the supernatural clipping of queues, which doubtless our readers will remember. It seems that sorcerers are in the habit of scattering charmed bits of paper representing men, which are the means of disseminating evil spirits throughout the community. When one of these spirits enters a house he proceeds to cut off a piece of the queues of the inmates, and the sorcerer, on obtaining possession of this, can evoke at will the soul of its owner, which he is able thereafter to use as a servile demon, while the man dies through the loss of his spirit. The only cure is for the sufferer to cut off an inch or two more of the remainder of his hair and keep it for eighty days soaking in a cesspool, thus severing the mysterious connection between his head and the portion of hair in possession of the sorcerer. For prevention, reliance is placed on amulets and charms, and in 1876 the Governor of Kiangsu issued a proclamation embodying a charm of his own invention, to be posted over the doors of dwellings or to be worn as an amulet. He further recommended an anathema, attributed to Lao-Tsze, the founder of Taoism, which was to be chanted while copying it on yellow paper with the blood of a cock mixed in vermilion, the paper being thereupon burned and the ashes swallowed. Dr. Macgowan assures us that there was scarcely a house-door that was not protected by a charm, and scarcely an individual who did not wear an amulet on cap or sleeve ; but it subsequently appeared that the panic was the work of secret revolutionary societies, whose emissaries found little difficulty in creating a disturbance by clipping off a few queues from the unwary in each large city, and by loudly announcing in places of public resort that they had been treated in the same way. After this, any one who suffered from nightmare, or had an attack of colic, or met with any theft or misfortune, attributed it to the paper men let loose by the sorcerers.

—The first volume of the Scientific Results of the *Vega* Expedition ('*Vega* expeditionens vetenskapliga jakttagelser,' etc.; 8vo, pp. 812, 15 maps and plates ; Stockholm, 1882), edited by Baron Nordenskiöld, is recently received. For so solid a volume it is difficult to do more than indicate the nature of its contents, which, with the exception of Professor Hildebrandsson's contribution, are printed in the Swedish language. Professor Nordenskiöld devotes one hundred and sixty pages to an account of the voyage prepared for Mr. Oscar Dickson and forwarded at intervals during the voyage ; and to a discussion of the feasibility of trade with the icy coasts of the Siberian seas. Almqvist follows with the health record of the party, an account of the provisioning from a hygienic point of view, the mess-bills, and a temperature record for the interior of the ship compared with that of the outer air during the time spent in winter quarters. He also contributes a 'Study of the Chukchi Color Sense,' and a summary of the lichen collections made on the north coast of Siberia. The botanical results are extensive. From Doctor Kjellman we have papers on the seaweeds of the Siberian Sea, on the Phanerogamic flora of the north coast of Siberia, Novaia Zemlia, and Waigatz Island, and of the Asiatic coast of Bering Strait, whence he describes a new primrose (*Primula tschuktschorum Kj.*) and a new rush (*Luzula latifolia*). These are beautifully illustrated, together with two new grasses belonging to the genus *Glyceria*, which are described by J. Lange in a catalogue of the flowering plants prepared by Kjellman and Lundström. Kjellman also contributes an article on the domestic life and habits of the Chukchi, whose language is illustrated by a vocabulary prepared by Lieutenant Nordqvist. The article by Nordenskiöld on the Aurora at the *Vega* winter quarters, illustrated by a fine map, develops that hypothesis of concentric terrestrial aurora-crowns, or "glories" which in a condensed form has been made public in the 'Voy-

age of the *Vega*' and in the columns of *Nature*. It is well understood that this hypothesis is the most important contribution to the study of auroras which has appeared in a number of years. The observations for geographical position obtained by the expedition are discussed by Lindhagen. Highly important in this connection is the discussion (in French) by Dr. Hildebrandsson of the meteorological observations made during the journey and wintering; especially in view of the recent well-deserved impeachment by Woeikoff of the East Siberian isotherms in Wild's great temperature atlas of the Russian Empire. We may be prepared for a flood of light on the reported temperatures of Verkhoyansk when the observatory at the Lena mouth, just established, begins to turn in its records. The volume closes with Dr. Stuxberg's comprehensive article "On the Invertebrate Fauna of the Siberian Sea," illustrated by some beautiful woodcuts and a well-executed map of dredging stations. Among other additions to knowledge, the name *Weyprechtia* is applied to a new genus of amphipods, a well-deserved honor and a name appropriate to one who haunts those icy seas. A list is given of the range in depth on the Siberian and Novaia-Zemlian coasts of the mollusks found semi-fossil on the tundras of the Yenisei. This article is especially full and valuable on the crustacea, and it is to be hoped that it will appear in a language a little more accessible to ordinary naturalists than the Swedish. The magnetic observations are still in process of computation and reduction, and we learn by a letter from Baron Nordenskiöld that Prof. Petterson, the better to elucidate some interesting points in the hydrography (which has been placed in his hands), has this summer undertaken a trip to Spitzbergen for the purpose of testing by experiment some theories which the *Vega* material has suggested. The results will appear in the second volume, next autumn.

LECKY'S HISTORY OF ENGLAND IN THE EIGHTEENTH CENTURY.

A History of England in the Eighteenth Century. By William Edward Hartpole Lecky. Vols. III. and IV. London: Longmans, Green & Co.; New York: D. Appleton & Co. 1882.

Mr. Lecky has mistaken his vocation. He possesses the talents of an essayist. He has, unfortunately, undertaken the duties of an historian, and does not possess the proper qualifications for the due performance of his task.

Historians, indeed, are, we frankly admit, of most different kinds. What we object to in Mr. Lecky is that he is not capable (as far as his writings show) of excelling in any of the various departments of history. He does not pretend to be an investigator, or to explore the eighteenth century in the same way in which Mr. Gardiner is exploring the wide field of the seventeenth century. He hardly makes a show of dealing with any but the patent and well-known facts of his subject. The Annual Register, the speeches and writings of Burke, the letters of Junius, the correspondence of George III. with Lord North, Mr. Bancroft's history, and works of a similar character, Mr. Lecky has read, and read with care, with intelligence, and with insight. But his reading—though far wider than that of the typical "educated gentleman," who is supposed (quite erroneously) to have at his fingers' ends all the common facts of English history—is in kind not unlike the reading of any intelligent student who cares to know what may easily be known about England during the first twenty years of George III.'s reign. We may even doubt whether Mr. Lecky can boast of anything like the special knowledge as to the lives of particular persons and the details of special transactions which gives considerable value to the narrow but very acute speculations of Dilke. This author, who is most unduly despised by Mr. Lecky, investigated certain problems—as, for example, the mystery which hangs over Burke's early career—in the spirit of an acute detective, but he, after all, knew what research meant, and therefore added something to the stock of human knowledge. Mr. Lecky has never realized that history is nothing but the collection of facts and the sifting of evidence.

If Mr. Lecky is not an investigator, neither does he stand high among narrators. His facile and flowing style makes everything that he narrates agreeable reading, but it takes no great acumen to perceive that Mr. Lecky does not possess that rarest of all gifts, the power of telling a complicated story in a lucid and simple manner. No writer will ever achieve this feat who is not endowed with a keen sense of proportion, and with an eye for perceiving how a complicated subject can be simplified by being carefully distributed into its different parts. Of proportion, Mr. Lecky has no perception whatever. His two volumes afford hardly adequate space for telling the story which he has to tell; yet he wastes twenty pages over the letters of Junius. We deliberately use the word "wastes," because Mr. Lecky all but admits that he has nothing new to say with reference to a subject about which it is hardly worth the while of any sensible man to say anything at all. He holds, perhaps with reason, that Francis was the author of the celebrated letters. But in favor of this opinion he produces not a single argument which is not already thoroughly well known to any person who has ever cared to glance at a controversy which is now chiefly interesting because of the number of men of mark who have at one time or another taken sides in it.

There are writers, such as Mr. Froude, who have not the capacity to give an account of complicated events in the form of a clear narrative, but who yet can paint the scenes of the past. Is Mr. Lecky one of these painters? We cannot with truth answer the question in the affirmative. We have read all his volumes with care, but we cannot recall a single description, either of events or of men, which has left any permanent impression on our memory. Mr. Lecky, indeed, makes great and conscientious efforts to present his readers with a fair estimate of the different actors in the drama of English politics. He tells us a great deal about George III., about Chatham, about Lord North, about Wilkes, and about Washington; but when we have heard everything he has to say we remain without any clear, definite notion of the character of the persons whom he means to describe. There is, for example, no topic to which Mr. Lecky devotes more labor than to the attempt to paint and explain the antagonism between Chatham and Burke. He makes a good number of remarks on this subject which may suggest an explanation of the fact that two statesmen who towered above all their contemporaries in genius, who were devoted body and soul to the public service, who were on many points of a mind, and who for many years were engaged on the same side in the same battle against the reactionary Toryism of George III., still could never act together, and clearly looked upon each other with a suspicion amounting at times almost to antipathy. But though Mr. Lecky makes sensible remarks on the relation between Chatham and Burke, he does not make it in the least easier for his readers to realize what was the true character of the two men who, if they could have acted in unison, might, one is sometimes inclined to fancy, have changed the course both of English and of American history. No one, however, can paint what he cannot conceive, and Mr. Lecky, with all his command of language, lacks imagination. He could describe the men of the past if he saw them, but he has not the gift, granted alike to Carlyle, to Froude, and to Macaulay, of seeing the dead as they appeared when alive.

A writer who is neither an investigator, nor a narrator, nor an artist may nevertheless do good work by bringing into view the general aspects—the salient features, so to speak—of a remarkable epoch. This is the service which we had expected from Mr. Lecky. In his 'History of Rationalism' (by far the best book he has produced), and in the two first volumes of the present work, he displays ingenuity, fairness, and freshness of intellect. He is not exactly original, but he is not tied down to old formulas or received opinions. He can look at things for himself, and therefore has more than once proved that he can see matters which have escaped the attention of better-informed but less open-minded inquirers. There was therefore good reason to hope that we should at any rate get from him a fresh view of the reign of George III. In this hope we have been to a great extent disappointed.

What makes it something like a moral obligation on the part of a friendly critic to warn Mr. Lecky of his mistake in attempting a consecutive narrative of the annals of England during the eighteenth century, is the fact that our author's endeavor to achieve what he cannot accomplish all but hinders him from performing the work for which he is, so to speak, created. The last two volumes of Mr. Lecky's book are hardly equal to the first two; they contain nothing so good in its way as his account of Methodism. Nevertheless, like everything he writes, they exhibit to all attentive critics his unmistakable aptitude for the work of historical essay-writing—an aptitude beyond that of any living English writer. His merits are seen far more clearly in the episodes than in the main course of his narrative. Few things are better than his description of the Gordon riots. If he could have expanded the whole into an essay, he would, without doubt, have thrown most interesting light upon three closely-connected topics to which, as it is, he can scarcely do more than casually allude—namely, the fanaticism and ignorance, a century ago, of the English populace; the weakness of the central Government; and the very great risk incurred by the country during the first twenty-five years of George III. of being drawn into a revolutionary crisis like that which overwhelmed France in 1789. The following picture of the great riots is eminently suggestive. The reader who peruses it must remember that whole districts of London were at the moment lurid with the flames of burning chapels and houses, and were resounding with the shouts of a drunken mob.

"Strange to say, in the unmolested parts of the town the ordinary amusements still went on; and Horace Walpole notices that on this dreadful night Lady Ailesbury was at the play in the Haymarket, and that his four nieces were with the Duke of Gloucester at Ranelagh. The night was fortunately very calm, and the sky was clear and glowing with the reflected flames, save where dark volumes of ascending smoke from time to time overspread it. The streets in the quarters where the riot was at its height were thronged with idle spectators—many of them women with infants in their arms—gazing on the scene, and mixing with terror-stricken fugitives who were endeavoring to save some portion of their property. Spectators were, in most places, in little danger, for the rioters were busily engaged, and they might be distinctly seen by the glare of the flames pursuing their work of plunder and demolition, for the most part entirely undisturbed, in the midst of the burning houses. Wraxall went through a great part of the disturbed district on foot, without the smallest hindrance; and he noticed that, as he stood with his companions by the wall of St.

Andrew's church-yard, near the spot where the fiercest conflagration was raging, a watchman with a lantern in his hand passed by, calling the hour as in a time of profound tranquillity" (vol. iii., p. 562).

Change a few names, and the picture of London in 1780 might very well be the picture of Paris in 1789 or in 1791. In each case there is the same mixture of frivolity and of horrors; in each case respectable men stand by and view the violence of the "people" with the calmness of apathy or of sympathy; in each case the mob act with an order and system which seem almost to argue discipline and leadership, while the troops are inactive because their commanders are full of hesitation and of uncertainty. Nor does the likeness between the English riots of 1780 and the Parisian riots of 1789 consist wholly in the superficial and external circumstances of the moment. From the accession of George III. down to the end of the American war there existed among large classes exactly that state of feeling which in modern times we call revolutionary. Junius, Wilkes, Horne Tooke, and a thousand forgotten demagogues and libellers rose to an influence which their class has constantly possessed in France, and has but very rarely possessed in England. Nothing more brutal was ever said, or written, or believed about Marie Antoinette than was said, written, and believed about George's mother. In England, again, as in France, the turbulence of the mob and the insane suspicions of the populace derived half their importance from the fact that men of weight and of worth thought hardly better of the policy of the Court than did the electors who cheered Wilkes because he had libelled the King and the King's Ministers.

If Mr. Lecky had followed out fully the suggestive hints which he lets fall as to the condition of feeling in England, he would have done work of great importance, well worthy of his high talents and of his deserved reputation. As it is, we have a poor history, interspersed with suggestions for more than one admirable essay. In one instance at least Mr. Lecky fairly follows out the true bent of his genius. He gives an account of the war with the American colonies which may rightly be called a first-rate essay on the causes and the character of the revolt by the colonists against Great Britain. That his conclusions are in every respect sound we cannot assert. Their general result may be fairly enough stated in a very few words. The incompetence, the blundering, and the shortsightedness of George and his Ministers, and of the mass of the English people by whom they were supported, do not admit of exaggeration. The high character of certain leaders on the American side—and notably of Washington—becomes the more visible the more closely the details of the struggle for independence are explored. On the other hand, the oppression exercised by England in the colonies was not of the kind which drives men to madness. In the earlier stages of the dispute popular feeling was obviously against a final breach with the mother country; and up to the very end of the contest there was a very large and influential minority throughout the insurgent colonies in favor of England. There is, therefore, on Mr. Lecky's view, no reason to suppose that the attempt to maintain the unbroken unity of the British Empire was in itself destined from the first to failure. An English general of genius—a Wellington or a Clive—might, in his opinion, have given to the policy of George III. at least a temporary success. Mr. Lecky's pages are written in a spirit of the most impartial fairness, and, we may add, of keen sympathy with the results of the Revolution. But to this part of his work we may return.

SEWALL'S DIARY.—II.

Diary of Samuel Sewall, 1674–1729. Vol. III. 1714–1729. Collections of the Massachusetts Historical Society. Vol. vii. Fifth Series. [See *Nation*, Nos. 696, 697, 765, 766.]

We have already remarked that this volume of 'Sewall's Diary' contains very little which is illustrative of times and manners, and scarcely anything of historical value. Especially is the last true, and it is really surprising that a man who held the high office that Sewall did could have kept a regular journal for fifteen years, and yet noted down so few items of public interest in it. It is true it was a commonplace period. That, however, Sewall probably did not realize. Meanwhile questions, such as they were, did arise and occupied men's minds. The Legislature of the Province—composed of genuine Yankees, men "of small fortunes and mean education," to use the language of Shute's memorial to George I. in 1723—this Legislature was engaged in a perpetual warfare on the royal Governor. It was a paper-money period. It was a period of continuous Indian warfare. Of these public issues, and of the actions and utterances of the public men of the day in regard to them, we get from the diary nothing that is valuable, and little that is new.

Neither is it very much better as respects life and manners. In this respect, the third volume gives us nothing which was not to be found in the two already published. The Chief Justice still went on pleasantly noting the exact day in April when by their arrival the "swallows proclaim the spring"; and especially does he record on every Christmas day that no notice whatever is taken of it, but "The Shops were open, and Carts came to town with Wood, Hoop-poles, Hay, &c., as at other times." The question of publicly observing the 25th of December came up, indeed, for the first time in Massachusetts, as we find by the diary, in 1722. It was three days only before Shute, thoroughly worn out by his contest with the Legislature, slipped away without any formal leave-taking and returned to England. On December 19 he took Sewall aside in the Council Chamber and spoke to him about adjourning the General Court over "because of Christmas." As he himself would have said, the Chief Justice was a man "*antiquis moribus, prisca fide.*" The Governor could not have touched him on a tenderer point. Not to observe Christmas had since 1621 been a cardinal point in the Massachusetts creed. Sewall never lost an occasion for calling this to mind. On April 1, 1719, for instance, he characteristically records: "In the morning I dehorted Sam Hirst and Grindal Rawson from playing Idle Tricks because 'twas first of April; they were the greatest fools that did so. New England men came hither to avoid anniversary days, the keeping of them, such as the 25th of Decr. How displeasing must it be to God, the giver of our Time, to keep anniversary days to play the fool with ourselves and others." So now, when Governor Shute suggested the actual recognition of Christmas by an adjournment of the Legislature, the Chief Justice could only say that he "would consider of it." Two days later the suggestion took a formal shape. The Governor absolutely propounded it to the Council. A warm discussion ensued, during which "Col. Taylor spake so loud and boisterously for Adjourning that 'twas hard for any to put in a word." Finally Sewall stood up and declared that "the Dissenters came a great way for their Liberties, and now the Church [the Episcopalians] had theirs; yet they could not be contented except they might Tread all others down." No vote seems to have been taken, but the next day the Governor, who had announced himself as of "the Church of England," took advantage of his prerogative and adjourned the court over to Wednesday, Christmas falling on Tuesday. So on Tuesday the Chief Justice grimly saw fit "to stay at home and not go to Roxbury Lecture," which might have savored of an observance of the day, but instead thereof, "Visited my old friend and carpenter, Peter Weare, but found him gone to heaven."

A few other passages throw curious gleams of light on manners. The following is one of them, the scene being the church in the little village of Rehoboth, on the Rhode Island line, where the Chief Justice was holding court:

"Septr. 9, [1716] Lord's Day, Mr. Greenwood preached very well. Afternoon call'd William Brown and Elizabeth his wife to present themselves. They stood in the Fore-Ally and were admitted, Confessing their Sin of Fornication."

There is another and longer entry, under date of May 14, 1716, which illustrates strikingly the religious severity of the time. Two young merchants, having a ship ready to sail from Portsmouth, set out to go there from Salem one Sunday morning. Sewall was then going the Circuit and chanced to be at Newbury. He says:

"In the evening I had an inkling that two Merchants came from Ipswich. I said, How shall I do to avoid fining them. I examined Richard Gerrish [one of the two]. As I understood him, they lodg'd at Major Epes's on Satterday night, and went to the publick Worship there; and when the Afternoon Exercise was over, came to Newbury. They Travailed not in Service Time: and had a Ship at Portsmouth ready to sail which wanted their Dispatch. . . . I consulted with Col. Thomas, who inclin'd to admonish them as young, and strangers, and let them go.

"Newbury, May 14, 1716.—By long and by late I spake with Mr. Richard Gerrest, jun'r, and Mr. Peter La Blond [the other young merchant], by whom I understand they were at Mr. Wigglesworth in the morning and at Ipswich Meeting in the afternoon. Being in a strait, I had pray'd to God to direct. I considered that Col. Thomas was not a Justice there; that this Profanation of the Sabbath was very great; and the Transgressors fleeting from Town to Town and County to County could rarely be censured. . . . I came to this Resolution, that if they would make such a submission as this I would let them pass, viz.: We do acknowledge our Transgressions of the Law in Travailing upon the Lord's Day, May 13, 1716. And do promise not to offend in the like kind hereafter, as witness our hands.

"Richard Gerrish.
"Peter La Blond.

"This offer they rejected with some Disdain, and Mr. La Blond paid me a 30s. and 10s. Bill of Credit for both their Fines."

Under such circumstances as these it was small matter for surprise that a strong under-current of anti-religious protest existed. It certainly did exist, and sometimes manifested itself in unexpected ways. For instance, on January 8, 1717, the church in question being apparently the Old South, Sewall records:

"'Tis sad it should be so, but a virulent Libel was starch'd on upon the Three Doors of the Meeting House, containing the following Words:

TO ALL TRUE-HEARTED CHRISTIANS.

"Good people, within this House, this very day,
A canting Crew will meet to fast and pray.
Just as the miser fasts with greedy mind, to spare;
So the glutton fasts, to eat a greater share.
But the sower-headed Presbyterians fast to seem more holy,
And their Canting Ministers to punish sinfull foley."

The volume as a whole, however, as we have already said, is a record not of incidents even such as these, but of the grotesque details of the old man's courtings. His first wife died on the 19th of October, 1717—"Whereby," he records, "the Chamber was fill'd with a Flood of Tears. God is teaching me a new Lesson: to live a Widower's Life." The lesson seems to have been very imperfectly learned, for just three months and a half afterward, the old gentleman, being then hard on sixty-six, was already casting amorous eyes on Madam Wait Winthrop, who had been a widow three weeks less time than he

had been a widower, to wit: two months and twenty-seven days. Mrs. Winthrop was then fifty-four. Presently in 1719 he married the widow Tilley, and she suddenly expired, "to our great astonishment, especially mine," on May 26, 1720. On the first day of the following October, being then sixty-eight years and six months old, and just four months a widower, Sewall goes round to see Madam Winthrop, and begins another courtship by telling her: "My loving wife died so soon and suddenly, 'twas hardly convenient for me to think of Marrying again; however I came to this Resolution, that I would not make my Court to any person without first Consulting with her."

This courtship, which never resulted in marriage, was first begun, by the way, in a highly characteristic manner. The Chief Justice thus records it:

"Febr. 3, 2, [1718]. I sent Madam Winthrop, Smoking Flax Inflamed, the Jewish Children of Berlin, and my small vial of Tears, by Mr. Gerrish, with my service: She thanks me, and returns her Service to me."

These were all theological tracts of the time, such as Sewall was in the custom of showering about him on special occasions; but, under the circumstances, "Smoking Flax Inflamed" was certainly a happy selection. Three days later comes the following:

"Febr. 6. This morning wondering in my mind whether to live a Single or a Married Life; I had a sweet and very affectionate Meditation Concerning the Lord Jesus; Nothing was to be objected against his Person, Parentage, Relations, Estate, House, Home! Why did I not resolutely, presently close with him! And I cry'd mightily to God that He would help me so to doe."

It would have been well for Sewall if the help thus "mightily cry'd" for had been vouchsafed to him, for the old man, it would seem, must have turned in his grave, and his ashes cried out against the vandal-like desecration which was wrought, when, a century and a half later, every ludicrous detail of what afterwards took place was set forth in print:

> "Proclaim the faults he would not show;
> Break lock and seal; betray the trust;
> Keep nothing sacred; 'tis but just
> The many-headed beast should know."

Into the details of Chief Justice Sewall's numerous courtships in his old age we do not, for reasons already given, propose to enter. They are certainly graphic and entertaining enough, and they are now common property; but they were not written to be printed, and his descendants never should have allowed them to pass out of their possession. The thing has been done, however, and the poor old man stands before posterity in a way no other man ever stood. The picture, however entertaining, is not a pleasant one, and we shall not reproduce it. Those who wish to study it can do so by consulting the volume before us, more especially between pages 262 and 276.

RECENT BOOKS ON THE AZORES.

THE literature relating to the Azores is so very scanty—having been comprised until lately, so far as the English language is concerned, in three or four books and a few magazine articles—that the simultaneous addition to it of two readable works, within a month, is certainly a fact worth noting. It is fortunate that these two are so essentially different as to help rather than hinder each other. One is by a shrewd journalist, the other by a keen-eyed woman. The lady's book is unquestionably the better of the two—better planned, embracing better material, and better handled; it is also better printed, and more attractive to the eye; and, although the book of her male rival is illustrated (as we are twice informed on the cover), yet the illustrations are so cheap and poor as to add little to its value. But both works have their merits, and either will inspire a wish to make personal acquaintance with the quaint, unchanging, semi-tropical, half-Moorish "Western Islands," or Azores.

Mr. Lyman H. Weeks's 'Among the Azores' (Boston: J. R. Osgood & Co.) appeared originally in the form of letters to the Boston *Traveller* and *Herald* and other journals. In his capacity of reporter, Mr. Weeks has visited the smaller islands of the group as well as the larger, and has well portrayed their narrow and weary stagnation of existence—a thing picturesque and even fascinating for a few days to the untravelled American, and after that time inexpressibly wearisome. The author is also a botanist, or his Azorean life has made him such, and he gives us the scientific names, and sometimes the descriptions, of the beautiful ferns which are the glory of the wild Azorean flora; and he also depicts with some minuteness the world-famous gardens of San Miguel. All that can be done by English gardeners, transferred to a semi-tropical climate and furnished with almost unlimited means, has been done at Ponta Delgada. Shrubs, trees, and herbaceous plants have been imported from Africa, Asia, Australia, and America: it is what might be called, in the modern phrase, cosmic horticulture. There are ferns twenty feet high growing in grottos; there are a hundred varieties of camellia in a single garden; there is the beautiful Norfolk Island pine; the traveller's-tree from Madagascar; the Australian *Banksia*, lifting its heads of red and yellow flowers fifty feet in air. The garden of Senhor de Canto exhibits two hundred and fifty varieties of magnolia, and more than four thousand very rare exotics. Kew Gardens, in England, do not at all equal these more southern paradises; and one looks beyond them all, it must be remembered, upon the glorious background of the ocean. Mr. Weeks has a keen eye, not for flowers alone, but for local habits and traditions; but either he or his proof-readers must be sometimes careless about their Portuguese, or they would not give us *fas favour* for *faça favor* (p. 104), and *carapuca* for *carapuça* (p. 143)—this being the name for the curious horned hat of the San Miguel peasants. The author neglects his accents, too, and his José becomes almost always Jose. One of the best passages in the book is the sketch of an Azorean post-office, with the long and patient waiting of the people, and the extraordinary arrangement of the letters. It takes nearly all day to distribute the mail, however small, and the final delivery is thus effected:

"First the mail for the Custom-house, the civic governor, the military commandant, the captain of the post, and other important functionaries is handed, in neatly arranged packages, to messengers in waiting. The rest of the mail is arranged in alphabetical order, not, however, by the family, but by the baptismal names. Under A come all the Antonios, under J the Josés, and so on. Commencing with A, the clerk begins to read, in a slow, monotonous tone, all the addresses in regular order, something like this: 'Antonio Joaquim, Antonio José de Silva, Antonio Ignatio Roderigues, Affonso Lecpoldine de Almeida, Affonso Constantina Seza de Freitas.' A is always a long list, for the Antonios are numerous; F is large, for there are the Franciscos; J has a lengthy roll of Josés and Joãos; and M contains the Manuels and Miguels. The other letters of the alphabet are less fruitful, but if you happen to be so unfortunate as to be called Zachariah, Zebediah, or some kindred name, the tantalization will be perfect.

"Standing in this steaming, smoking, sweltering, jostling crowd during all this alphabetical harangue is not conducive to good humor, or to an admiration of Portuguese official methods; but habitués soon become marvellously proficient in calculating when their letter is to be called. When the office is first opened, only the A's fill the room; presently these begin to fall out, and the others take their places, until shortly the A's are all gone and the F's are in the majority; these in turn give way to the J's, who have been gradually dropping in, and who by and by yield to the M's; and so the work proceeds until the whole mail has been read over" (pp. 103–4).

Miss C. Alice Baker's 'A Summer in the Azores, with a Glimpse of Madeira' (Boston: Lee & Shepard) is a book of more delicate literary execution than that just described. Miss Baker is an eminent teacher, well known also for her lectures on American history; yet her little book is never oppressively didactic, and she has the activity and eager spirits which are said to characterize those of her profession when on a vacation trip. Her descriptions of Fayal, which is the Azorean island mainly interesting to Americans, are far more ample and satisfactory than those of Mr. Weeks; and this not so much from greater opportunities as from a better observing faculty. Each of them, for instance, spent a day in making the excursion to the *Caldeira*, or crater, in the centre of the island, but Miss Baker makes twice as much of it. Her delineations of street-life in Horta, the capital of Fayal, are by far the best, and it is the same with peasant life; and she gives rather more detailed information as to ways of living and prices of labor—points of some interest where the best dressmakers earn but twelve cents a day, and milk-maids eight cents (p. 60). It must be said, however, that neither writer adds anything to our knowledge of the curious inscriptions, in an alphabet not yet identified, which are to be found in some of the rural churches on the island of Fayal.

One of the most unquestionable traits in Miss Baker is a very uncommon talent for telling a story. We have rarely read anything in its way better than her narrative, as taken down from a sailor's lips, of the rescue of Boyle O'Reilly from Australia. Every touch tells, and not a word is wasted. We have no room to quote it (pp. 17–23), nor even to give the tale of the sea-captain's wife who saved her husband's life with warm plates (pp. 170–1), but we must spare space for an anecdote and a description. The anecdote is of the wife of a whaling-captain, who put in at Fayal and was the guest of the ever-hospitable American consul, Mr. Dabney. The Consul's wife, seeing the good woman sitting bolt upright for a long time in a straight-backed chair, kindly urged her to lie down upon a couch and rest. "No, I thank you," was the reply. "I've been a layin' for six months, and I think I'd rather set a spell" (p. 172). This may serve as a companion-picture to that of the monk in 'Hypatia,' who, after a week's boat-journey on the Nile, declines the primate's invitation to take a chair at Alexandria, and prefers to remain standing, inasmuch as "of sitting, as of all carnal pleasures, cometh satiety at the last." As to the description which we propose to quote from Miss Baker's book, it relates to an extraordinary mode of "coasting," or sliding down hill, which prevails in the excessively steep streets of Madeira:

"The sled holds two people, and is like the *carro* [sledge] cut in halves—a wicker body on low wooden runners, projecting a little, and rounded at both ends, to prevent accident. Two men guide each sled. A stout rope extends from the point of each runner to the hand of the guide on either side.

"The steep street, which is paved with small beach-stones set on their edges, and is worn flat and polished by the constant passage of *carro* and sled, is unusually slippery to-day after the rain. The men dare not give the sled her head. It is very dangerous. With one hand firmly on the back of the sled, the other grasping the rope, they plant their bare feet squarely on the smooth pavement, and brace back with all their strength. Their pose and action are superb. One man falls, and is dragged some distance, but manfully clings to the rope, and keeps us in the track. We go very slowly, but to us novices it seems quite

fast enough. We coast under trellises arching from wall to wall, between which the road winds. Some of these trellises are covered with great masses of bougainvillia in full bloom; others bear squash-vines with immense squashes supported by straps. Lower down, men are picking huge clusters of purple and white grapes, and drop them down into the sledge for us to eat as we go.

"At last we reach the rain-level; the guides put on their shoes, and then the fearful race begins. Running a little way, till the sled acquires a momentum, the guides then jump upon the hind-ends of the runners, where they stand on one foot, guiding the sled by the ropes and the free foot. There are four sleds. The runners of those ahead of us smoke, and smell of burning wood. We hold our breath, and, frightened, clutch each other's hands. Our speed is terrific. To our horror, we in the last sled, being a little behind the rest, see a lady on horseback slowly advancing up the hill. It seems impossible for us to pass her safely, even if she hugs the wall and her horse be quiet. It takes but an instant to see that he is not quiet, and that the approaching sled terrifies him. In an instant a lifetime is lived. There is a dreadful vision of three women killed or mangled; one, still more to be pitied, spared to tell the tale at home. Just as we reach them, the horse pulls away from his leader, turns his nose to the wall, his hind-quarters to the sled. We cower, throw ourselves far over to the other track. She and we are safe! Not a shriek nor a word has escaped any of us, but the two in the sled are faint and exhausted from the impending peril. A few more dizzy zigzags, and we are at the bottom. Fifteen minutes' coasting, including one or two stops, has accomplished what we were two hours and a half doing on horseback" (pp. 161–3).

Bright Days in the Old Plantation Time. By Mary Ross Banks. Illustrated by James H. Moser. Boston: Lee & Shepard.

THIS volume purports to be a narrative of the adventures of a little girl on a Southern plantation before the war. The conception is excellent, but it is loosely carried out. The self-consciousness of the author leads to a painful elaboration of details that are trifling and unimportant. The interest centres in the contrast between the little girl and the house-servant, a negro woman named Bet. Whenever these two are brought together the general looseness of style and intention disappears, and we are presented with a very vivid picture of the relations that existed between the negroes and the children of their masters. That there is a reasonable basis for such a picture is a tribute, not to slavery or to any of its results, but to the character of the negroes themselves. From every part of the South comes testimony to the effect that the faithfulness of the colored people to the families of their masters was based, not upon ignorance and thoughtlessness, but upon an affection more remarkable than any that has hitherto been chronicled in history or romance. There are occasional touches of character-drawing here and there in the book that are exceedingly vigorous; indeed, in contrast to the inconsequence by which they are surrounded, they are surprisingly vivid.

Perhaps it would be well to take the negro dialect on trust. Occasionally it is strikingly written, but it is not systematic. The lapses, occurring always at a critical moment, are characterized by an almost entire absence of that happy assimilation of thought and word, idea and expression, which is the secret of all dialect-writing. The negro dialect is something more than a mere jumble of curiously-spelled words. It is full of humor, and of that humble impulsiveness which has been so grossly misunderstood and misrepresented by the great majority of those who have attempted to convey the negro character into literature. Moreover, the dialect has a tone of its own: its words, its expressions, or its humor may vary with individuals, but its tone remains the same. It is the same in the dialect of the Atlantic coast and Sea Islands as in the dialect of the cotton and tobacco plantations: the methods are different, but the tone—the spirit—remains identical. Is it likely that a negro woman on a plantation, before the war, would have said: "I wan' ter 'gin de prepperashuns fur de 'tainment"? Is it likely that the leader of ceremonies at a plantation corn-shucking, before the war, would have exclaimed: "Come, boys, le's sing sumpin' suiterble ter de 'cashun. You'z all got on too much steam. Le's blow our whissels, er some our b'ilers mought bust"? It is possible, of course, that such expressions might have been used; but are they characteristic, are they typical? The fact that the ideas conveyed are sometimes in contrast with the words employed, gives to some of the negro talk a curious and not uninteresting flavor of the cracker dialect reproduced by such writers as Longstreet, Thompson, and Baldwin. Of the songs given, "'Way in de Kingdom" is one of the most characteristic spirituals we have ever seen. A play-song, "I'z in dis lady's gyardin," lacks the refrain-chorus of "Hol' de keys, ladies, hol' de keys." But has this song a negro origin? If so, how about

> "Come under, come under,
> My honey, my love, my own true love,
> My heart's been a-weeping
> This long time for thee"?

Even on the Sea Islands, where contact between the two races has been comparatively limited, the negroes have borrowed a number of folk-songs from the whites. They have also appropriated many of the signs and omens that belong to the lore of the whites.

Mrs. Banks has missed writing an important book not because her style is crude and her methods inartistic, but because she has failed to avail herself of the vast mass of material lying, so to speak, at her elbow.

The Boundary Disputes of Connecticut. By Clarence Winthrop Bowen. "Sunt certi denique fines, Quos ultra citraque nequit consistere rectum." Boston: Jas. R. Osgood & Co. 1882. 4to, pp. 90. Portrait and 17 maps.

THE god Terminus seems to have wreaked a cruel vengeance upon the Puritan commonwealth which had despised his authority and dispensed with his services. He hopelessly confounded "the ancient landmarks which the fathers had set"; so that from the building of the first house in Connecticut, in 1633, it was two hundred and forty-seven years before any one could positively lay down the boundaries of colony or State. The story of this long uncertainty, of the diplomatic negotiations, the controversies in the royal courts, the violent assertions of jurisdiction on the one hand, and the violent resistance to it on the other, is the subject of Mr. Bowen's superb volume. He has rendered a substantial service by the laborious thoroughness with which he has explored not only the very numerous publications which constitute the existing library of Connecticut's history, but also the inedited original documents of that history. These sources are faithfully indicated in abundant foot-notes; and many of them are reproduced for the first time in the form of several of the maps with which the book is so amply illustrated. By these helps, not less than by the text, it is made easy to see how the eccentric zigzag which deforms the western boundary at its southern end, and how the two strange notches which break the northern boundary near the middle came to be the outline of the State. The means by which Long Island, and almost all that was not mainland, although once belonging to Connecticut, was wrested from it, so that now the State is bounded on the south, and almost, for a little distance, on the east, by New York, is also made plain. And it will not be remarkable if Mr. Bowen's condensed and unpretentious narrative shall leave upon any mind the impression that the little colony and State suffered the usual fate of the weaker in its controversies with New York and Massachusetts, and only got its rights when it had to do with a still weaker power that adjoined it on the east.

It must be added, however, in fairness, that the book is so good that it ought to be better. Its utility would have been none the less if, to the publisher's splendid letter-press and lavish illustrations, the author had contributed the graces of a literary elegance which perhaps may come to him with years and experience. "The Mohegan lands, which included the old Pequot country and (dependent upon which by right of conquest) the Wabbaquassett or Nipmuck country" (p. 25), is a startling bit of rhetoric. One is puzzled to know how Long Island (which is some twenty miles wide) could ever have been "the southern boundary" of Connecticut (p. 28); and yet the writer means that the Island was part of the colony. "This claim . . . was called by Rhode Island 'a legalized robbery,' and had been 'procured by an underhand dealing'" (p. 34); although the author only means to state the Rhode Islander's complaint. It is an odd anachronism to speak of the Province of Massachusetts and the Colony of Connecticut, in the seventeenth century, as "States" (pp. 36, 38, 61, 72). It was not in 1637 (p. 15), but on the 15th of April, 1638, that the settlement at New Haven began.

It would have been quite germane to the subject of Mr. Bowen's book if he had given a reasonably full account of the proceedings, in a Federal court specially constituted for the purpose, by which the Connecticut claim to jurisdiction over the northern part of Pennsylvania was finally terminated. The curious story of that claim, arising out of a grant running west to the Pacific Ocean, under which delegates used to be sent from Pennsylvania to the Connecticut General Assembly, is disposed of here in a few lines. But the volume partakes so much, in the splendor with which it is offered to the public, of the character of a gift, that the popular adage upon that subject may well preclude unfavorable criticism.

From Sword to Share; or, A Fortune in Five Years at Hawaii. By Capt. H. Whalley Nicholson. London: W. H. Allen & Co. 12mo, pp. xix.–348.

CAPTAIN NICHOLSON is an English Army officer, who has recently spent a year or so in the Hawaiian Islands, and who undertakes to show how a comfortable fortune may be made in five years on an investment of £1,500 in the sugar culture. His own abandonment of the "sword" for the "share" was quite too brief for any such desirable result in his own case; but as this circumstance is not made evident in his very readable but misleading book, we shall be able to render a cautionary service by revising his estimates.

'From Sword to Share' is intended to prove the following proposition: that any intelligent and active person who will start for Honolulu with the £1,500 in his pocket, and who will raise four crops of sugar, beginning with fifty acres on rent at half shares of the produce, and adding fifty acres annually to his farm, will at the end of that time have £7,750 clear profits, in addition to his plant (£650) and maintenance (£600) for five years on the plantation. We give an abstract of the figures by which this desirable result is made to appear: During the first fifteen months of residence the whole capital of £1,500 is invested in travelling expenses, implements, buildings, wages, and maintenance. The profits then come in on paper as follows:

First crop.—Half share of produce from 50 acres plant canes, at 3 tons per acre (net price in San Francisco, £1,650). Net profit	£150
Second crop.—50 acres rattoon canes, 50 acres plant canes. Net profit	1,350
Third crop.—100 acres plant cane, 50 acres rattoons. Net profit	2,500
Fourth crop.—100 acres plant, 100 rattoons. Net profit	3,750
Total profit over and above maintenance	£7,750

This sum includes the cost of the plant (houses, implements, etc.) referred to above. What the fortune of the sugar-grower would be after ten or twenty years' residence is left to the imagination.

The above estimate is a very alluring one, and it has a definiteness which will very likely tempt half-pay officers and others to follow Captain Nicholson's advice. While wishing them all success, we must make two corrections of the first importance in his estimates. And first, Captain Nicholson estimates that the rattoon-cane, or that which grows spontaneously during the second year from the roots of the cut plant-cane, will yield as heavy a crop as the latter. The fact is, that it cannot be depended upon to yield more than a half crop. This error is one which could not have been committed by a planter, and it makes our author's estimate of profits about thirty per cent. too high, even on theory. Captain Nicholson's second error is equally unpractical: he overlooks entirely the actual results of the Hawaiian planter's experience up to the present time. Substantially, they are as follows: There are now at the Islands fifty-one plantations owning their own mills, and twenty-two planters who own no mills, but send out their crop to be ground. A considerable number of both these classes of planters are in a fair way to make money, but only a few have made money as yet. The great majority of the planters on shares, so far from getting back their investment from the first crop, are still in debt. Of the whole number of plantations, not more than ten are yet unembarrassed and in a paying condition; and not one has ever borne out, thus far, the glowing estimates of Captain Nicholson. But, on the other hand, there can be little doubt that the investment of a moderate capital in Hawaiian sugar-planting by a person who has a knowledge of the business, and the energy to supervise its practical details, offers at the present moment (thanks to the Hawaiian Treaty) a favorable opportunity of profit. The amount of sugar exported from the Islands is still small, and it finds a ready market in San Francisco. The yield per acre (three to six, or even, in favored localities, seven tons) exceeds that of any other sugar-growing country; and the improved processes of irrigation now in use have removed the chief source of detriment to the Hawaiian sugar-crops, that of drought. We do not know how many soldiers the author's country might spare at present, but it is safe to say that a considerable number of energetic persons might venture the change from shop to "share" in Hawaii with a fair chance of success.

BOOKS OF THE WEEK.

Abel, C. Linguistic Essays. Boston: Houghton, Mifflin & Co.

Allen, J. W., jr. Paul Dreifuss: His Holiday Abroad. Boston: Geo. H. Ellis. $1.

The Nation.

NEW YORK, THURSDAY, AUGUST 10, 1882.

The Week.

CONGRESS had nothing to do with the motives that may have prompted President Arthur to veto the River and Harbor Bill. The veto was called for by the public interest, and was a patriotic and meritorious act in itself. The reasons upon which it was based were unanswerable. The President showed conclusively that some of the appropriations went beyond the constitutional powers of Congress, and that many involved a reckless waste of money. No appropriation bill ever was more wanton in its lavishness. No veto message ever was clearer and more irrefutable in point of argument. None has ever appealed more directly to the constitutional conscience as well as to the moral sense of members of Congress. In the face of all this, both Houses voted down the veto by majorities exceeding the required two-thirds. Democratic papers say that the Republicans have a majority in Congress, and are therefore responsible for all that is done. Republican papers say that the Democrats furnished the votes that made the two-thirds possible, and that many of the most extravagant and objectionable appropriations in the bill were moved and put in by Democrats. It is high time for the taxpayer who has to foot the bills, and the good citizen who does not want this Government to become a mere machinery of plunder and a sink of corruption, to look at this thing carefully and impartially.

Among those who voted to pass the River and Harbor Bill over the President's veto there were in the House of Representatives sixty-five Republicans, fifty-one Democrats, two Independent Democrats, and four Greenbackers. Of those who sustained the veto in the House, thirty were Republicans, twenty-four Democrats, and one a Republican Greenbacker. In the Senate there were eighteen Republicans and twenty-three Democrats against the veto, and twelve Republicans, three Democrats, and one Independent in favor of sustaining it, and saving the public money. In both Houses there was much lively and skilful "pairing" between Republicans and Democrats, all calculated to help the opponents of the veto. It appears, therefore, that as to this vote, by which eighteen millions are taken out of the Treasury, about six of which can be usefully expended, while the rest may be classed as a profligate waste of public money, the honors between the two parties are perfectly easy. Democrats and Republicans will lustily abuse one another when the question is which party shall have the offices. They fight one another tooth and nail on the stump and at the polls. But when it comes to draining the Treasury, a large majority of the chosen men of one party will harmoniously coöperate with a majority of the other like a band of brothers. They fight for the first seats at the table and embrace in the gutter.

It would not be surprising if an outside observer should make a mistake in a comparative estimate of the amounts of the various appropriation bills, considering the procrastination, slovenliness, and final haste which mark the passage of these measures. But when two members of Congress differ nearly $30,000,000 in their statement of the total, one or the other is convicted of gross ignorance of a subject with which he ought to be familiar. On Saturday Senator Allison, of Iowa, said the sum appropriated this year was $294,243,097 36, an increase over last year of $77,500,000. Representative Hiscock of New York said on the same day that the total was $265,469,000, and the increase $48,297,000. Here is a disagreement, in precise figures, of $29,203,000 as to the annual growth of Congressional extravagance. Either comparison is sufficiently shameful, but when members do not know even how much money is wasted, the waste is partly explained by the incapacity or negligence of those whose duty it is to prevent it. There is a like variance as to details—Mr. Allison putting the increased payments for pensions at $47,719,693, and Mr. Hiscock at $34,000,000 — a difference of $13,719,693. The disagreement as to the total may be accounted for in part by the fact that Mr. Hiscock included in his estimate only the regular appropriation bills, while Mr. Allison added the amount, more than $24,000,000, embraced in other bills authorizing expenditure of money—as it was entirely proper for him to do in a financial comparison, because, whatever the bill may be called, the draft upon the Treasury is the same. But even upon this theory there is still a difference of $4,634,225 70—Mr. Allison making the total of the regular bills $270,103,225 70, and Mr. Hiscock making it $265,469,000. As to pensions, while nobody has been able to tell precisely what expenditure the reckless Arrearages Act will in the end involve, it ought to be easy to ascertain what sums are appropriated under it from year to year. Yet the Iowa Senator and the New York Representative are nearly fourteen millions apart. Another member, Representative Atkins, of Tennessee, agreed with neither of the others, but said that the total excess for the year was $78,247,000.

Mr. D. B. Henderson, Secretary of the Republican Congressional Committee, denies indignantly that women in the Federal service have been subjected to political assessments. "Nowhere in the United States," he says, "has any woman or child been asked to contribute." Mr. Henderson's warmth in this matter is rather surprising. Upon Assessor Hubbell's theory—that the officeholders who secured their offices through the supremacy of the Republican party ought to pay a part of their salary to maintain that supremacy—why should not a woman or a child who has an office pay for it as well as a man? But Mr. Henderson is making a distinction without a perceptible difference. The Hubbell assessment really falls upon those whose means of support are diminished by it. If a clerk with a small salary and a large family is required to give two per cent. of his pay to the Congressional Committee, his wife and children certainly do contribute in a substantial way.

The *Times*, it seems, was wrong in saying that "A. Thomas," to whom Mr. Folger wrote so thoughtfully on the subject of "voluntary" assessments, was a myth. It appears from the Congressional Directory that Alfred Thomas, of the Miscellaneous Division in the Second Comptroller's Office, is the person who was longing so earnestly to contribute to Mr. Hubbell's fund, and inquired of the Secretary whether he might do it safely. This lends a human interest to the correspondence which it would otherwise lack. What a relief it must have been to Alfred and his fellow clerks, and what joy must have spread throughout the Miscellaneous Division when the news came that they might after all contribute!

The meeting of the National Civil-Service Reform League, which took place on Wednesday at Newport, listened to a very eloquent and pointed address from Mr. George W. Curtis, and adopted some resolutions which, if vigorously acted upon, will exercise an important influence on the elections in several Congressional districts. Mr. Curtis pointed out that while the President had given the subject of civil-service reform at least a respectful discussion in his message, and "urgently" asked for the appropriation of $25,000 for a Civil-Service Commission, and while a committee of the Senate had instituted some serious and valuable inquiries into the comparative workings of the old and the reformed systems, and favorably reported to the Senate two bills embodying schemes of practical reform, the House of Representatives treated the matter with the most demonstrative contempt, at first refusing even to pass the appropriation asked for by the President, and finally passing it only at a reduced figure, amid jeers and jibes. From the whole attitude of the House it is evident that, as long as that body is composed of the same elements as now, no practical measure of legislation in any important degree changing our civil-service system is to be hoped for. It was in view of this fact, as well as of the general recklessness which of late has developed itself again in the use of the patronage, the conduct of our legislators, and the management of the party machinery, that the meeting thought it timely to recommend to the civil-service reform associations in the different parts of the country a more active participation in political movements than they have hitherto ventured upon. They are asked in the first place to interrogate the candidates for Congress nominated by the political parties about their views and conceptions of duty concerning definite measures of legislation necessary for the reform of the civil service, and then to urge the friends of the cause to vote only for such candidates as give satisfactory guarantees in that respect.

And in case the candidate of neither party gives such satisfactory guarantee, then the friends of civil-service reform are called upon, wherever practicable, to put in the field candidates of their own.

The hard-headed men of Maine will scarcely accept as conclusive Mr. Blaine's hasty treatment of the shipping question in his campaign letter published lately. He says that those who favor the admission of "foreign-built ships to American registry" desire to "break down what they call the odious monopoly of the coasting-trade." The friends of free ships do not propose to interfere with the coasting trade at all. Every measure introduced into Congress to enable Americans to buy vessels where they are cheapest, in order to compete for a share of foreign traffic, has contained a provision that the European-built vessels shall not be used in the coasting-trade. This is not the first time that Mr. Blaine has seemed to forget that the people of his State read the newspapers. While he assumes that such a measure would be injurious to the wooden ship-building of Maine, he does not say that the builders of that State are not perfectly able, as we believe they are, to compete with those of any country in constructing vessels of that kind, and therefore need no protection. He mentions the gratifying fact that by the end of 1882 they will have launched "as large a number of wooden sailing ships" as they ever did in a single year, but he does not add, what ought to occur to the builders, that but for the high tariff, which he holds to be an indispensable condition of prosperity, many of the materials which are used in a ship would be so much cheaper that the profits of the yards would be greatly increased. Mr. Blaine admits that the carrying-trade has been largely transferred to iron steamships, but he does not go on to say that owing to our inability to build these vessels as cheaply as they are built in Europe, and the absolute prohibition of their purchase there, we do not have them at all, and our share of the foreign carrying-trade has consequently shrunk from 75.5 per cent. in 1855 to 16.2 per cent. in 1881. It will be surprising if the men of Maine and other States do not finish for themselves Mr. Blaine's incomplete story.

Mr. Blaine, aside from instructing his constituents on the tariff, wants the American people to take the following view of coming political campaigns: "Personal discussion of candidates, in the presence of really important issues, sinks below the notice of the intelligent voter." Mr. Blaine was never more mistaken in his life. We have no doubt that he himself, as a matter of personal convenience, would like the intelligent voter to abstain from examining the character and record and general fitness of candidates. But never within the memory of this generation has the intelligent voter seen more reason and been more inclined to scrutinize the personality of the candidate closely. And the more intelligent the voter is, the more keenly and searchingly he will look at his man. If Mr. Blaine wants to satisfy himself of this, let him, for instance, run for the Presidency himself.

The Tariff Commission on Wednesday gave audience to a manufacturer of bicycles, who complained that by reason of the duty on steel he was put at a disadvantage amounting to $13 50 on each bicycle in competition with the pauper bicycle of Europe. It was suggested to him by the representative of the iron and steel interest on the Commission that an increase of the duty on bicycles would fit his case. He replied that it was not the home market which he had in view—American manufacturers controlled the American trade now—but he wished to have a fair chance to sell in foreign markets. Brazil, for instance, imported bicycles largely, and American makers could sell in that market as cheaply as English if they could get their raw materials on the same terms. If there is any "infant industry" in the United States, it must be the bicycle industry. If there is any which needs protection, it must be that. Yet it appears that the only thing it asks of the Government is to be let alone and permitted to make its own way, being neither helped nor hindered by the tariff. This was a very unreasonable position for an infant to take, and we do not wonder, therefore, that the suggestion was made to the bicycle manufacturer that his proper course was to insist on "drawbacks"—that is, to demand $13 50 cash from the Treasury for every bicycle exported. The poor man thought that such a step would be attended with embarrassment and uncertainty. And here, as the French say, "the incident terminated." The Tariff Commission, on the whole, is shedding considerable light on a dark subject. We trust it will go on in a spirit of frankness, and elicit as many facts as possible. The public will be able to draw their own conclusions from them.

One of the questions with which the Tariff Commission should be prepared to grapple is this: Is hay a "manufactured" or "unmanufactured" article? The natural answer would be that it is unmanufactured. To be sure it is "cured," but only by lying in the sun, just as corn ripens by standing there. If hay is not an unmanufactured article, neither is wheat. The United States Circuit Court in New York gave this rather obvious answer to the question, but it does not satisfy Senators Frye and Hale, of Maine. A very fine crop has been gathered in that State, but that of New Brunswick is also "equal to any ever grown in the Province." The New Brunswickers will as usual have more hay than they want, and will send some to the United States and so compete in the market with the haymakers of Maine. The duty on hay was twenty per cent. ad valorem until last March, when the Court decided that it could be entered at ten per cent. as an "unmanufactured" article. The Senators regard this as clearly wrong, and appeal from the Circuit Judge to the Tariff Commission. They do not specify the peculiarities of hay which distinguish it as a "manufactured" article, but they do say that one of the duties of the Commission is "the correction of such errors as this," and they predict the certain restoration of the twenty per cent. duty at the next session of Congress. The bill for the relief of the Maine haymakers ought to be preceded by a preamble briefly showing how hay is "manufactured."

The Star-route defence came to a sudden end on Monday, the defendants' lawyers announcing that they had no more testimony to put in. Whether the jury will find any of them guilty or not, it is of course impossible to tell; but the failure of Brady to take the stand is, morally, a confession of guilt on his part. After Walsh had testified to Brady's admission that he levied a regular tax on all the contractors, it would have been out of the question for an honest man to avoid taking the stand to defend his reputation. Brady's silence is the same thing as saying that he dares not expose himself to cross-examination. At the beginning of the trial his eagerness to vindicate his reputation was very marked. Now that his opportunity has come, he is as dumb as an oyster; which is exactly what might have been expected.

The great Tilden income-tax case seems to be at length in a fair way of being brought to an end. The suit was begun against Mr. Tilden while he was running as a candidate for the Presidency, and it has therefore been going on for some six years. His counsel have delayed it whenever they had any opportunity, and when they have not done so, the Government has, until the suit has become a puzzle to most people. Mr. Edwards Pierrepont, special counsel for the Government, seems to have come to the conclusion that the Government has no case, and the Secretary of the Treasury and the Attorney-General have agreed upon the following as the rule of conduct appropriate to the occasion (it appears in a letter on the subject, written last May by Mr. Folger to the Commissioner of Internal Revenue): "It is due to the citizen that he be brought to trial, or that he be freed from the expectation of it, and if there is not enough in the facts to refuse him the latter, it does not seem to me just or worthy of the Government that it exact or take from him a price for the privilege." In other words, if the Government has no case, it should not insist on the payment of costs by the defendant as the price of its being discontinued. The counsel for the Government here has been instructed to act in accordance with that principle. But six years really seems a long period to have been occupied in arriving at this conclusion.

The appointment of Mr. W. W. Astor to be Minister at Rome, in place of the late George P. Marsh, is from any point of view an unfortunate one. Mr. Marsh was a man of great distinction as a scholar and had long diplomatic experience. Mr. Astor is a young man whose experience is not more than sufficient to qualify him for the position of attaché or, at best, secretary on a foreign mission. He has no distinction except that of being a member of a very rich family, and in politics he is chiefly known as having so dissatisfied the voters of his district by his obedience to "Machine" rule that his running for Con-

gress resulted in the election of a Democrat. What makes the matter worse is that this is the reason why he is appointed; it is a "Machine" appointment, to reward him for defying public opinion in the interests of the "Machine."

The call for a State Convention issued by the Republican Committee on Wednesday is of the stereotyped form. "The Republicans of the State of New York are requested to send delegates" to Saratoga on the 20th of September. There is no broad or precise definition of the class of voters who are summoned. Who, for example, are "the Republicans" in this city to whom the invitation is extended? Are they the comparatively few members of the Assembly District Associations, or all the members of the party who elect the ticket, when it is elected? If the business is managed this year as it has been in other years, nobody will be allowed to vote for delegates to the Convention who is not a member of one of these associations. It is very hard to get into these societies—that is, hard for Republicans who are not the followers of a boss, who profess individual convictions and reserve any right of independent action. It is very easy to get out of the societies. Let a member put himself in opposition to the boss, or even take a critical attitude toward him, let him show any independence whatever, and he will be expelled. It is, therefore, a very difficult matter for Republicans who vote for the party's candidates to get a chance to vote for the delegates who nominate the candidates. For most of them it is impossible, and not more than one in ten is allowed to vote for these delegates. Herein consists the viciousness of the present organization, and, so far as this city is concerned, the State Convention can be described as representative only by an abuse of words. The Committee unanimously and with applause resolved to pay the expenses of the indicted and convicted political assessor, General N. M. Curtis, and the fine imposed upon him.

It was reported before the Indiana Democrats met in State Convention that they were greatly troubled by the "whiskey question." It comes up now, not in the form of a proposed legislative prohibitory measure, but in that of a Constitutional amendment to be submitted to the people. To say that the people could not be trusted to decide this or any other question would be for the Democrats to fly in the face of all their "cherished traditions." At the same time they were reluctant to submit it. The platform adopted on Wednesday tries to extricate the party from its embarrassment by resolving against the amendment, but in favor of submitting it, provided the submission is made "at a time and in circumstances most favorable to a full vote"—that is, at a general election. The treatment of the tariff question was more familiar, though scarcely so successful. The Indiana Democrats demand such a revision of the revenue laws as shall "establish a tariff for revenue" and at the same time "promote the industries of the country." In other words, freetraders and protectionists, such as Senator Voorhees, are invited to unite on common ground in support of "the teachings of Thomas Jefferson," which are put in the forefront of the platform, and in opposition to the rascally Republicans, who are belabored in good round terms for passing the Federal election laws and for "the frauds and perjuries of 1876."

A minute telegraph "war" has broken out in Dayton, Ohio, between the Western Union and the Mutual Union Companies. The Mutual Union has, it seems, a system of electric call bells by which a customer desiring to transmit messages turns a small crank in his place of business, signalling a small boy in the Mutual Union office, who then comes after the message. Sometimes, however, the customer sends messages addressed to a place where the Mutual Union has no office. In such cases the enterprising manager of the company, instead of sending the boy back with a polite message regretting the inability of the company to transmit it, has it forwarded by the Western Union Company, whose office is next door. This the Western Union officers say is an immoral and illegal practice, because by means of it the Mutual Union imposes upon its customers the belief that it has offices where it has none, and that it can "handle" business for help in which it actually has to go to the Western Union. They accordingly have refused to receive or transmit any such messages in future. But the laws of Ohio compel all telegraph companies to receive and transmit messages forwarded by other companies, and the Mutual Union has begun suit to enjoin the Western Union from further refusal of despatches. It is difficult in the forum of morals to see how any one is imposed upon by such a practice, as customers must be perfectly well aware that the Western Union has more offices than the Mutual Union. Indeed, their knowledge of the fact is probably the cause of the popularity of the Mutual Union's call system. The proper redress of the Western Union would seem to be to have a call system of its own.

Two months ago Mr. Keely, the inventor of the celebrated Keely motor, began, by order of court, to reveal to Mr. Boekel the secret of his invention. After seven weeks' constant revelation Mr. Boekel declares that he does not yet understand it, and is inclined to think that "recognized mechanical sciences cannot reach the thing." This must be very disappointing not only to the stockholders, but to Mr. Keely himself, who has announced his intention of taking out a patent. It would obviously be impossible to patent a process or invention which could not be explained or described, for the law requires description for the purpose of identification. Mr. Keely may raise the point that the constitution of Mr. Boekel's mind makes successful revelation to him impossible, and might insist on the appointment of some new person as the depositary of the secret. But the probability is that the Keely secret will long remain one of the mysteries of science.

The week in Wall Street has been uneventful. Although the surplus reserve of the New York banks was reduced about one-half (to $2,684,425), and although $1,200,000 was shipped as an "arbitrary transaction," which showed a loss to the shippers, yet the loan market for money remained easy for borrowers, and the call-loan rate did not rule above 3½ per cent. At the Stock Exchange the upward movement in securities for a time halted and hesitated, active influences having been brought into play to depress prices. Late in the week, however, a fresh start toward higher figures was taken. The developments respecting the crops were not uniformly good during the week, but the conclusion seems inevitable that all the principal crops, excepting corn, will exceed the yield of any previous year. The Egyptian trouble certainly was not narrowed in importance during the week, and the probability of a general European complication has increased. This, after first disturbing all the financial interests centring in London, would, for a time, be a great help to all our markets. General trade is very good for the season, and the prospects for the autumn are excellent. Progress was made during the week toward a settlement of the labor troubles. The freight-handlers in this city very generally returned to work, having failed to secure the advance in wages for which they struck; the iron-workers and mill operatives also gave signs of conceding the claims on account of which they stopped work several months ago.

The one important incident in the progress of the Egyptian difficulty during the week has been the British occupation of Suez, despite the comically frantic opposition of M. de Lesseps. Meantime, troops are arriving from India, and the preservation and free operation of the Canal are practically assured without a "mandate," on the simple principle of *beati possidentes*. The diplomatic incongruities and contrarieties have not diminished. The Conference still amuses itself with sessions, to which the Russian delegate has returned, and with propositions of one sort or another, which are all invalidated by the duplicity of the Porte and the reservations of France and England. No troops have actually been forwarded by the Sultan, nor has he yet proclaimed Arabi a rebel; and both public sentiment and official expression in England show a strong aversion to his doing now what the Conference was called (by England herself) to press him to do. The British Government has distinctly given notice in Parliament that its military lodgments in Egypt, "in virtue of the Khedive's proposal," must not be meddled with by the Conference. Like MacMahon at the Malakoff, it is there, and it means to remain. France, on the other hand, is not there, and has spent the week in endeavoring to form a Cabinet to succeed Freycinet's. M. Duclerc has announced his policy to be simply the country's will, and freedom of action for the country. As the country has no will, except to wait, he will have plenty of leisure to read, in the August *Contemporary Review*, Prof. Sheldon Amos's views of "reconstruction" after Arabi has been suppressed. This writer abolishes the Dual Control, and introduces a single "supervising power, acting through its ordinary diplomatic representative, who will in all respects exercise the peculiar powers entrusted to a British Resident in a native Indian State."

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, August 2, to TUESDAY, August 8, 1882, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR'S veto of the River and Harbor Bill met with almost unstinted praise from the newspapers of the country of almost every shade of political opinion. Nevertheless, on Wednesday, the House of Representatives promptly took up the bill and passed it over the veto, by a vote of 122 to 59. Of the affirmative voters there were 65 Republicans; of the negative, 28. The Senate, immediately after the reading of the veto, on Wednesday, took another vote, and passed the bill over the veto by 41 to 16. So the bill has become a law. It is thought that the President, in his annual message next December, will recommend that the customary River and Harbor Bill be omitted for 1883.

The session of Congress drew rapidly to a close during the week. In the Senate, numbers of the smaller bills were passed each day, and great progress was made with the large appropriation bills. On Wednesday the Senate passed a bill leasing the Salt Springs in Indian Territory and appropriating the royalty therefrom to the Cherokee school fund; also a bill making some minor changes in the pension regulations. In the evening, the Sundry Civil Appropriation Bill was passed, the total amount being more than $25,000,000. It contained appropriations for the purchase of the Franklin and Rochambeau papers, and $15,000 to enable the President to carry out the law to promote the efficiency of the civil service. The clause commits the Government to competitive examinations and a proper distribution of places. On Thursday, the Senate passed a resolution to print 300,000 of the agricultural reports, at an expense of $219,000. The Internal-Revenue Tax Bill was resurrected, and a debate took place on the tobacco tax. After fruitless discussion, the matter went over without action. The House adjournment resolution was laid on the table for future action, and a bill was passed to provide for deductions from the gross tonnage of United States vessels in taxation, in order to put them on a footing with foreign ships. A law was passed extending to foreign vessels the provisions of inspection laws now applicable to domestic vessels. On Friday, the House bill establishing diplomatic relations with Persia was approved.

There was a further fruitless discussion of the Tax Bill in the Senate on Friday, and in executive session an attempt was made, in the interests of the Stalwarts, to reconsider the nomination of a New York postmaster. Senator Miller took occasion to denounce the attitude of his colleague, Senator Lapham, in very severe terms. The motion to reconsider was laid upon the table, only Senators Lapham and Conger opposing. On Saturday, the Naval Bill was passed, the Senate receding from its position in regard to the closing of the Navy-yards for one year only. Discretionary power was given the Secretary of the Navy. The Senate also receded from its position on the mileage question, as a part of the Deficiency Bill, and passed a separate resolution appropriating $33,000 for the mileage of Senators who attended the Extra Session of 1881. Senator Miller obtained the floor to speak on the Knit-Goods Bill, which raises the duty from fifty-five to eighty-nine per cent. The Democrats were caught napping, and, notwithstanding many efforts to prevent it, the bill went to a vote and was passed, 36 to 15. After midnight, the conference report on the Sundry Civil Bill was adopted. The Senate was again obliged to accept the restrictions of the House. Appropriations for the purchase of the Rochambeau and other historical papers were stricken out. The appropriation for the Signal Service was cut down.

In the House of Representatives on Thursday, a resolution was reported for final adjournment at noon on Saturday. A lively discussion ensued, in which each party tried to put the blame for lack of reduction of taxes during the session upon the other. The resolution was finally passed without a division. Mr. Hutchins, of New York, on Friday, offered a constitutional amendment that it shall take two-thirds of all the members elected to each House of Congress to pass a bill over the President's veto, instead of two-thirds of the members voting. The Conference Committee on the Naval Bill reported that they had agreed with the Senate on all points but one. Instead of abolishing the office of Commodore, it was agreed that only half of the vacancies in the grades of the Navy shall be filled by promotion, until the number of officers is reduced to a certain point. The report was agreed to, and a further conference ordered. The conference report on the Legislative, Executive, and Judicial Appropriation Bill was presented and agreed to. The Sundry Civil Bill was debated, and of the 247 Senate amendments, only forty-three were agreed to. In all cases where the Senate had increased the amount appropriated there was non-concurrence.

Three remaining appropriation bills were rapidly disposed of on Saturday by the House. The Naval Bill was finally passed as agreed upon by the Conference Committee. The Deficiency Bill was finally disposed of on similar conference recommendations. At 10:30 o'clock, the report of the conferees on the Sundry Civil Bill was agreed to. Among other items, is one appropriating $25,000 for the transportation to this country of the bodies of Lieutenant De Long and his dead comrades of the *Jeannette*. Among the minor bills disposed of was a bill for the inspection of ocean-going steam-vessels, and one to pay mileage to Lieutenant Schwatka, the Arctic explorer, on account of his trip to the Arctic regions. A resolution for a joint committee of Senators and Representatives to inquire into the needs of the American ship-building industry during the recess was passed.

At the session of the Senate on Monday a number of miscellaneous bills and resolutions were hastily passed, among them the bill pensioning the widow of the late Brigadier-General Ramsey, the bill abolishing the export tax on tobacco, the joint resolution appropriating $60,000 for fees of United States District Attorneys for the last fiscal year, also the resolution for an investigation as to the loss of the *Jeannette* and the death of Lieutenant De Long, and the resolution for a joint select committee on American ship-building. A concurrent resolution for adjournment *sine die* at 5 o'clock P. M. gave rise to a severe attack upon the dilatoriness of the House in preparing the appropriation bills by Senator Plumb. He placed all the responsibility for the extended session upon them. The resolution was not passed. The Senate went into executive session and confirmed a number of nominations, among them that of John A. Luby to be Surveyor at Albany. It was opposed by Senator Miller. On Tuesday morning the Senate voted to adjourn without day at 3 P. M.—yeas 27, nays 17. The opposition votes were cast by Republicans. After the transaction of unimportant business, and the usual complimentary vote to the presiding officer, Senator Davis, with a few remarks, declared the Senate, at 3 o'clock, adjourned *sine die*.

The House spent part of Monday in finishing the uncompleted session of Saturday, and the rest of the day was occupied in a farcical contest over the Tax Bill, as introduced by Mr. Robeson, for mere party advantage. It adjourned without transacting any business in the evening. On Monday the House met, concurred in the Senate resolution for adjournment at 3 o'clock, and at that hour was adjourned *sine die* by Speaker Keifer.

The bill to regulate the carriage of passengers by sea, known as the Deuster Steamship Bill, has received the approval of the President, and is now a law.

President Arthur sent to the Senate on Thursday the nominations of William Waldorf Astor, of New York, to be Minister to Italy, and Major John C. Kinney, to be United States Marshal for Connecticut. The first named is a peculiarly political nomination, Mr. Astor being a Stalwart ex-State Senator who voted steadily for Mr. Conkling's return to the United States Senate. He was, on that account, defeated for Congress in a strong Republican district in this city. Mr. Astor's nomination has been confirmed by the Senate.

Mr. Blaine has written a long letter on the Maine campaign. He thinks that the issues are the sustaining of the Maine judiciary in their decision against the Garcelon fraud, the tariff, and the general prosperity as affected by Republican supremacy.

A number of political conventions were held on Wednesday. The Iowa Republicans nominated J. A. T. Hull for Secretary of State. The platform reaffirms the Republican platform of 1880, approves President Arthur's Administration, asks for an equitable revision of the tariff and legislation to control inter-State commerce. The Indiana Democrats nominated W. R. Myers for Secretary of State, Francis T. Hard for Attorney-General, and other State officers. The platform approves Jeffersonian principles, asks for civil-service reform, reduction of taxation and the tariff, and protection for American citizens abroad. The platform of the South Carolina Democrats also favors civil-service reform and a reduction of the tariff. The Ohio Prohibitionists on Thursday nominated Ferdinand Schumacher for Secretary of State, and other State officers.

Two Republican conventions were in session in Atlanta, Ga., for several days last week. Both conventions approved the nomination of General Gartrell, the Independent Democratic candidate for Governor.

On Wednesday, the Republican State Committee of New York met in this city and decided that the convention should be held at Saratoga, on September 20, and that the apportionment of delegates should be the same as last year—496 for the entire State. The Democrats met at Saratoga on Tuesday, and called a convention for Syracuse, Sept. 21.

Speaker Keifer has been nominated for Congress, unanimously, by the Republicans of the Eighth Ohio District.

In the Star-route trial, at Washington, on Wednesday, Mr. A. C. Buell, editor of the Washington *Capital*, testified as to his relations with Brady and Walsh, and the articles he had written on the subject of Star-routes. The testimony on Thursday was unimportant. Henry M. Vaile, one of the defendants, testified on Friday as to the business relations of the contractors.

The Government introduced some rebutting evidence in the Star-route trial on Monday and Tuesday morning. Mr. Bliss then announced that the prosecution had introduced all its testimony except that of Mr. Spencer, who was not in Washington. The Court would not grant a postponement of the hearing until he could be produced. Affidavits and counter-affidavits as to his testimony were filed. After some testimony by the defence in surrebuttal, the case was closed as far as evidence is concerned, and the rest of the afternoon was spent in making arrangements as to the final arguments by counsel.

A meeting of the National Civil-Service Reform Association was held at Newport on Wednesday. It was attended by a large and distinguished body of delegates. An executive session was held in the morning, after which Mr. George William Curtis, President of the Association, delivered an admirable address, in which he arraigned President Arthur for the removal of competent officers. The collection of political assessments was severely denounced. A reference was made to the active civil-service reform agitation in Pennsylvania as a movement which, if not heeded by parties, would yet construct parties. Mr. Carl Schurz, from the Committee on Resolutions,

reported resolutions, which were unanimously adopted, urging the friends of reform in the coming Congressional elections to interrogate the candidates as to their views on the subject, and to vote for the candidate giving most satisfactory assurances of his sincerity in the support of reform; and that if either party candidate fails to give such assurance, the friends of civil-service reform present one, if practicable, whose views are favorably known. The various civil-service reform associations are advised to prosecute offenders against the political assessment law, and the National League to test the legality of the Hubbell circular. The President of the National League is requested to bring Daniel Webster's famous civil-service letter to the attention of the Executive, and request a similar order for the correction of such abuses. A committee of five was appointed to issue an address on the subject of civil-service reform to the voters of the United States. The subject is to be also brought to the attention of clergymen and professors and friends of education.

Before the Tariff Commission, during the week, a number of industries and arts have presented their pleas, some for a reduction of the tariff, others for an increase. The advisability of putting works of art on the free list was presented on Thursday. The jute and gold-leaf industries were represented on Friday.

The steamer *Gold Dust* exploded her boilers on Monday, near Hickman, Ky., killing twenty-four and wounding forty-eight of those on board.

Three thousand men have been thrown out of employment in Chicago by the temporary suspension of work in a pork-packing establishment. The high price of corn has caused little to be fed to hogs, and few good ones are in the market.

There is yellow fever in Matamoras, Mexico, and one case in New Orleans. There are disquieting rumors in Texas, but no authentic case has yet been reported.

Rear Admiral John C. Beaumont, of the United States Navy (retired), died in Newmarket, N. H., on Wednesday, at the age of sixty-one.

Mr. Artemas Hale, of Bridgewater, Mass., the oldest ex-Congressman, died on Friday, at the age of ninety-eight. His Congressional career began in 1845.

Rear Admiral McDougal, of the United States Navy, died at San Francisco on Monday.

Gen. Gouverneur Kemble Warren died at his home, in Newport, R. I., on Tuesday evening, at the age of fifty-two. Since the decision of the Court of Inquiry as to his conduct at the battle of Five Forks he had manifested symptoms of great mental depression, which hastened his death.

FOREIGN.

A scare occurred among the British troops at Alexandria early Wednesday morning, which was at first greatly exaggerated. It seems that a picket, consisting of six men and a corporal, were sent to take possession of a clump of trees, about the middle of the British outposts, along the Sweet Water Canal. About two o'clock in the morning, fifty mounted Arabs approached, under cover of the embankment of the canal, and attacked the outpost. A number of shots were exchanged, but the picket hastily beat a retreat to the pumping station, 400 yards in the rear. Four companies were sent to support them, but the enemy had already disappeared. It was at first supposed that the picket had acted in a cowardly manner, but it was subsequently announced in the House of Commons that they had obeyed previous orders.

All the British troops were ordered to the front on Thursday morning, in expectation of an attack. An alarm was caused during the day by rumors of an impending massacre at three o'clock in the afternoon. The police exercised increased vigilance, but no disturbance occurred. The English soldiers at Alexandria are much overworked, and there is a deficiency of officers. Sir Garnet Wolseley, although suffering from Cyprus fever, sailed from England for Egypt on Wednesday. A reconnoissance was made by the British troops on Thursday afternoon to a point five miles beyond the Ramleh outposts. The enemy's position was found to be almost abandoned. A few shots were fired, but there were no casualties. The troops returned at dusk.

There was a small skirmish on Friday morning on the left front of the British lines. The enemy's attack was promptly replied to by part of the Forty-sixth Regiment. There were few casualties. A reconnoissance in force was made on Saturday afternoon, about five o'clock. The Marines, Rifles, and the South Staffordshire Regiment advanced along the canal and the railway, driving the enemy from their outposts. All their available troops were brought into action in front of their principal line of intrenchments at Kafr-el-Dwar. The Egyptian infantry held their ground with considerable steadiness. The armored train, with Nordenfeldt guns, did splendid execution on the Egyptian earthworks. The engagement lasted until sunset, with a heavy loss to the Egyptians. As there was then no sign of an advance by the enemy, the British retired in perfect order. The object of the reconnoissance was to repair the railway track, and to compel the enemy to display what force and what guns they had in front of their main position, and the object was completely attained.

The total loss of the British by the skirmish on Saturday afternoon was four killed and twenty-nine wounded. Among the killed was Lieutenant Vyse, a very promising young officer. The loss of the Egyptians is estimated at more than two hundred. In the opinion of competent military men in Alexandria nothing has been gained by this engagement to compensate for the heavy loss. On Monday another skirmish between armored trains took place at Mahalla Junction. The forty-pounder of the British caused the enemy to withdraw.

Suez has been occupied by British marines, and M. de Lesseps formally protests against it as a violation of neutrality obligations.

On Friday the transport *Catalonia* left England for Egypt with troops. Queen Victoria inspected it at Portsmouth. She wished the officers a prosperous voyage and a speedy return. Sir Evelyn Wood was on board.

The official rebel journal at Cairo has published the decision of the great national meeting held on July 29, which declares for Arabi and denounces the Khedive. Arabi has issued a proclamation that the Sultan has deposed the Khedive. His force is estimated at 70,000 men.

The acting Consul-General of the United States in Egypt telegraphs that the archives of the Consulate are safe at Cairo. It was feared that they had been destroyed.

At Constantinople, the Conference has been making progress during the week. When it met on Wednesday, M. Onou, the Russian representative, was present, but gave no reason for it; however, it is said that reassuring explanations by England were the cause. Lord Dufferin explained England's action at Alexandria to the delegates. He said that the forts had been destroyed as a measure of defence; England's sole object was to re-establish peace and order, secure free navigation of the Suez Canal, and restore the authority of the Khedive. The Ottoman delegates made an extended declaration. They denied inaction on the part of the Porte, asserting that it was ready to send troops under the terms of the identical note; but that England's subordinating her acceptance of coöperation with Turkish troops to the proclamation of Arabi Pasha as a rebel was not in accord with that declaration of the Powers. The Porte hoped that the Conference would agree to the issuing of the proclamation simultaneously with the presence of Turkish troops in Egypt, and not before they landed, as England demanded. Count Corti, the Italian Ambassador, brought forward proposals of his Government, in regard to the Suez Canal, providing for the concurrence of all the Powers, Turkey included, in a police supervision, of an exclusively naval character, of the Canal, it being reserved to the Powers to decide upon other action should this be insufficient. The representatives of Germany, Austria, Russia, and Turkey immediately signified adhesion to the proposals, but the English and French representatives declared that they must first consult their Governments before coming to a decision.

At the sitting of the Conference on Saturday, Lord Dufferin, the British Ambassador, accepted the principle of collective protection for the Suez Canal. The French Ambassador was forced to reserve his opinion, owing to the political crisis at home. The other delegates accepted collective protection, with the modification that there should only be provisional supervision of the Canal. Lord Dufferin again insisted that Arabi should be proclaimed a rebel, and demanded a written statement of the Porte's adherence to the identical note. At Monday's sitting of the Conference the Turkish delegates accepted the conditions proposed by the Powers in their invitations to the Porte to intervene in Egypt. A protocol was drawn up which was signed by all the members. Said Pasha has promised Lord Dufferin that the Porte will issue a proclamation declaring Arabi a rebel.

The new French Cabinet was officially announced in Paris on Monday as follows: M. Duclerc, President of the Council and Minister of Foreign Affairs; M. Fallières, Minister of the Interior; M. Develle, Under Secretary of the Interior; M. Devès, Minister of Justice; M. Duvaux, Minister of Public Instruction; M. Tirard, Minister of Finance; General Billot, Minister of War; Admiral Jauréguiberry, Minister of Marine; M. Cochery, Minister of Posts and Telegraphs; M. de Mahy, Minister of Agriculture; M. Pierre Legrand, Minister of Commerce and *ad interim* of Public Works. On Tuesday the Premier declared his policy in the Chambers. He accepts the vote of the Chamber of Deputies on the Egyptian credit as determining his foreign policy. The vote of the Chambers will also determine his home policy. Senator Duclerc is seventy years of age, an ex-journalist, and a stanch Republican.

Amid cheers, Mr. Gladstone announced in the House of Commons, on Thursday, that he would not take up the Arrears Bill until Tuesday, as he did not wish to do anything precipitately before arriving at what might be a momentous decision. On Tuesday afternoon Mr. Gladstone, moving the consideration of the amendments of the House of Lords to the Arrears of Rent Bill, said that he should have to ask the House to dissent substantially from the first amendment. The Government will propose to enact that either a landlord or tenant can initiate proceedings subject to ten days' notice. Mr. Gladstone did not ask for a rejection of the second amendment, but to amend it so as to provide that in a case where a tenant's right is sold within seven years, the landlord shall have a lien on the proceeds for the arrears he has been deprived of by the action of the bill to the extent of one year's rent, the landlord only to have this lien if the sum realized by the sale of the tenant-right equals three years' rent. The first amendment was rejected by a vote of 293 to 157, and all of Mr. Gladstone's proposals were agreed to.

A strike is threatened among about 5,000 of the Irish constabulary. They demand increased pay.

A riot occurred in Trieste, Austria, on Wednesday, caused by a petard being thrown into the ranks of the Society of Veterans by members of the Italian faction.

GOVERNMENT ECONOMY.

THE discreditable fact that the chairmen of the committees on appropriations of the Senate and of the House of Representatives differ to the extent of many millions in their statements of the amounts of money actually appropriated at the late session of Congress, is a sign of the confusion and the random methods which prevail under the present practice of disposing of the public funds. On Monday Senator Plumb made a speech in which the House of Representatives was severely but justly taken to task for its dilatoriness in maturing the appropriation bills. It appears that not one of the important ones reached the Senate until near the close of the fiscal year, and some of them only after its close, so that when the term of the old appropriations expired the Government would have been without funds for its daily needs had not the makeshift of continuing for a limited period last year's allowances been resorted to; and that the Senate had no time for a careful consideration of details before acting on the bills. Now when, in ordinary, quiet times, we see a House of Representatives toil for six months or more over a few appropriation bills to provide for the current needs of the Government, the Senate following in its wake, and then the chairmen of the committees which in the two houses of Congress have this subject in charge, and are obliged carefully to consider and digest it, both being experienced and conscientious gentlemen, differ widely as to the sums of money which have been allowed, and, as the final outcome of it all, a reckless profusion of expenditures which alarms the whole country, every intelligent observer will readily conclude that there must be something very crude and reprehensible in our way of doing these things.

There are certain simple principles which in a well-regulated Government household will never be lost sight of. We are levying taxes for the purpose of raising money to defray the necessary expenses of the Government. This is the object, and should be the only object. We should therefore first know what the necessities of the Government are, and then adjust our system of taxation to those necessities. In this way the Government will be provided with what it needs, and the people will not be burdened with taxation which is not required. Those who make appropriations of money, as well as the people generally, will then never cease to be clearly conscious of the fact that every dollar appropriated has to come from those who pay the taxes, and that every increase of appropriation must necessarily be accompanied by an increase of the taxes to be imposed upon the people. Whenever this system is followed—that is to say, whenever the proper relation between income and outgo, between taxes and expenditures, is properly and constantly observed—there will be reasonable and systematic economy, and if a spell of extravagance ever occurs, it will not last long.

What is our way of doing things? We have been long continuing a system of taxation yielding revenues far beyond our actual needs, and the result is, that instead of first ascertaining what the necessities of the Government are, and then providing for them by appropriate taxes, we raise an abundance of money by taxation, and then leave it to the inventive genius of Congressmen to discover purposes for which the money may be spent. It does not require the gift of prophecy to foretell the consequences. Even the wisest and most virtuous assemblage of men would, under such circumstances, feel itself subject to a very great temptation; while an assemblage of politicians, mostly elected under the influence of the spoils system, will wish nothing better than to be tempted in order to succumb. We have no reason to be surprised when we read in the newspapers that the principal question asked and considered by such politicians under such circumstances was, how to spend the surplus so that each one might have the greatest possible benefit from it. The loading down of appropriation bills with an endless variety of schemes, and the bewildering confusion created by the general grab game, so that at last nobody knows how much money has been voted away, and the only certain thing is that the amounts are alarming, are the natural result of such a system or want of system.

It is obvious how much in the way of bringing order out of chaos would be accomplished by introducing the practice of having a complete budget of necessary expenditures, and of the taxation required to cover them, prepared by the executive branch of the Government and submitted to Congress at the beginning of each session. What we have now is merely the estimates of the different departments of the amounts of money they want. What is needed is, aside from the grouping together of these amounts, showing the total sum required by the Government for the year, a clear statement of the different kinds of existing taxes, with their yield, and the opinion of the Executive as to what taxes will best subserve the purpose, what taxes may be cut down or abolished, and so on. A clear summing up in a statement of this kind would be sure to attract the attention and to reach the understanding of every intelligent taxpayer. It would be generally assumed that the Executive, having the best information about the actual needs of the Government, would ask for all the money really needed, while the distinct personal responsibility assumed by it in making its demands and statements would keep it within the bounds of proper economy. The Appropriations Committee would find much of their work done before they sat down to it. The proper relation between appropriations and taxes would become much clearer not only to the minds of Congressmen, but to the minds of the people too, and the latter would be likely to exercise a much more intelligent and effective vigilance over the former, and thus keep them from running into wild extravagance beyond the figures of the budget. The necessity of a change of this kind has never appeared more urgent than after the experiences of the present session. It should be seriously considered, and might, if foreign examples are not allowed to be conclusive, at least be tried as an experiment.

WHAT IS AN "OFFICER"?

THE Attorney-General's recent opinion that the term "officers" used in the Anti-Assessment Act does not include members of Congress, was founded in great measure on the interpretation given to the word by Judge Story in his commentaries on the Constitution. As the decision of Mr. Brewster does not dispose of the question finally, and it is sure to come up again, it is worth while before the matter passes out of the public mind to examine it a little more carefully than the Attorney-General or Mr. Hubbell has been disposed to do.

The Constitution of the United States provides (Art. 2, sec. 4.) that "the President, Vice-President, and all civil officers of the United States," may be removed from office by impeachment. This Mr. Justice Story, in his commentaries, criticises as follows: Sec. 789. "Who are 'civil officers,' within the meaning of this constitutional provision? . . ." "The sense in which the term ["civil"] is used in the Constitution seems to be in contradistinction to *military*, to indicate the rights and duties relating to citizens generally, in contradistinction to those of persons engaged in the land or naval service of the Government. . . ." Sec. 790. "All officers of the United States, therefore, *who hold their appointments under the National Government*, whether their duties are executive or judicial, in the highest or in the lowest departments of the Government, with the exception of officers in the Army and Navy, are properly civil officers within the meaning of the Constitution, and liable to impeachment. . . ." Sec. 791. "A question arose upon an impeachment before the Senate in 1799, whether a Senator was a civil officer of the United States, within the purview of the Constitution, and it was decided by the Senate that he was not; and the like principle must apply to the members of the House of Representatives. . . . The reasoning by which it [the decision] was sustained in the Senate does not appear, their deliberations having been private. But it was *probably* held that 'civil officers of the United States' meant such *as derived their appointment from and under the National Government*, and not those persons who, though members of the Government, derived their appointment from the States, or the people of the States. In this view, *the enumeration of the President and Vice-President, as impeachable officers, was indispensable; for they derive, or may derive, their office from a source paramount to the National Government.*" Judge Story then proceeds: "And the clause of the Constitution now under consideration does not *even affect* to consider them officers of the United States. It says, 'the President, Vice-President, and *all civil officers* (not all *other* civil officers) shall be removed,' etc. The language of the clause, therefore, would rather lead to the conclusion that they were enumerated *as contradistinguished from*, rather than included in the description of, *civil officers* of the United States." By this construction it is shown that the President is not a "civil" officer, and as the term "civil" is used in contradistinction to "military" (sec. 789), it follows that he is a *military officer*. This conclusion might have

been further strengthened by a reference to Art. 2, sec. 2, of the Constitution: "The President shall be Commander-in-Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual service of the United States." But having accepted this construction, our gratification in having the question settled is disturbed by the suggestion that this may not be a *final* opinion. We remember that it was implied that the President was not an officer of the United States at all; that the President derived, or might derive, his office from a source paramount to the National Government. But the conclusive proof of this proposition is not given with the same fulness with which Judge Story demonstrates that the President is a military officer of the United States, and we find great difficulty in harmonizing this view with the following clause of the Constitution: Art. 2, sec. 1. "The Executive Power shall be vested in a President of the United States of America. He shall hold his office during the term of four years. . . ."—which clause has always been regarded as creating and establishing the office of President. The result of the discussion seems to leave the meaning of the word officer under the Constitution involved in grave doubt. Yet it is upon this discussion that the Attorney-General founds in great measure his conclusion that it is perfectly plain that members of Congress are not officers within the meaning of the act of August 15, 1876, Chap. 287, sec. 6, and that it is idle to carry the question before the courts. The section is as follows: "That all executive officers or employees of the United States not appointed by the President, with the advice and consent of the Senate, are prohibited from requesting, giving to, or receiving from, any other officer or employee of the Government, any money . . . for political purposes. . . ."

The question raised is as to the meaning of the words "any other officer." The Attorney-General says:

"But it seems that a member of Congress is not an officer of the United States in the constitutional meaning of the term In the case of Blount, on an impeachment before the Senate in 1799, the question arose whether a Senator was a civil officer of the United States within the purview of the Constitution, and the Senate decided that he was not. This question arose under the fourth section of the second article of the Constitution.

"'Other clauses of the Constitution,' observes Judge Story in section 733 of his work on the Constitution, 'would seem to favor the same result, particularly the clause respecting appointments of officers of the United States by the Executive, who is to commission all the officers of the United States, and the sixth section of the first article, which declares that no person holding any office under the United States shall be a member of either House during his continuance in office, and the first section of the second article, which declares that no Senator or Representative, or person holding an office of trust or profit under the United States, shall be appointed an Elector.'"

This is a continuation of the argument in the "Commentaries" quoted under section 791, above. The Attorney-General then cites section 3 of the Fourteenth Amendment and certain sections of the Revised Statutes in which members of Congress are contradistinguished from other officers in a similar way. He concludes as follows:

"Section 6 of the act of August 16, 1876, being legislation of the same character as that just referred to, it is fair to assume that the word 'officer' is there used in the narrower sense adverted to, and that it does not include a member of Congress. The provisions of that section are intended to regulate the conduct of the inferior officers of the Executive Department of the Government, etc., with respect to these and other officers, etc., who are in the public service as ordinarily understood. To place a construction there which would embrace among the latter those who are not officers in the common acceptation of the word, and thus enlarge the penal effect of these provisions, would not be warranted by any sound rule of interpretation. Upon these considerations, I am of opinion that a member of Congress is not an officer of the Government within the meaning of that section."

Upon this reasoning he assumes (1) that members of Congress "are not officers in the common acceptation of the word"; (2) that to place a construction upon the Act which would embrace members of Congress would "enlarge the penal effect" of its provisions; (3) that this "would not be warranted by any sound rule of interpretation."

These propositions will be considered in their order. (1) Are members of Congress officers in the common acceptation of the word? The Attorney-General himself says upon this point:

"Unquestionably, the station of members of Congress, Senators, or Representatives is a public office, taking these terms in a broad and general sense, and the incumbent thereof must be regarded as an officer of the Government in the same sense. Thus provision is made for administering 'an oath of office' to the members of both Houses of Congress; so the words, 'Every person appointed or elected to any office of honor or profit, either in the civil, military, or naval service,' employed in Section 1756, Revised Statutes, which prescribes an oath of office, includes members of Congress; so in Section 1786, which provides that 'whenever any person holding office, except as a member of Congress,' etc., the station of member of Congress is distinctly recognized as an office."

In Olmstead *v.* the Mayor of New York (42 New York Superior Court, 481), the following definition of an officer is given: "An officer is one who is invested with an office." This raises the question, What is an office? The following definition of an office was given in the same case: "An office is a right to exercise a public function or employment, and take the fees and emoluments belonging to it." Similar definitions have been given in other cases, but they are not very satisfactory. The following definition may be found in United States *v.* Hartwell (6 Wall., 393): "An office is a public station, or employment, conferred by the appointment of Government. The term embraces the ideas of tenure, duration, emolument, and duties." The word "appointment," as employed in this definition, must include *election;* otherwise, all elective offices would be excluded, and among them that of President. So, also, for the same reason, the word "Government" is manifestly used in a similarly broad sense. The word "appoint" is used in the Constitution in relation to certain elective offices—*e. g.*, Presidential Electors. "Each State shall *appoint* . . . a number of Electors" (Art. 2, sec 1). Strictly considered, the clause "conferred by the appointment of Government" does not appear to be any part of the definition of an office. It simply states *how* an office is *conferred*, not *what* an office *is*. Nor does it appear to be a distinguishing mode of conferring an *office*. There are public employments which are not offices, which are "conferred by the appointment of Government." A special agent appointed by the Secretary of War, to superintend the construction of a public building for which an appropriation is made, under the implied authority arising from the appropriation and attending circumstances, is not an officer. He is an employee. So, civil surgeons appointed by the Commissioner of Pensions, under Section 4777 of the Revised Statutes, are not officers (United States *v.* Germaine, 99 U. S., 508).

An office is a public employment, and something more—that is, some further qualification is necessary to distinguish it from those public employments which are not offices, such as special agents, employees, and others. This was probably perceived by the Supreme Court in United States *v.* Hartwell, but the clause employed for the purpose does not appear to supply the necessary qualification. An office appears to be distinguished from all other public employments by its being established by law. The Constitution provides that the President ". . . shall nominate, and by and with the advice and consent of the Senate shall appoint, Ambassadors, other Public Ministers and Consuls, Judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and *which shall be established by law*" (Art. 2, sec. 2). Considered grammatically, there may be doubt whether the clause, "which shall be established by law," relates to "appointments" or to "officers," but logically, it relates to *offices*. It is to be read, all other *offices* of the United States which shall be established by law.

The distinction is also indicated by the difference in the source of the right of an officer and of an employee to compensation. The compensation of an employee arises from contract, either expressed or implied. The compensation of an officer is the reward which is authorized by law to be paid to him. It is given upon grounds of public policy, by reason of the public employment. The right of an officer to the compensation of an office does not arise from contract, either by reason of his appointment or of services rendered by him; it is a statutory grant, and as such it is incident to the legal title to the office. The amount and character of the compensation of an office are subject to the control of Congress, except in those cases in which such control has been restricted by the Constitution (People *v.* Tieman, 30 Barbour, 195; Emboy *v.* United States, 100 U. S., 680).

If this reasoning is correct, an accurate definition of an office of the United States would be given as follows: An office is a public station, or employment, established by law. In its fullest extent, it would comprise a title, possession, a tenure, a term, public duties and powers, and personal rights and privileges of the incumbent.

Under the last or any of the definitions given above, a member of Congress would be an officer of the United States. The fact that Congress has in some instances used language which implies that, *in those cases*, it distinguished its members from other officers, would not warrant the inference that the words, "any other officer," used in the act of August 15, 1876, were not intended to include members of Congress. The effect of such an infe-

rence would be to insert an exception in the act, so that the phrase would read: "Any other officer, *except* Senators and members of the House of Representatives." There is no ground for assuming that if the attention of Congress had been called to the subject it would have made such an exception. The presumption is that Congress used the words in their ordinary and *general* sense—*i.e.*, that it intended precisely what it said. To justify the construction proposed, it must be clearly shown that the words "any other officer" do not in their ordinary and general sense include members of Congress. This the mere fact that they have sometimes been used in a narrower sense fails to do.

The second and third propositions of the Attorney-General are: (2) to place a construction upon the act which would embrace members of Congress would enlarge the *penal* effect of its provisions; and (3) this would not be warranted by any sound rule of interpretation. The language is not as clear as could be wished, but it appears to imply that where general words which are sometimes used in a broad and sometimes in a narrow sense are employed in a penal statute, the rule does not warrant the interpretation of them in their broad sense. There is, however, an important consideration here which is not referred to by the Attorney-General—namely, the nature of the mischief and the remedy. When this act was passed, it was well known to Congress that contributions for political purposes were made through its members. To have excepted them from the provisions of the act would have been to impair, if not to entirely nullify, the statute. To do this by construction "is not warranted by any sound rule of construction." Moreover, the rule of strict construction does not mean that a narrow sense must be given to the words, but that the case must come within the words; thus "house" includes not only "abode," but "building" (State *v.* Powers, 36 Conn., 77). That is, they are not to be extended by implication. Penal as well as beneficial statutes are to be so construed as fairly to suppress the mischief and advance the remedy (Parkinson *v.* State, 14 Md., 184); and are to extend to every case within the mischief, if within the words (Hoffman *v.* State, 29 Ala., 40). We are bound to interpret penal statutes according to the manifest import of the words, and to hold all cases which are within the words and the mischief to be within the remedial influence of the statute (The Schooner *Industry*, 1 Gall., 114). In United States *v.* Winn, 3 Sum., 211, it is said:

"Now, I do not think anything material in the construction of this statute can turn upon the rule, so ably and strenuously expounded at the bar, that penal statutes are to be construed strictly. I agree to that rule in its true and sober sense; and that is, that penal statutes are not to be enlarged by implication, or extended to cases not obviously within their words and purport. But where the words are general, and include various classes of persons, I know of no authority which would justify the court in restricting them to one class, or in giving them the narrowest interpretation, where the mischief to be redressed by the statute is equally applicable to all of them. And where a word is used in a statute which has various known significations, I know of no rule that requires the court to adopt one in preference to another, simply because it is more restrained, if the objects of the statute equally apply to the largest and broadest sense of the word."

Of course the Attorney-General may be right, and this argument wrong. But no fair-minded man will agree with Mr. Brewster that this question is too plain to be discussed.

CAMP-MEETINGS.

THE *Tribune* of Monday, in speaking of the camp-meeting season, declares that with every year the projectors of these gatherings recognize their undertaking more and more to be merely a "business enterprise," like a beach hotel, or an excursion; while "the old-fashioned camp-meeting, with its zeal, its excitement, its real fervor, and its blasphemy, is rapidly becoming an almost extinct social phenomenon," and regrets that "the manner in which these meetings have been conducted hitherto has not justified the belief that the convocation of huge crowds in a seaside resort to bathe, flirt, pray, and repent of their sins at once, is conducive to the successful presentation of the cause of Christ."

The projectors of camp-meetings might obviously defend themselves against this criticism by urging that a huge religious seaside pilgrimage is impossible without a carefully planned business organization, and that from the time of the Crusades to the present day no large heterogeneous multitude has ever got together and remained together for some time without a good many things happening of a sort to make the judicious grieve. As to the "old-fashioned" camp-meeting, they would probably say that the camp-meeting must always be very much what the community is: it is a democratic and voluntary assemblage; and if it was more zealous and fervid fifty years ago than it is now, this must be simply because the community has lost its zeal and fervor. That is no reason why it should not obey its religious instincts, such as they are.

Of course it is impossible to deny that camp-meetings may do some good. We have no means of comparing the condition of society as affected by camp-meetings with its condition as it would be without them. But as a religious phenomenon, their continued success is one more indication of the general change which is coming over religion all over the world, as dogmatic faith of all sorts loses its hold on men's minds, and as the old mediæval idea of penance as a necessary means of salvation becomes more and more unpopular. Were it possible to imagine a good mediæval monk conducting a camp-meeting, nobody can question that it would be a very different affair from any camp-meeting that we know anything about now. In the first place, he would not select a cool place to hold it in. He would argue that, the road to spiritual grace being through mortification of the flesh, a meeting of the sort in summer ought to be held in as hot a place as possible. Instead of the seaside he would, therefore, select a city, and, if he knew the United States, would probably pick out New York as, on the whole, the best place for his encampment. By selecting a few unimproved up-town blocks for his camping-ground, and holding an occasional prayer-meeting in a down-town "garden," he could probably inflict enough physical torture on his hearers to make them ready to do almost anything he assured them was good for their souls. By forbidding the consumption of ice-cream, separating the sexes, and so cutting off all opportunities for "flirting," and prohibiting all use of the public baths, he would still further promote the misery of his congregation; while with vivid pictures of how infinitely greater their suffering in a future life would be if they did not turn from their sins and repent, he would make them feel the practical value of religion.

Such camp-meetings as these were not tried in the middle ages or set on foot by the Calvinistic inheritors of the mediæval ideas of future rewards and punishments, chiefly because railroads were unknown, and locomotion was consequently difficult. Monastic life at its best was, however, based on the theory that happiness hereafter was only to be obtained by misery here; and had the monks had railroad facilities, there can hardly be a doubt that they would have got up just such camp-meetings as we have suggested. But they could only have been successful in an age of belief. In an age of doubt like ours, exactly the opposite policy has to be pursued: people have to be tempted and wheedled into religion, not frightened or persecuted into it. As the world has become skeptical, and the necessity of "having a good time" while life lasts has become impressed upon people's minds more and more, religion, which must always offer inducements of some kind to detach the worldling from his ordinary pursuits, is obliged to make very different propositions to him. The camp-meeting is merely one of the agencies for doing this, just as the æsthetic movement in "swell" churches, with its appeal to the love of painting, music, and ornamentation, is with a different class. Of course, as the class is less cultivated and intelligent and refined, the inducements held out will be less so too. Instead of appealing to the ear and eye and the mind, an appeal may frankly be made to the stomach. People who would not care a straw for mural paintings may be tempted by ice-cream. A family which does not know the difference between a Gregorian chant and *La ci darem*, may be induced to join the movement by the prospect of daily surf-bathing. From this point of view the camp-meeting as an institution merely illustrates a religious extreme. The same country which, a hundred and fifty years since, produced Jonathan Edwards, has now for a certain class of the community so modified the terrible dogmas that he taught that his successors find one of the most popular forms of worship to consist in a protracted picnic.

THE BRITISH GOVERNMENT ON EGYPT.

LONDON, July 24, 1882.

THE debate in the House of Commons on the vote of credit for the expenses of the British expedition to Egypt begins to-night. But before party controversy has developed, not to say distorted, the position of the Government, it is worth while examining with some care the assumptions from which the British Foreign Secretary, Lord Granville, starts, and to which he has given distinct expression in the despatch, just issued to the public, which was addressed to Lord Dufferin, British Ambassador at Constan-

tinople, on the 11th of July, the day of the bombardment.

Lord Granville refers back to the treaty of the 15th of July, 1840, which, he says, "provides that the administration of the country should devolve on the descendants of Mohammed Ali in the direct line." This, by the way, is a very summary, and therefore inexact, account of the transaction referred to. It was in fact a convention to which Great Britain, Austria, Prussia, Russia, and the Porte were parties, the purpose of which was to protect Constantinople against Mohammed Ali, the rebellious but all-victorious Viceroy of Egypt, on condition that the Porte guaranteed to the Viceroy the hereditary government of Egypt, and also life-government of southern Syria. The terms of submission of Mohammed Ali were incorporated in the convention; but they were not conformed to at the time. It took a year to secure Mohammed Ali's compliance, and it was not obtained without active military operations by the British fleet on the Syrian coast, including the bombardment of Acre, and direct political pressure by Commodore Napier. However, the submission on the terms of the convention of July 15, 1840, was ultimately secured so far as Egypt was concerned, and the fact of it was recited in a protocol agreed to by the conference of London on July 12, 1841, between the same Powers which were parties to the convention. France, which, in spite of long holding off, the day after joined the other Powers in a treaty for the protection of the Dardanelles and the Bosphorus, may be held to have implicitly acquiesced in the arrangement.

Lord Granville might have dwelt on the circumstance that Great Britain took the lead in all these transactions, and was, in fact, more responsible than any other single Power for the separation of Egypt from Turkey and for the proper administration of Egypt under the dynasty of Mohammed Ali. The history of this earlier relationship to Egypt is a necessary preface to the concern of Great Britain in the recovery of the country from the financial ruin and degradation which were the consequences of the misgovernment of Ismaïl, the ex-Khedive, and Mohammed Ali's grandson. His Lordship passes lightly over the circumstances which led to and justified the interference of England and France in the latter part of Ismaïl's reign, for the purpose of financial reconstruction, though he describes with precision the nature of the institution of the European "Control." The real justification of this special interference must be sought and found in the peculiar measure in which, in Egypt, bad finance and a reckless system of borrowing were implicated with every form of bad government. It needed great pressure on the Khedive to procure his assent to the Commission of Inquiry of 1878, in which all the chief European Governments were represented, and which reported on the whole state of the country and of the administration so far as the national finances could possibly be affected by it. The most important recommendation it made was in favor of restricting the irresponsible despotism of the Khedive. It was this unlimited control of the Government which enabled him to borrow money to any amount he pleased from astute European money-lenders, and to oppress his people by extortionate taxation and wild military undertakings involving tyrannical modes of conscription. The report and recommendations of the Commission were adopted by the states of Europe, and France and England were practically charged to act upon them. After many tentative and unsuccessful efforts to introduce a reign of order, and to promote solvency under the Khedive Ismaïl, he was finally displaced, and his son Tewfik made to reign in his stead. The new Khedive thus reigned by a strictly European title, while the English and French officials, to whom was entrusted an absolute veto on all Ministerial acts which they might hold prejudicial to the financial settlement, exercised an effective check on capricious rule. At the same time a number of special arrangements, boards, commissions, and liquidation schemes, were put in working order under European administrators, with the view of paying a reduced interest to the bondholders in a way least burdensome to the people, and of ultimately freeing the country from its obligations.

Of course such laborious and comprehensive intervention as this could not be carried out without exciting all sorts of animosities against Europeans, and stirring to organized opposition all those who had vested interests in abuses and corruption. It was easy in the minds of Englishmen at a distance to confuse the love of native misgovernment with a patriotic sentiment of resistance to the intrusive foreigner. The army was the most centralized and cohesive of all the persons and bodies which suffered from retrenchment and reform. It thus naturally happened that among the army, even so early as in the last year of Ismaïl's reign, a revolutionary spirit first manifested itself. Lord Granville tersely describes the successive steps by which the military authority obtained ascendancy over the civil.

It has been said in some quarters that it is no imputation on the essentially patriotic character of an Oriental revolution that it first finds voice in the army, because in Eastern countries the army usually represents the only part of the population which is not depressed to the level of what would be slavery in the West, and consequently unable to entertain or express any political cravings. But this excuse at least demands that the rank and file of the army should, from the first, share in, if not anticipate, the action of their leaders; and it is more than a suspicious sign if, for some months, or rather for two years, the only malcontents are a few of the chief officers, and the only political demands urged relate to personal advancement, to promotion, to increase of pay, and to the transfer of effective power over the army from the civil authority to the officer of the army.

Lord Granville explains the bombardment to have been a matter of "simple and legitimate self-defence." He says Her Majesty's Government had no right to expose the fleet by a course of passive neglect to the increased danger which the threatening preparations involved, and he notices that those preparations were persisted in "in defiance of the orders of the Sultan, of the wish of the Khedive, and in contravention of the explicit assurances" of the military authorities. It is scarcely worth while, except as a matter of abstract legal interest, to inquire now whether the bombardment was, in fact, a declaration of war in itself, or, like "reprisals" and "retortion," an isolated act limited to its immediate purposes and consequences, and which might or might not be followed by a state of war. No doubt a state of war would have been held to exist during the bombardment itself, so far as to carry with it all the consequences of the distinction between "combatants" and "non-combatants," and of the restrictions of needless severities and of good treatment of prisoners and the like. But the state of war was local and transient, and could not have borne any legally extensive interpretation beyond the precise necessities of the case, as prescribed by humanity and legal analogy. The concluding passage of Lord Granville's despatch puts the English case concisely and yet adequately.

On the whole, it is seldom that so large an amount of unanimity has existed in the country on the eve of war. The daily papers, by an extraordinary energy of telegraphic correspondence almost from hour to hour, have kept the people thoroughly well informed, and, on the whole, the papers are nearly of one mind. The main criticism in to-night's and to-morrow's debate will be of an *ad hominem* kind, addressed to Mr. Gladstone's Government, for engaging in a similar active foreign policy to that which they condemned in the case of Lord Beaconsfield's Government. Other criticism will be founded on the delay, and some of the incidents of the diplomacy. Of course, those who resent all sorts of intervention will have their say, though it will scarcely be expected that Mr. Bright will endeavor to defend in words the arbitrary line he has drawn, by leaving the Government, between assenting to a demonstration of force and joining to command the use of it. A.

"PARSIFAL" AT BAYREUTH.

BAYREUTH, July 23, 1882.

THE rehearsals for the impending performance of "Parsifal" are making satisfactory progress. Every morning and afternoon a few dozen carriages containing the leading vocalists of all Germany and Austria may be seen creeping up the hill, about a mile beyond the centre of the town, on which the Wagner Theatre stands. The rules as to the exclusion from the rehearsals of non-participants are this time most rigidly carried into execution. An enterprising foreign critic who endeavored to secure admission under the protecting wing of a prominent vocalist soon discovered that he had reckoned without his host. Wagner, fearing that he might yield to the urgent solicitations of friends, has put the whole matter into the hands of a festival committee, with summary orders not to make any exceptions. This enables him to maintain toward his patrons the friendly-severe attitude of Kaiser Wilhelm, who tells his servants when they make a blunder, such as leaving open a door, that if they do so again he will inform the court marshal.

Wagner himself is, as usual when he superintends the production of a work of his, in a state of incredible activity and nervous tension. Doubtless his Italian tour last winter was undertaken principally with a view to lay in a good stock of vitality and health for the great demands the months of July and August were to make on him. During the rehearsals he is omnipresent and omnipotent—like a ship's captain or a general, who knows the duties of all his subordinates better than they do themselves. One moment he stands before the orchestra and begs them to repeat a certain passage more softly or with more emphasis and expression in the individual parts. The next moment he is in the middle of the auditorium, studying the effect of the scenery. Returning to the stage, he stands before the vocalists, shows them how to interpret certain passages, how and where to stand, what mimic expression to assume, how to hold their hands, and how to walk; all of which shows that Wagner while composing has the image of the whole situation with all its details as clearly before his eyes as if he saw it in its stage embodiment. So closely, indeed, does he anticipate the general result that, where an error of calculation does creep in, it affects him like a terrible disappointment. This happened a few days ago, when it was found that one of the intended very effective scenic transformations took more time than the progress of the music allowed it, so that it had to be modified somewhat. But if anything succeeds according to his wish and intention he expresses his satisfaction with the innocent happiness of a child. Frau Cosima Wag-

ner had assisted him, it seems, in devising some of the floral decorations for the scene in the wizard *Klingsor's* castle in the second act, where the charming flower-girls endeavor to allure the "guileless fool" *Parsifal*. When this scene was first presented Wagner shouted to Frau Cosima, in the auditorium, "You see, my dear little wife, that we can get up something together, after all." I quote this little incident chiefly as another illustration of the assistance occasionally rendered great men by their wives.

While Wagner is thus busy every day for five or six hours, notwithstanding his sixty-nine years, it is natural that he should not be very accessible to strangers. All his personal and epistolary intercourse is during the festival as far as possible attended to by his wife. It is only in this way that Wagner is enabled to give all his time and attention to his artists. These are all so devoted to him that they gladly sacrifice their whole summer's vacation, and large sums of money for "starring engagements," for the mere honor of singing at Bayreuth and for the benefit of Wagner's personal instruction. Never, surely, have artists been more devoted to their teacher and the task he has set them. Two of the vocalists chosen to act the part of *Kundry* (one of the most wonderful of creations) told me on the same day that they were repeatedly unable to restrain their tears—and these were only imperfect rehearsals. The piano score gives no idea of the beauty of the music, especially in the third act, in which Joseph Rubinstein has done some inferior work. The enthusiasm the music creates in all the artists is the most convincing proof of its grandeur, and it is this enthusiasm alone which enables them to interpret their terribly difficult parts in an effective manner. For it must be remembered that the time devoted to rehearsals is this year very brief—less than four weeks. Wagner's intention at first was to have full rehearsals for those vocalists only who appear on the first night (every leading part is to be sung by three artists in turn), the others being present in the auditorium to take notes. Some of the artists, however, objected to appearing without preliminary rehearsal, so that the plan of operations had to be altered and extended, much to the discomfiture of the poor instrumentalists, who are obliged to sweat in their "mystic abyss," which affords them only this advantage—that they can play without their coats on, or even in bathing-suits if they please, as no one in the auditorium can see them.

The poor tourists and critics who came here a week before the first performance, in the hope that they might get into the theatre during the rehearsals without the assistance of the Nibelung's Tarnhelm, by which they might make themselves invisible, are now obliged to spend their time in visiting the sights of Bayreuth—Jean Paul's house, the lovely Hermitage; King Ludwig's castle, with its parks, gem-covered Apollo temple and complicated waterworks, once the residence of the sister of Frederick II., who here wrote her well-known memoirs; or the Lustschloss and Park Fantasie, the property of Duke Alexander of Würtemberg, but now to be sold to some wealthy private persons; or the tower commemorating the victories of the Franco-German war, erected on the top of a hill high above the Wagner Theatre, from which a charming view is obtained of Bayreuth and the numerous groves, wooded hills, and picturesque villages in the neighborhood. About the time of sunset the top of this tower is one of the most romantic situations a poet could find to await inspiration, and I should not be surprised to hear that Wagner was frequently seen there with a note-book in hand. After supper many of our rehearsal excluded tourists or pilgrims may be seen on the piazza of one of the two restaurants built at the sides of the Wagner Theatre, watching to get a glimpse of the artists as they come out. Behind the theatre there is usually a group of Bayreuthers, trying to catch such of the sounds as will penetrate through the walls. These Bayreuthers of course seldom have money enough to pay thirty marks for an admission ticket, but they are all full-blooded Wagnerites nevertheless. Who would not esteem the man who has given Bayreuth for music the importance Weimar once had for poetry, and who once in a while enables every Bayreuther to rent his spare rooms at the rate of a dollar a day, where ordinarily he could only get a quarter? To all appearance, the Bayreuthers are going to be more rational this time than they were during the Nibelung festival. On that occasion they threatened to kill their goose for the sake of its one golden egg; and the indignation aroused by their extortions was so great that it threatened to make another festival impossible. In 1876 I had to pay with a friend ten marks ($2 50) a day for a small damp room with two beds; this time I have a large airy room, facing a lovely garden, for four marks a day. A good *table d'hôte* dinner can be secured at the Hôtel Sonne, amidst all the "Parsifal" singers, for fifty cents, and an excellent bottle of Rhine wine for the same price. These are not ruinous prices for those who can afford to come to Bayreuth to hear "Parsifal"; and it is possible to get along much cheaper yet at the restaurants, where, too, one can hear the instrumentalists discussing their parts, or a group of flower-girls drinking unæsthetic beer and criticising the flowers allotted to them on the stage because the petals in some of them are pointed the wrong way. To the Bayreuthers these flower-girls are an object of especial interest; and there are indeed few features of the "Parsifal" scenery which are not already spoken of as familiar objects in all the beer-houses. Yesterday I even met a little butcher boy who whistled the four simple notes of the bell motive out of which Wagner in the first act constructs such a wonderful symphony.

Those who have kept an eye on Wagnerian criticism in newspapers and pamphlets since the "Nibelung" performances in 1876 must have been frequently surprised or amused at the extreme animosity constantly shown toward poor Bayreuth. Not only the enemies, but some even of the friends, of the new music-drama are convinced that the plan of building a special theatre and organizing a series of festivals in a small provincial town was only a whim of Wagner's, which he was enabled to carry into execution through the generosity of a royal friend and his numerous admirers, who formed themselves into societies to further his project. Any one of the German capitals, we are told, with its old-established opera-house, would have been a more favorable place for successfully realizing such a plan.

From a financial point of view this is doubtless true, for Germans as a class are too poor to make a long tour (or Bayreuthiad) every three years to hear an excellent operatic performance; and it is quite possible that Wagner exaggerates the advantages to be gained by freedom from the turmoil and excitement of city life, and the concentration of the mind for days at a time on one object. But those who thus plead for the large cities thereby show that they have not read the history of Wagner's life. He was obliged to conceive the plan of Bayreuth because no German capital offered him an opportunity to produce his Tetralogy in accordance with his own intentions and principles. The great success achieved by that work in 1876, and in every German city where it has since been produced, has of course so completely changed the state of affairs that it is safe to say there is not a single manager in this country who would not have jumped at the opportunity to produce "Parsifal" on any conditions its author might name; and if Wagner should change his mind in regard to this drama as he did with his Tetralogy, and, instead of reserving it for Bayreuth in subsequent years, give it over to the managers, at least two-score would send in their offers on the first day. But this was not so before 1876.

One important consequence of the festival of 1876 has been that, whereas previously good Wagner singers were rare, they are now to be heard in every city, and it can be seen at the present rehearsals that Wagner has much less to suggest and correct than six years ago. A single hint often suffices to render easy a passage previously considered almost unsingable; and when we consider that without these hints there would have been no traditions as to the correct manner of singing Wagner's latest works, one cannot be sufficiently thankful that the idea of Bayreuth was realized. At the same time it remains doubtful if Bayreuth will ever become what Wagner intended it to be—a dramatic high school at which vocalists may meet every summer for practice in the new style. My private opinion is that he will not be able to resist the tempting offers for "Parsifal" that will soon be made to him by various managers; and that the next Bayreuth festival will not take place until his new drama, "The Victor," or "Buddha," as it is variously called, is completed.

"Parsifal" will be of interest not only from its intrinsic merits, but as a complement to "Lohengrin." Many admirers of this first grail tragedy have often wished to know something more about the abode of the Knights of the Holy Grail from which *Lohengrin* was sent to succor the unhappy maiden *Elsa*, in accordance with the mission of these knights. In "Parsifal" this wish will be fully gratified, as its hero is the father of *Lohengrin*, with whose adventures and temptations it deals. In his 'Thematic Guide Through the Music of Parsifal' Hans von Wolzogen protests against the current notion that Wagner's dramas are based on the mediæval poems of Christian authors. The germs of the various legends which Wagner has used came to Europe through the Aryan migrations from Asia. They were adopted by the mediæval poets and dressed as epics in the manners and customs of their own time. The legend of "Parsifal" was introduced into Germany from France by Wolfram von Eschenbach, whose poem throughout shows the influence of Chrestiens de Troyes's "Conte du Graal." Wolfram's "Parzival" is called by Johannes Scherr the first great work of German idealism, and is placed by Vilmar as a psychological epic side by side with Goethe's "Faust"—a psychological drama. With Wolfram's poem Wagner's has many features in common; but it avoids all the epic details, and with genuine theatric instinct combines its most dramatic features with different versions by other poets; the result being a work of much greater unity and poetic value than that of any of its predecessors. It would be interesting to compare these different versions with one another did space permit. As it is, I can only say that Wagner retains the old Spanish signification of the word grail (or gral), a cup, and namely, the cup that was used at the Last Supper and subsequently received the crucified Saviour's blood; whereas in Wolfram's poem the grail is a sacred stone, which was given into the care of Titural and his pious knight on the Mount Monsalvat, which is inaccessible to sinners. For the much-disputed word Parsifal (Parzival, Perceval,

Peredur) Wagner adopts the interpretation of Görres, who derives it from the Arabic Parsch-Fal, *i. e.*, the pure or guileless fool.

BISMARCK AFTER THE CRIMEAN WAR.—I.

BERLIN, July 12, 1882.

THE second volume of the book 'Prussia in the Bundestag' has made its appearance much sooner than had been anticipated. It comprises the years 1854–1856, and is chiefly devoted to the Eastern war and its consequences for the Prussian policy. While in the first volume we made the acquaintance of an able young ambassador, who had to fight his way with subaltern characters and to contend with comparatively insignificant diplomatic trifles, in the present one we meet a prominent statesman, who, although behind the scenes, plays an important part on a large historical stage. The stagnant Federal Council was as dull and of little account as ever; it was, as Bismarck expressed himself, like a mill which clacks a great deal, but makes little flour, and the road to it was a very sandy one, on which the Ministers wasted their strength in vain. The necessity of reforming the Diet was everywhere felt; but as to the ways and means by which such an object should be accomplished, confusion and embarrassment ruled supreme. Bismarck was the only Minister who had formed firm convictions and settled plans to effect a radical change in that rather superfluous body, but he did not think it practicable to put the ball in motion just at that time.

It was when the present volume opens—viz., toward the end of 1853—that the petty routine of the Diet was stirred up by the Eastern entanglement, and that Bismarck found occasion to try his hand in larger political questions. In his letters he is as vivid and provoking as ever. They abound in good-humored attacks, sharp criticism, and benevolent sarcasms on his colleagues. "All the diplomatists except myself," he writes on February 28, 1855, "are highly satisfied with the news that Prokesch has been recalled. I do not consider his successor, Rechberg, as bad in his political aims, but more able and more energetic." The Austrian Secretary of State, Count Buol-Schauenstein, paid a flying visit to Frankfort to receive the homages of the Ministers accredited there. At his invitation they all went to see him with the sole exception of Bismarck, who characterized the Austrian Secretary as follows: "I wish that only for one hour I could be what Buol thinks himself all day, for then my glory before God and man would be firmly established for all time to come." It must have been a fine collection of diplomatic mummies at the Frankfort Diet, at least as depicted by Bismarck: the English Minister, a sportsman who cared for nothing but riding and fishing; the Frenchman, also a horseman and sportsman, whose time was solely occupied by these noble passions; the Austrian, a conceited fool; and the *dii minorum gentium*, irresolute ninnies. It is only against the Austrian ambassador that a bitter malice pervades Bismarck's remarks, who is stung by his colleague's stupid arrogance, and with the sharpest repartees pays back what he has to swallow. On another occasion the French Minister at Berlin, the Marquis de Moustier, blamed Bismarck's conduct and policy in the Crimean war: "It will lead you to Jena," the Frenchman said; whereupon the German answered: "Why not to Leipzig or Waterloo?"

But all these rebukes, animosities, and hostilities were tempests in a teapot, in comparison with the threatening aspect of public affairs. It is not my province to sketch the Crimean War, the less as its details do not fall within the range of Bismarck's activity. Suffice it, therefore, to say that Prussia's policy during that whole time was weak, vacillating, and unsatisfactory to all parties concerned. The irresolute King wavered from one side to the other: to-day opened negotiations with the Czar of Russia, who considered him as a mere tool, whose opinion it was not worth while asking for, and, alluding to his love of champagne and his old-womanhood, contemptuously nicknamed him "Veuve Clicquot"; to-morrow trying to come to terms with England, who did not trust him. At another time he feared and at the same time despised Louis Napoleon as an adventurer, and then again he distrusted Austria. By some of the other Governments, also, gross blunders were made. Austria, for instance, was not at all better, but she had a policy of her own, and changed her position and aims with more outward decency and pretence. Berlin at that time was a nest of intrigues between the Russian and Franco-English adversaries. Even high officials betrayed state secrets to the parties which paid well for them. Sebastopol would not have been taken so soon if the French Minister at Berlin had not bought the Russian reports representing the weak state of that fortress in the Emperor of Russia's own words. There were two parties striving for triumph in the immediate surroundings of the King—Bunsen, who stood up for the English view of the war and a quadruple alliance against Russia, and General Gerlach, who was an enthusiastic admirer of Czar Nicholas, and wanted to win Frederick William IV. over to the Russian side. Aside from these influences, Bismarck peremptorily demanded that Prussia should keep aloof from any connection with the ambitious schemes of Austria, and he finally succeeded in having her wooings rejected by Prussia. The only man, therefore, who saw clearly in these matters was Bismarck.

It cannot, accordingly, be wondered at that under such circumstances a general contempt of the Prussian policy prevailed in Europe. After the war she stood isolated, and was looked down upon as a second-rate power, whose friendship was considered of no importance whatever. Bismarck's relations to the Crimean War begin toward the end of 1853, when Austria and Prussia had concluded a treaty (afterward not carried out) by which they guaranteed to each other their non-German provinces, and for which they both wanted the consent and accession of the Federal Diet. Bismarck was opposed to this policy from the beginning. He by this time had learned enough of overbearing Austria, who not only wanted the support of Prussia for carrying out her own plans against Russia, but at any moment was ready to throw the weight and burden of the war on Prussia. "What interest have we," he reasoned, "to act as policeman for Austria? What extraordinary service has Austria rendered us to make us respectfully follow her tracks? Is it to reward her for having discredited us with the smaller German States, or trumpeted to the world that the Emperor Francis Joseph is master of Frederick William IV., and leads him wherever he pleases? If Austria wants to pick up a war of conquest against Russia, let her do it at her own expense. We have nothing to defend at the mouth of the Danube, and had better keep away from her ambitious quarrels." What Bismarck positively wanted to accomplish was not the acquisition of a larger or smaller tract of territory, but, after the conclusion of peace, such relations to the European Powers that he could arrive at a plain settlement with Austria, which for him meant as much as her exclusion from the Confederacy.

His views are fully given in a letter which, on April 26, 1856, a few weeks after the conclusion of the Paris peace, he addressed to Herr von Manteuffel, then Secretary of State. At that time Louis Napoleon was at the height of his power; all Europe flattered and courted him, or offered him alliances. Prussia was diplomatically more humiliated than (from a military point of view) by Jena. The following letter forms a terse review of past events, and gives a clew to the next ten years of Prussian policy and European history. I am bound to give its principal parts in full, as I should not do justice to its strength and vigor if I were only to epitomize it:

"There is very little confidence in the preservation of the peace just concluded," he says, "and all the Cabinets of Europe regard the near future with a certain discomfort. Great and small are trying to preserve the amity of France, and the Emperor Napoleon has the choice of alliances offered him. It does not seem as if the extravagant endeavors of Orloff had shaken the apple from the tree: it will fall of itself when it is ripe, and Russia will catch it. Count Buol's *acte de soumission* and Austria's ambition to become the first of the Rhenish Confederate States [an allusion to the Rhenish Confederation under the first Napoleon], provided that Prussia will be satisfied to occupy the second or third rank, have, as it appears, been received with a courteous reserve by the Emperor Napoleon. The officious *Wiener-Presse* therefore does not give up the hope of a Catholic league with France, and in the meantime praises the Voltairian Kaunitz because that statesman stood for France [with which, under Maria Theresa, he concluded an alliance]. The German middle States are, as heretofore, ready to submit to that one of the German great Powers which has the best prospect of the support of France, and to look for assistance to the latter if circumstances should make it advisable.

"England places no less value on the continuance of her good relations with France, and the wedded life of the two Western Powers, although grown a little morose, will not too hastily be divorced. A rupture would be the most expensive and dangerous alternative that could happen to both of them. The war has raised and elevated the French fleet, and in a possible conflict with Napoleon England would have to prepare herself at the same time to divide and set her forces against Russia and America. The present state of the English land force also recommends the preservation of the Western alliance, and the annoyance at 'the French peace' will at the utmost find a vent in teasing France. Louis Napoleon, on the other side, will for the present be kept in check by the state of his finances and by the apprehension of domestic difficulties. If he should force a rupture with England, he would do what he could beforehand to raise the French national feeling against 'perfidious Albion' to such a degree that all English attempts to create disturbances in France would glide off like water from a duck's back.

"It is very improbable that Louis Napoleon will begin a war merely for the sake of a war, or that he is stimulated by the conqueror's ambition. On the contrary, he will preserve peace as long as he can reconcile it with the disposition of the Army and consequently with his own security. Should he nevertheless want a war, he will know how to keep open a question which at any time will offer him a pretext not too wanton or too unjust to act upon. The Italian question is at present particularly well adapted for this purpose. The disorder of her public affairs, the ambition of Sardinia, the Bonapartistic and Muratistic reminiscences, and the Corsican fellow-countrymanship, offer a great many starting-points to the oldest son of the Roman Church. The hatred against the Italian princes and the Austrians smoothes his road, while in Germany he can expect no help from our democracy and from the princes except on condition of his having already proved his strength without them. Although the war is not so near at hand as gloomy prophets affirm, new political groups will nevertheless be formed whose importance and influence are based on the possibility of a war under a fixed constellation of alliances."

Correspondence.

A NATIONAL CIRCULATING LIBRARY.

TO THE EDITOR OF THE NATION:

SIR: Will you have the kindness to direct me to any circulating library from which, by pay-

ment of a fee, I could obtain the best standard and new books?

Why has nobody started a Mudie in this country? I find my inclination and bank-account in a constant quarrel in reference to buying many books of which if I could only obtain the examination for a fraction of their value, it would be a consummation devoutly to be wished. There are, doubtless, many others situated as I am, far from all libraries, desirous of keeping pace with the best thought of the day, yet not wishing to buy *all* the books they would like to read. I am, for example, at present greatly interested in French dramatic criticism and literature, but find the bills from my Paris bookseller running too high in the course of a year. Are there not, peradventure, three or four others pursuing the same study in reach of the long arms of the Postmaster-General, who would be glad to join together and procure such books as might be wanted, forwarding the volumes from one address to another according to a previously arranged plan? As Sydney Smith said to his Vestry, in reference to a block pavement about St. Paul's: "All you have to do, gentlemen, is to put your heads together and the thing is done."

There are a dozen volumes on the proverbs of different nations which I would give one-fourth their cost to read; the same of German pessimistic literature, etc. What can be done for us?

I am, sir, very respectfully yours,

G. M. Gould.

Peach Orchard, Lawrence Co., Ky.,
July 30, 1882.

[Such a book-club as our correspondent suggests could easily be established if any energetic person would take the lead. But that sort of thing does not do itself. It must be done, too, by one of those who are to be benefited by it. No one else will face the very considerable labor of getting up the club and then of running it. Local book-clubs are plenty in New England for the purchase of American literature and for sending it around within the limits of a town. Their secretaries will testify that it is not easy to get *and keep* their members together. To start a national club would be a more arduous undertaking, on account of the difficulty of finding out what scholars are desirous of joining it; and running it would be still harder, on account of the difficulty of getting an agreement in the choice of books. It is one thing to buy cheap books which people who pay a moderate annual fee are willing to read for amusement or desultory improvement, and quite another thing to satisfy a number of subscribers, paying large subscriptions, in the selection of costly books for serious study. If each subscriber wants a different book, there is no saving; the economy comes from two or more agreeing upon one book and being content, even if not eager, to see some of the books chosen to gratify others.

The extent of our country is not a difficulty worth mentioning. It costs very little to send a book by mail, and no more to send it from New York to San Francisco than to Brooklyn. The financial difficulty is entirely solved if enough persons can be got to combine; and, paradoxically enough, the difficulty of suiting all tastes diminishes in exact proportion as the number of persons to be suited increases. If the right man could take hold of the work, it could be made as great and as rapid a success as the Chautauqua Course and the Society for Home Studies.

But there is another way in which our correspondent may gain his object. There are various proprietary libraries in the country which allow their books to circulate widely. Take, for instance, the Boston Athenæum. For about $200 one can buy a share, without any formality of election, as one buys a share of bank or railway stock. At the present rate of interest this is equivalent to an annual expense of $6 or $7 a year. An annual payment of $5 obtains the loan of one new book and three old books at the same time. The postage would be the same as under the club system. The purchases include a large number of English and French books, but fewer German. Moreover, the Library Committee, we understand, are always ready to purchase good books which are asked for by the proprietors. Here is an organism, already established, which seems able to save our correspondent many Parisian and London booksellers' bills. The Athenæum, by the way, publishes a monthly list of its additions, which may give him some more exact idea of their character than we have space for.

We have spoken of the most noted proprietary library in the country. There are others, of less cost, which would probably furnish correspondingly less varied reading. The shares in the Providence Athenæum, for instance, cost, if we remember right, only $15, and the annual fee is $5. The supply of English books is large, about 900 volumes a year; French books, however, are sparingly purchased and by fits and starts; the older books, of less interest to our correspondent, are about 40,000 in number, and are said to be very well selected. Possibly it is the existence of these small Mudies that has prevented the establishment of anything like the great London library.—Ed. Nation.]

Notes.

A holiday volume, to be called 'Harper's Christmas Pictures and Papers, Done by the Tile Club and its Literary Friends,' and of which the size of page will be twice that of *Harper's Weekly*, will contain a wood engraving by Cole (after a painting by Vedder) measuring thirty-three by twenty-one inches.

Mr. Henry J. Morgan, Keeper of the Records, Canada, is preparing a new edition of his 'Sketches of Celebrated Canadians and Persons Connected with Canada'; and also 'The Bibliotheca Canadensis; or, a Manual of Canadian Literature.'

Close upon Mr. W. M. Griswold's author and subject index to certain German historical periodicals, comes a quite similar index ('Autoren- und Sach-register') to the *Deutsche Rundschau* from the same fertile source (Bangor: Q. P. Index). The *Rundschau* dates from the year 1874.

We have received the first instalment of Prof. Harrison's edition of 'Beówulf' (Boston: Ginn, Heath & Co.), consisting of the text, 101 pp., from the fourth edition of M. Heyne. Paper and press-work are admirable, and the editing, so far as we have had an opportunity of examining, is scholarly and accurate. A second part, to consist of a Glossary prepared by Prof. Sharp, is soon to complete the work, which will then commend itself readily to the needs of American students. We hope to be able to speak of the completed work more at length, after having made a careful comparison with the fresh collation of MS. and texts just published by Wülcker.

J. B. Lippincott & Co., the present publishers of W. H. Prescott's writings, have issued 'Leaflets' of selections from his works, made for homes, libraries, and schools by Miss Josephine E. Hodgdon. The advocates of the pueblo theory of Central American civilization will have to bestir themselves with tracts on the other side.

Chief-Justice Martin's 'History of Louisiana,' originally published in two volumes in 1827, and of late years hardly obtainable, has been reprinted in a single volume by James A. Gresham, New Orleans. It is prefaced by a very entertaining account of the author's singular character and career, by Judge William Wirt Howe; and Mr. John F. Condon adds a rather bald and informal register of events from 1815 (the close of Judge Martin's 'History') to 1861. Imperfect as the latter is, it supplements in a good many particulars the corresponding summary appended to Gayarré's 'History of Louisiana—the American Domination.' The publisher has prefixed an attractive portrait of Martin.

In the *American Naturalist* for August, Gen. Benjamin Alvord, U. S. A., discussing the compass-plant, of which he was the earliest scientific observer, makes a curious disclosure concerning the well-known passage in 'Evangeline' concerning this plant. Longfellow based his simile on information supplied him by General Alvord in January, 1847, but on his own responsibility called the plant "delicate," whereas it is even coarse and sturdy. Corrected by his informant after the first edition, the poet substituted the word "vigorous" for "delicate" in later editions. A criticism by Sir J. D. Hooker on the earlier epithet leads General Alvord to remark that "in England the first editions [of Longfellow] are most read."

It is safe to assert that a very large majority of our readers are ignorant of the existence of a National Park on Mackinac Island, Michigan; that Senator Ferry, of that State, obtained the sanction of Congress for it in 1875; and that it contains 911 acres, or about two-fifths of the total area of the island. It is already a considerable summer resort; and in the double interest of visitors and hotel-keepers, Lieut. D. H. Kelton, U. S. A., who is stationed on the adjoining military reservation, has compiled the 'Annals of Fort Mackinac' (Chicago: Fergus Printing Co.), which make agreeable reading. The historical information is considerable, and the legends are skilfully narrated. It was on this romantic island that Alexis St. Martin placed science under obligation by being shot in the stomach.

The report of the Boston Board of Health becomes annually of greater importance among documents of the same kind. That for 1881–82 records the fact that in the ten years 1872–1881 the mortality of children under five years has diminished from 42.17 to 36.75 per cent. This period nearly coincides with an unprecedentedly long exemption of the city from a small-pox epidemic, the last having subsided in August, 1873, since when, up to October, 1881, there were but twenty-seven cases and two deaths. The Board recommend revaccination of all graduates of the public schools who have attained the age of fifteen. Loss of time and consequent loss of wages are the chief motives with the laboring classes for avoiding compulsory vaccination. The report gives a unique photograph of the legs of a small-pox patient on the eleventh day—a "beautiful case." The photographer was the head nurse himself.

The Providence Public Library's *Monthly Reference Lists* for July give references for the history of Local Self-Government, particularly in this country, and for European Interests in

Egypt. Mr. Foster's notes show that he has more than a superficial acquaintance with the works and periodicals referred to.

The more recent numbers of the 'Anecdota Oxoniensia' series, now publishing by the Clarendon Press, embrace (Semitic) Rabbi Saadiah's Commentary on Ezra and Nehemiah; (Classical) the English MSS. of the Nicomachean Ethics, described by J. A. Stewart, M.A., and a collation of Nonius Marcellus, Harleian MS. 2719, by J. H. Onions; (Mediæval and Modern) 'Sinonoma Bartholomei,' edited by J. L. G. Mowat. This last is a medical glossary from a fourteenth-century MS. "Petroleum" already occurs in it, in the form "petraleum."

L. W. Schmidt sends us Parts 28–30 of the new thirteenth edition of 'Brockhaus' Conversations-Lexikon,' completing the second volume with the word *Bibelerklärung* (Scriptural exegesis). The most important articles are on mining (*Bergbau*), to which eleven pages are devoted; Berlin, fifteen pages, with a map and plates of public buildings; population (*Bevölkerung*); and Bible. Under *Berg*, a table of mountain heights for all the world is given; under Besançon, a map of the town and its environs. Other maps are of Asia, of Persia and its neighbors on the east, and of Bavaria, all colored. There are illustrations of the anatomy of the eye and of the famous iron hand of Götz von Berlichingen, which is still preserved at Jagstfeld.

—On the 5th of July, a parcel of manuscript of Poole and Fletcher's great 'Index to Periodicals,' containing the material for about twenty printed pages, was stolen from the express on its way to the printer. Imagine the state of mind of the editors! Manuscript of that kind cannot be written out from the imagination of an editor. The indexes of some periodicals might, so far as they were concerned, furnish an imperfect substitute; but the twenty pages could never be entirely replaced without going over from beginning to end all represented in the Index—over 4,000 volumes, the three years' work of some fifty coöperators. But, fortunately, while the editors were considering how much of this could be undertaken without delaying their printer too long, the manuscript was found under a street-counter, where it had been thrown by the disappointed thief.

—The third volume of Mr. Henry J. Morgan's 'Dominion Annual Register and Review' (Montreal: John Lovell & Son) is a double issue, covering the years 1880 and 1881. It is, like its predecessors, full of interesting information concerning the progress of our neighbor republic, few as are the points at which her affairs come in contact with our own. The settlement of the Fortune Bay difficulty by payment of indemnity is one of these points, and the most important during the period indicated. The great internal concern of the Dominion, meanwhile, has been the building of its Pacific railroad, and the Government contract for this, signed in 1880, was confirmed by Parliament early in the following year. The Government on the one hand brought the islands of the Gulf of St. Lawrence into telegraphic communication with the mainland, and on the other purchased the Western Union's lines in British Columbia, and now works them itself, to the great advantage of the public, it is said. It also granted a twenty years' monopoly to a company proposing to lay a cable direct from Vancouver's Island to Japan. It acquired a title to the Arctic territory adjoining British North America. Finally, on December 4, 1881, it took a census which revealed a total population of 4,324,810. Some of the subjects of legislation were the legalizing of marriage with a deceased wife's sister or deceased brother's widow, a bill for which passed the House, but was thrown out by the Senate by a very small majority (33 to 31); amendment of the functions of the Supreme Court, which is only seven years old, and is regarded with jealousy by the French Canadians; and improvement of the civil service. To this last end a commission of inquiry was appointed, and appears to have recommended the introduction of competitive examinations, as the minority opposed it. A list of appointments, by the way, large and small, Dominion and provincial, is printed by Mr. Morgan without unduly taxing his space. The chief party incidents of the year were Mr. Mackenzie's retirement from the leadership of the Opposition in favor of the Hon. Edward Blake and the death of George Brown, editor of the Toronto *Globe*. Mr. Morgan furnishes a diary of remarkable occurrences, abstracts of notable trials, and a readable summary of achievements in literature, science, and art. The literary product is not to be despised, though it is strongest in historical works like Ryerson's 'Loyalists of America,' and Rattray's (unfinished) 'Scot in British North America,' unless we admit (as Mr. Morgan does) Goldwin Smith's 'Cowper' and 'Lectures and Essays.' Marchand's translation (unfinished) of Kalm's journals of his travels in America, Gagnon's 'Chansons Populaires du Canada,' and Todd's 'Parliamentary Government in the British Colonies' are also deserving of mention. There are now no fewer than seven historical societies in the Dominion, one of the youngest, that of Nova Scotia, being perhaps the most vigorous and promising.

—A curious feature of parliamentary terminology and procedure across the border is what is called "the six months' 'hoist,'" which, in the absence of any glossary, we can only conjecture to mean postponement of a measure for that term. Mr. Morgan relates at some length an amusing incident which occurred in the House in May, 1879, when a Toronto barrister, seated on the floor, uttered "some offensive remarks" loud enough to be heard by the member for Shefford, against whom they were directed, who was then making a speech. This resulted in the barrister's expulsion from the House, and exclusion after repeated efforts to return. He accordingly addressed a note to the member and sent it in to him in these terms: "Sir—I desire to state out of the House what I stated in it: you are a cheat and a swindler." For this the writer was ultimately called to the bar of the House, and made an humble apology, with many regrets for having "infringed upon the privileges of the House of Commons of Canada"; but, in regard to the note, he said he was advised and believed that the act did not constitute a breach of the privileges aforesaid, not having been committed within the House, and not referring to any action of the member in his Parliamentary capacity. Still, if the House thought otherwise, he would apologize for that, too. The House did pronounce his spoken words a breach of privilege, but put up with his apology, not deeming it prudent to contest the point raised as to their jurisdiction over his "libellous and defamatory" communication.

—A correspondent writes:

"Hundreds of newspapers in recent obituaries of the late George P. Marsh give as the day of his birth the *seventeenth* of March. Their authorities, if we asked for them, would be found to be 'Appletons' Cyclopædia' in all editions, or 'Chambers' Cyclopædia,' or Cooper's 'Men of the Time,' or Drake's 'Dictionary of American Biography,' or other similar works, which are echoes of Appleton. In 'Johnson's Universal Cyclopædia' and Lanman's 'Biographical Annals of the United States Civil Service,' however, Mr. Marsh's birthday is set down, not as the seventeenth, but as the *fifteenth* of March; and the true date is the fifteenth. During the winter of 1844–5, Mr. Marsh and family being in Washington, it was my fortune to occupy his house in Burlington. His family Bible was daily before me, and I chanced to examine the family record, and noticed that his birth was entered as having occurred on the fifteenth of March. That date arrested my attention, and clung to my memory all the more because it was my own birthday. Moreover, I had already long kept a commonplace book, and under the heading of March 15 I then wrote, 'G. P. Marsh, born 1801.' The entry is now before my eyes. As Mr. Marsh's Bible may have perished, or may be now in Rome, its testimony regarding the first fact in his life will be welcome to those who have observed the conflict of biographical authorities."

—Mr. Quaritch has just issued a prospectus of an edition, to be published by subscription, of 'The Republic of Cicero,' reprinted from the edition of Cardinal Mai, with English translation and notes, by G. G. Hardingham, of the Middle Temple. This book, if well done, would be welcome undoubtedly to many readers, and especially to those whose old copies of Cicero's works do not include the important portions of this treatise discovered by Mai. The prospectus, however, opens with a curious misstatement, which it is surprising that Mr. Quaritch, with his wide acquaintance with books, could have let pass. The first sentence asserts that "the Latin text has never yet been published by the English press." This is an error. We have before us a copy of the Latin text printed and published in London in 1823—a reprint of Mai's edition of the year before, with his preface and notes. It contains a plate representing the nine persons who took part in the dialogue, and a facsimile of the Vatican palimpsest, both reproduced from Mai's edition. It forms a well-printed octavo volume of lvi. and 349 pages, and was published by J Mawman.

—A specimen page of text and of translation accompanies the prospectus, and we make bold to say that this is a most creditable proceeding, for no one can read Mr. Hardingham's version of this selected passage without an instant conclusion that his work is worthless, and that the schoolboy who should submit such a translation would justly deserve a flogging, or, in modern phrase, "to be dropped." His blunders render the whole meaning unintelligible. The true sequence of thought is destroyed, and the significance of special phrases lost. We can give but brief examples, but they will be sufficient. Cicero, speaking (i., § 44) of the rise of a popular tyrant, describes him as "audax, inpurus, consectans proterve bene sæpe de re publica meritos," which Mr. Hardingham renders: "Audacious and wicked men often cutting to pieces those who have deserved well of their country." In the next section, which treats of a mixed form of government, occurs the following sentence: "Placet enim esse quiddam in re publica præstans et regale, esse aliut auctoritate principum partitum ac tributum; esse quasdam res servatas judicio voluntatique multitudinis," which may be freely rendered: "It seems well that something should exist in the state preëminent and royal; that something should be determined by the authority of the chief men, and that certain other things should be reserved for the judgment and will of the multitude." Of this simple statement Mr. Hardingham makes the following complex one: "For it is best that there should be some certain person presiding over public affairs and representing regal state; another over the division of lands and collection of tribute, taxes, and the appropriation of the revenue, to be under the authority of the princes; and those pertaining to servitude, rights, and duties to be by the judgment and will of the people." We have nothing to add save that Mr. Quaritch ought to withdraw his prospectus and beg the pardon of those correspondents to whom he has sent it.

—Mr. Francis Galton has in a recent number of *Nature* (July 6) applied his method of "composite portraits" (see *Nature*, May 23, 1878) to the solution of the question why artists represent running horses in positions which instantaneous photography shows it to be impossible for them to assume. Taking the attitudes of the galloping horse, as represented in one of Muybridge's photographs, he finds that a certain group of successive positions may be selected in which the hind feet are, in relation to the body, comparatively motionless and extended to the rear, while the fore feet are rapidly altering their position. A second group may be selected in which these conditions are reversed, the fore legs being free from the ground and extended to the front. Now, in observing a running horse it is difficult to watch closely both the fore and hind legs of the animal simultaneously. Hence a mental image of the moving horse seems to be formed by combining the images of the fore and hind legs in those positions in which they most distinctly impress the retina (that is, in the positions in which their motion is slowest), without any regard to the fact that these positions are not assumed synchronously by the two pairs of legs. It is accordingly found that a composite picture formed by combining the forequarters of the horses in the second with the hindquarters of those in the first of the above-mentioned groups is not at all unlike the conventional figure of the running horse. The same writer has also (*Nature*, June 13) suggested a simple way in which the eye can verify the results of instantaneous photography. This consists in viewing the moving object through a hole in a screen behind which a second screen with a slit in it is rapidly moved by a spring. At the instant when the slit is opposite the hole the moving object is seen, and, as it is only visible during a small fraction of a second, it, of course, appears stationary. In this way views can be obtained of galloping horses similar to those with which Muybridge's photographs have made us familiar.

—Some six years ago Mr. Alfred Marks, known to our readers as the Secretary of the Society for Photographing Relics of Old London, was led to undertake a study of the St. Anne of Leonardo da Vinci. A cartoon of this subject (otherwise known as the "Holy Family") from the master's own hand is in the possession of the Royal Academy, while the Louvre possesses his painting of St. Anne and the Virgin; and it would appear from Mr. Marks's researches that Vasari, in describing the cartoon of St. Anne executed for the Servite monks of Florence, confounded these two designs. In a paper lately read before the Royal Society of Literature, Mr. Marks exhibited photographs of a number of copies or adaptations of the Louvre composition, and named others, in all some twenty; whereas of the Royal Academy's cartoon no duplicate is known. He concluded that it "represented an early stage in the development of an idea which found final expression in a work resembling the Louvre picture." He argued that it could not possibly have been executed under the circumstances mentioned by Vasari, and was disposed to identify it with one mentioned by Lomazzo as being in the possession of Aurelio Luini. It reached England in 1760, and turned up in the Royal Academy somewhat mysteriously, in 1791. The place and date of its production Mr. Marks would make Milan before the fall, in 1500, of Lodovico Sforza.

—Theological science has been so completely and so rapidly changed by the investigations of the past fifty years, that none but specialists in it can keep pace with its progress. The active clergyman and the educated layman must depend for their information upon encyclopædic works of one sort or another. It is to precisely these classes that a new 'Handbuch der theologischen Wissenschaften in encyclopädischer Darstellung' is addressed. Its arrangement is in the form of separate treatises on the accepted topics which go to make up the whole volume of theological science. The editor, Professor Otto Zöckler, of Greifswald, promises the completion of the whole work, in three volumes, before Christmas, 1883. The first half of volume i., which has already appeared (New York: B. Westermann & Co.), contains the general introduction and the beginning of the Biblical Exegesis; this subject will be completed in the second half-volume. Volume ii. will contain the history of the Church and the first part of Systematic Theology, and volume iii., Ethics and Practical Theology. The names of the authors of these several treatises, among which are those of Grau of Königsberg, Harnack of Dorpat, Cremer of Greifswald, and Luthardt of Leipzig, are a guarantee that while this traditional and unsatisfactory division of topics has been adhered to, the treatment will be based upon the latest results in all departments of inquiry. The tone of the whole will be conservative and defensive as against all assaults of unbelief. Copious references to books add very greatly to the value of each essay.

—The *Preussische Jahrbücher* of Berlin in the June number publishes an excellent article on the Panama Canal Question—viz., "Die rechtliche und politische Seite der Panama-Canal-Frage," by Dr. Rudolf Schleiden, from 1853 to 1864 Hanseatic Minister-Resident in Washington, and one of the most learned and accomplished German writers on public European and on international law. The author, having witnessed the negotiations following the Clayton-Bulwer Treaty at our seat of government, and being personally acquainted with the majority of the diplomatists and statesmen who have had to deal with the Central American question, gives a clear and exhaustive synopsis of the several stages of the proceedings, and throws much new and important light on the American and English policy in that quarter. This valuable essay, comprising only sixty-six pages in octavo, should be translated in order to make it accessible to the English-reading public.

—The disagreement of doctors is proverbial. It extends, apparently, even to Ph.D's. The general public do not care much how Greek is pronounced; still, a few old college graduates would be glad to have practice universally agreed upon, so that they should not always feel at sea when pronouncing the name of a Greek hero or goddess. But it is not to be. Hardly has a generation with much difficulty learned to say for Δημήτηρ, not Dēmētĕr, but Daymaytayr, and for Ἀθήνη, not Athēnē, but Athaynay, and for φέρητε, not fĕrētĕ, but fĕraytĕ, when M. Schweisthal, pupil of the École Pratique des Hautes-Études, proposes in his 'Essai sur la valeur phonétique de l'alphabet latin' (Paris: Leroux, 1882) to change all this, and pronounce Dĕmētĕr, Athĕnĕ, fayretay; and the *Revue Critique* says that he is right. The new Latin pronunciation was established more lately than the last-but-one Greek, as we suppose we must call it. The time for reaction against it has not yet come, but we live in dread of learning some day that Kikero is not Siseronian, and that Waregeel was not, after all, the protégé of Aoogoostoos.

THE JOURNALS OF CAROLINE FOX.

Caroline Fox: Her Journals and Letters. Edited by Horace N. Pym. 2 vols. London: Smith, Elder & Co.; New York: Harper & Bros.

THESE delightful 'Journals' are full of interest on two different accounts. Their first and most obvious charm is that they contain not exactly pictures, but faint outlines and sketches of Mill, Carlyle, Hartley, Coleridge, Sterling, and others who have left more or less mark upon their age, and of whom every one would wish to know more than we are ever likely to know. Readers, however, who take them up on account of the references which they contain to celebrated characters ought to be warned at once that Miss Fox, who put down her notes and memoranda simply for her own use, or the use of her friends, and never wrote a word which was meant to catch the public eye, was, with all her rare gifts and graces, not endowed with that peculiar talent which enabled writers like Miss Burney or Boswell to give to the scenes and conversations of every-day life a kind of dramatic vividness. Caroline Fox was certainly not a literary artist; she was not even a born reporter. There is not throughout her pages a single vivid version of any of the numerous conversations in which she took so keen an interest. She does not, for the most part, tell us what her friends said, but (a quite different thing) what were the topics they talked about. Her literary deficiencies are, however, more than compensated for by the charm which her own nature exerted over all the persons with whom she came in contact. At Penjerrick every one was at his best. The sympathetic and religious side of John Mill's character developed itself freely as in a congenial atmosphere. Carlyle seems to have got free for a moment from the tendency to identify the disorder of his own digestion with the general disorder and unsatisfactoriness of the world. Mrs. Carlyle and her husband are seen in a gayer, and certainly more amiable, aspect than that in which they have been represented to the world in some recent publications. "She plays all manner of tricks on her husband, telling wonderful stories of him in his presence, founded almost solely on her bright imagination; he, poor man, panting for an opportunity to stuff in a negation, but all to no purpose. Having cut him up sufficiently, she would clear the course. They are a very happy pair." In the company of Caroline Fox and of her family, John Sterling poured out all the stream of his bright and easily-flowing thoughts. Every one, in short, felt that Penjerrick was the home of love, goodness, and life, and accordingly brought forth all that was bright and lovable in his own character.

Hence we see Sterling in Caroline Fox's 'Journals' for the first time as he really was, and feel that we understand the answer to what must be to many people rather a puzzling riddle. What was it that made him the darling or the hero of friends in many ways so much more remarkable than himself? Hare wrote one life of him, Carlyle wrote a second, John Mill was all but writing a third; yet none of Sterling's friends could have maintained, or did maintain, that in his short existence he did any work of permanent importance. No one who looks at the writings which he has left, and which, unfortunately for his reputation, have been published, can maintain that he was a man of first-rate ability, or that he was a person of anything like genius. It were simply ridiculous to put him in the same line with Mill or Carlyle. Yet for all this he excited not only affection, but warm admiration, in the minds of friends who ought to have been no mean judges of character. The power of doing this is just as much a talent or a capacity as any other endowment, and the problem to be solved is, What was the "something" about Sterling which gave him his peculiar attractiveness? Any one of the sketches of Sterling's conversation given by Caroline Fox goes a good way to explain the character of the fascination

which he exercised over his friends. Take this passage, which is merely one out of a score:

"Sterling came and walked with us to Pennance Cave on a day as brilliant as his own imagination. Some of our subjects were the doctrine of Providential interference and the efficacy of prayer as involved in this question. His view of prayer is that you have no right to pray for any outward manifestations of Divine favor, but for more conformity of heart to God, and more desire after the imitation of Christ. He would not, however, dogmatize on this subject, but would that every one should act in this matter (as in every other) according to conscience. He views sincerity as the grand point, and a sincere, however erroneous, search after truth will be reviewed with indulgence by the Father of spirits. Spinoza is an illustrious example—a truly good, conscientious, honest man, who recognized a Deity in everything around him, but omitted in his system the idea of a presiding and creating God."

Now, the notable point in this version, or abstract, of Sterling's talk—and the same thing holds true of all Caroline Fox's reports of his conversations—is that it does not contain a trace of the "brilliant imagination" attributed to him by his friends. But it does show that he possessed certain qualities which account for the admiration he excited among those who loved him. He was clearly a man intensely interested in all the moral and religious questions of the time. He was, we take it, full of life. He easily received and reproduced the ideas which, as the expression goes, were "in the air." He shared to the full the reaction against the dogmatism which, under different forms, had characterized the orthodoxy no less than the unorthodoxy of the eighteenth century. He was one of the earliest of "sympathetic" talkers and writers who have swayed public opinion during the last forty years. He was one of the first of that class of men, much more numerous now than in 1840, who found it impossible to remain clergymen, and yet cherished feelings and aspirations very different from those which have marked "infidels" of the type, say, of James Mill. He had ceased to belong to the Church, yet he was in many ways, in character, a clergyman. There is something, in fact, almost humorous in his habit of laying down the law or dogmatizing upon matters about which he could have known no more than other people—that is to say, very little at all. There was nothing on which he had not a view, and his views were, we doubt not, expressed with the fervor of sympathy and belief, and in vivid if not in eloquent language. When to all this we add that Sterling died young, so as to leave to the imagination of his friends the power of picturing to themselves all that he might have accomplished had his life been lengthened, we can well understand why he left behind him not only affectionate regrets, which his lovableness undoubtedly deserved, but also a reputation for something like genius, to which he assuredly had no claim. "Whom the gods love die young," and the greatest blessing of youthful death is to leave with those who loved one the illusions still possible as long as experience has not given the lie to the expectations of affection. John Mill, Thackeray, and Carlyle were all, we believe, of Sterling's circle. Each of these men has shown the world what he could do, and has left his mark on the age. But, having had the opportunity of showing what they could do, they have of necessity also betrayed the limits of their powers, and did not, we suspect, leave among such friends as survived them anything like the feeling of loving admiration which surrounded with a halo the memory of Sterling.

However this may be, it is from Caroline Fox's 'Journals,' far more surely than from either the prosaic memoir of Hare or the unsatisfactory life by Carlyle, that candid readers will obtain a true picture of a man whose chief claim to be remembered lies in the strangeness of his having obtained posthumous fame without having produced any of the works, or done any of the acts, by which a place is generally gained in the memory of the world. We have purposely insisted upon the light thrown by Caroline Fox on his character, because this affords a striking illustration of the feature in her 'Journals' which will be found of most interest by ordinary readers. Of the hundreds who have read or will read them, by far the greater number will, naturally enough, value them because of the information they give us about men such as Mill and Carlyle. A limited body of more thoughtful students will perhaps find that Caroline Fox's own character is of more interest than that even of the most celebrated among the men who enjoyed her friendship. Persons who feel in this way will regret that for once the writer of a diary, and a woman whose whole soul must have been occupied with religious thoughts and feelings, seems to have been too little of an egotist to care to record much about herself. You feel Caroline Fox's charm not from anything she writes about herself, but from the way in which her nature elicited the love and confidence of all who came across her. Nor can you separate the writer of the 'Journals' from the circle in which she lived. Her father, her brother, her sister—all form part with herself of the home at Penjerrick. Quakerism was there seen in its most attractive aspect, and not for the first time won the sympathy of men who, like Mill, had but little belief in the doctrines either of Quakerism or of any other religious creed.

Indeed, the second source of interest possessed by this work lies in the thoughts which it suggests as to the relation between Quakerism and modern life. There is in this matter something strange, not to say paradoxical. In its origin, Quakerism appeared to be one of the wildest developments of the spiritual turmoil generated by the religious contests of the seventeenth century. To Cromwell, Baxter, or Bunyan, George Fox and his followers must have seemed fanatics whose eccentricities and errors brought discredit on the cause of Puritanism. Cromwell's statesmanlike largeness of mind might warn him that Quakers were no subjects for persecution or punishment; but Cromwell, or any man of Cromwell's time, would have utterly disbelieved a prophet who had foretold that the disciples of George Fox were the only Puritan sect who would be able to ally themselves with the thoughts, and to a certain extent to acquire the sympathy and share the feelings, of the approaching eighteenth century. Yet this has in fact been the case. The Calvinism of the Protector and of Bunyan is, for practical purposes, a thing of the past. Quakerism may be about to perish as a special creed; but, if it should perish, it will not have lived without having produced a permanent effect on English thought and feeling. Moreover, once and again, and notably in the case of Mill and Voltaire, Quakerism has been proved to have for men who would scarcely call themselves Christians an attraction hardly possessed by any other form of Christianity. As you consider the relation between John Mill and the "Friends" at Penjerrick, you see, to a certain extent, in a particular case, the explanation of a more general phenomenon. Quakerism had three or four points of contact or of alliance with the general spirit of the eighteenth century. A Quaker might believe—as, no doubt, many Quakers have believed—most of the dogmas of orthodox Protestantism; but every one can see at a glance that no dogma is an essential part of Quakerism in the same way in which certain doctrines or dogmas are essential parts of Calvinism or of Roman Catholicism. A Deist, a Freethinker, or a Quaker could, on different grounds, and no doubt in a somewhat different sense, agree in the belief that dogmas were not of the essence of religion. Quakerism, again, was a creed of toleration. We have almost forgotten the extent to which the philosophic and political movement of the eighteenth century was a reaction and protest against religious persecution. On this point Voltaire was not only in name, but in reality, in perfect sympathy with every Quaker. Freedom from the spirit of dogma, and the religious belief in toleration, made it specially easy for Quakers to accept the results of scientific inquiry. Robert Were Fox (Caroline Fox's father) was an investigator respected and admired by the leading scientific men of his day. Penjerrick was not the place where any voice would be raised to check inquiries into the secrets of nature. This, it must be remembered, meant a good deal more in 1835 than in 1882. Quakerism, lastly, was from the first intimately allied with humanity, and philanthropy was the real religion of the eighteenth century.

In this, more than in any other single point, lay the difference between Quakerism and Calvinistic Puritanism. The Puritans, Macaulay has taught the world, denounced bear-baiting, not because it gave pain to the bear, but because it gave pleasure to the spectators. The dictum goes a good deal nearer the truth than most epigrams. It at any rate hits one of the weak points of a creed as noble and sincere as that which inspired the 'Pilgrim's Progress.' The best of Calvinists were too much impressed both with the depravity of human nature and with the terrors of the world to come to cultivate with effect virtues, like "humanity," which, as the very name imports, are developments of the good side of man's character, or to devote themselves to the practical improvement of the world as it exists. From this fault Quakerism was free, and could therefore easily ally itself with philosophic philanthropy, which aimed at the improvement of mankind, and believed with only too confident a faith in the perfectibility of human nature. Quakerism, in short, developed exactly those features of Christianity which suit the spirit of an age of peace, of industry, and of humanity. Houses like Penjerrick were to men like Mill spiritual resting-places, where they could see Christian sentiment and faith in full sympathy with the objects aimed at by enlightened philanthropy.

Respect for truth, nevertheless, requires that we should note the fact that the paradox of Quakerism does not end with the fact of the alliance between the teaching of George Fox and the philanthropy of the eighteenth century. No one can, we think, doubt that Quakerism does not promise to become the creed of the future. Many of its peculiar tenets have assuredly been imbibed by men who could never be called Quakers. Even while the bombardment of Alexandria is, so to speak, ringing in our ears, every one who cares to reflect will admit that in England the spirit of moral Quakerism is making way among statesmen. The industrial states of the world are slowly, but surely, throwing off the liking for war derived from what may be termed military ages. But for all this, it is pretty certain that Quakerism will find difficulty in holding its own as a religious creed. Of the theological or anti-theological beliefs which may menace Quakerism, this is scarcely the place to speak. A fact more easy to deal with is, that Quakerism depends for its very existence on a condition of things which could not be produced by a body of men who honestly practised the doctrines avowed by the Society of Friends. Civilized society rests at bottom on force. You may avoid wars, but you

could never be at peace unless you kept up an army; and those who fancy they would be willing to disband the Army and the Navy hardly imagine that we could dispense with the police. Yet a constable is little else than a soldier in plain clothes. The early Christians, we shall be told, would not take part in war and lived in a spirit of Quakerism. The fact is doubtful; but were the fact granted, one may well point out that the *pax Romana* secured by the arms of Rome was almost a necessary condition for the growth and development of the early Christian Church. This account of a conversation between Caroline Fox and F. D. Maurice is at least worth the careful consideration of those who believe that a civilization built up by war, and depending for its existence on the use of force, will, or can, ultimately adopt the whole doctrine of Quakerism:

"Stumbled somehow on war. 'Won't the world some day come to think with us?' quoth I. 'They will come to think rightly,' was his reply, 'no doubt, but perhaps very differently to you or I.' 'But would any nation dare to attack another which resolves under no circumstances to do them anything but kindness?' 'Well, I find that whenever I am most right, I may always expect to be most bullied, and this, I suppose, will go on; it brings home to one very strongly the meaning of the words, "Woe unto you when all men speak well of you."'"

RECENT POETRY.

An American stage-manager said, the other day, that all the manuscript plays offered to him might be classified as translations, imitations, or nightmares. To begin our recent poetry with the nightmare class, we must give the first place to 'Cagliostro: A Dramatic Poem in Five Acts,' by Edward Doyle (New York: W. B. Smith & Co.). Here is a book written apparently with a serious purpose, and seriously dedicated by the author to his two sisters. It seems to be designed to expose spiritualism, but its wildness is so extreme as to make even spiritualist literature seem sane. To call it a nightmare is, after all, flattery; it seems like a hundred pages of *delirium tremens*. Perhaps the least crazy thing about it is the list of *dramatis personæ*, and yet this begins as follows:

"*Judge Guilderbury*—An Abraham or Jepthah.
Col. Geo. Guilderbury—A logical Materialist.
Salvation Plover—Gen. Willard's personator.
Dr. Empedocles Squigginson—A Medium and Builder of the New Motor, the Physical Savior of the Race.
Alfred Templeton—A Clergyman.
Cagliostro—The Inspirer of the New Motor and the Second Coming, and the Spirit of John Keats.
Patsy—An unprogressed Spirit and the Bishop."

—and so on. There is not much choice in the scenes, but the following perhaps is as lively as any. It must be explained that *Patsy*, here the chief performer, is based upon a spirit described in Rev. Charles Beecher's book—one who "told Professor Phelps that he was in hell and liked pumpkin-pie" (p. 41). This delicate Ariel disports himself as follows, amid a circle of the principal people in the play:

"*Dr.* Spirit, convince him—gently!
Judge (whiningly). A big idiot
Indeed! Was not the chair upon your head,
The elbow-plucking, and my fall enough?
Col. (releasing Doctor, and turning on Judge). Drunk! crazy! trash! (Patsy blows a fish-horn at the Colonel's ear, and around his neck puts a string of bull-frogs.)
Judge. Oh!
Col. You damned juggler! making
Of me a target? (Rushes at Doctor, but stops, having flour dashed into his face by Patsy, who then wipes it off with a blacking-brush.)
Judge. Blinded, like Saint Paul,
By lightning.
Plover. Flour, Judge. Colonel, give it up.
You cannot hold the cramping battery out.
(Patsy flings torpedoes at the Colonel's feet.)
Col. Hell and damnation! If all Presidents—
(Pinched on shoulders and legs alternately by Patsy, who rises to a great height, drops, and sometimes plays dog. The Colonel's rubbing and snatching with both hands on all sides become desperate, his language more and more emphatic. Plover and the Judge, in whose faces Patsy occasionally fillips beans, step about lively, and the Doctor, folding his arms, smiles.)
All Senators—all Representatives—
Chief Justices, with their associates—
Dr. He goes a-crabbing with two bursted nets."
(Pp. 46–7.)

On the whole, if there is any one who wishes to test for an hour what De Quincey calls "the pains of opium" without any of its pleasures, it can be done very cheaply by the purchase of this little book.

It seems unkind to class among the nightmares a work entitled 'Abraham Lincoln, the Type of American Genius: an Historical Romance,' by Rufus Blanchard (New York: C. L. Woodward); but could the excellent President here named have lived to read his own obituary, he certainly would have extracted some fun from it. The book is an octavo volume of 150 pages, luxuriously printed. All but about twenty of these pages are devoted to the supposed preliminaries of his birth—these antecedents comprising a survey of American colonization, of the French and Indian wars, and of half-a-dozen related families. But, as the family names are never given, and as we know the performers only as Alfred and Sarah, William and William, jr., it is very difficult to trace the genealogies. The people also change their names a good deal, and there is generally an attending chorus of fairies. The leading hero is a typical New England youth, who goes West, leaving at home his first love, described as follows:

"Grace was a child but seven years old;
Her hair was colored almost gold,
And hung in many a velvet fold,

"With bluish ribbons neatly tied,
Or curled above her forehead wide
In cowlicks, one on either side.

"Her dimpled cheeks were faintly stained
With mottlings like the lilies grained,
Which nature's varied hand had trained" (p. 27).

This was the first love; but the second was an Indian girl, whose name alone seemed to promise domestic endearments that should be sweet and very prolonged. Her father was the chief Wabunsie:

"His daughter's name was Gheezhigneenwateen,
The same who'd crossed Chicago's portage green—
The Indian lassie spoken of before,
Who, with her father, visited this shore
To see the world, like any other belle,
In trading marts where people buy and sell.
In this respect, all belles are much the same,
Of every nation and of every name" (p. 54).

The hero weds the Indian maid with the resounding name, and thenceforth this appellation flows as freely through the poem as if it were Helen or Mary. Perhaps the husband grows weary of pronouncing it, for he deserts his wife at last and weds another, who has no more sonorous name than Permilla: she is mentioned occasionally as "his distinguished wife Permilla." She is attended by supernatural visitants:

"And as she from the field withdrew,
Ten thousand fairies round her flew:
Unheard, unseen to mortal view,
As round her way they hovered.

"Outside this group of flying fays,
Two angels in the mystic maze
In silence on Permilla gaze,
As slowly she retired" (p. 123).

It is this Permilla who, if we rightly unravel the web of *dramatis personæ*, is the ancestress and guardian angel of Abraham Lincoln; and the last twenty pages are devoted to his life and death. The author of the "historical romance" is Mr. Rufus Blanchard, who has also published (at Wheaton, Ill.) several works on the history of the Northwest.

We are not passing wholly out of the nightmare class when we mention 'Esther: a Romance,' by Charles De Kay (New York: D. Appleton & Co.). We must own to finding it a very unattractive book, since it is not merely fatiguing, like the prolonged Eastern romances of Southey, but unites with this trait a certain unwholesomeness of flavor, not removed by an evident sincerity of purpose, this being evinced in the dedication, "to the great shade of Darwin and the lofty spirit of Emerson." The author asserts in his preface that "the volume, though Oriental in cast, is American in motive"; but this motive is hidden so deeply that it is rather difficult to find. The metre has a certain character of its own, the long, eight-lined stanzas being rather pleasingly relieved by a sort of tag or appendix of two short lines at the end of each, somewhat resembling those introduced by Halleck in each verse of "The Field of the Grounded Arms." It is fair to say that Mr. De Kay's long poems are less whimsical than his short ones, and that this volume is less wayward and more readable than its predecessor, 'The Vision of Nimrod'; and, possibly, the third vision which he promises—that of 'Abram'—may, like the third olive, create the required relish in the consumer.

But why cannot our American bards give us narrative poems which shall be attractive as well as imaginative, like the new volume of Irish legendary poems by Aubrey de Vere? There can be no more discouraging material, to the ordinary reader and in ordinary hands, than the old Irish traditions; they are thought as unpromising as Old-Testament themes or those founded on the American Indians. But in the hands of Aubrey de Vere they become at once heroic and graceful, full of striking deeds and tender and poetic fancies. 'The Foray of Queen Meave, and Other Legends of Ireland's Heroic Age' (London: Kegan Paul, Trench & Co.), is a volume which holds and enchants the reader, however incredulous as to the past glories of the Green Isle; and those who have looked with wonder upon the unprinted masses of early Irish literature in the library of Trinity College, Dublin, must be glad of anything which does justice to the spirit of an almost forgotten civilization. "The Foray of Queen Meave" is no doubt the most powerful of these fragments; but "The Children of Lir" is the tenderest and most touching—a legend of four royal children, transformed for nine centuries into wild swans, and relieved from their doom only by the coming of St. Patrick, whose first converts they were. The same legend has been rendered into prose by Professor O'Curry, and other tales of the same class have been handled with well-known success by Sir Samuel Ferguson.

'The Book of the Dead,' by George H. Boker (Philadelphia: J. B. Lippincott & Co.), might almost have been classed among the nightmares in respect to its painful qualities. The author's aim seems to be to do for vengeance what Tennyson did for friendship and Petrarch for love; and he chants its various aspects through a hundred poems. But the effect of such a volume is to make it seem more dangerous to be a friend of Mr. Boker's than an enemy; for the nameless enemy does not suffer, while the book for the first time reveals to us that some one near and dear to Mr. Boker has been subject to grievous imputations. Is it not better to let those charges rest under death's seal of silence?

In 'A Prairie Idyl, and Other Poems' (Chicago: Jansen, McClurg & Co.), we find no such painful demonstrations, but an innocent tale marked by the great merit of local coloring. The author does not sing of the skylark, as even Mr. Aldrich did the other day, but his scenery and properties are all of the prairie. Why is it that, when thus faithful in regard to external nature, he should still have that habit which lends a false note to so much Western poetry,

and should give high-flown names to his personages? If he wishes to make a poem about croquet, it is very well; but why should not the performers be plain James and Anne, instead of Roland and Christabel? We note, also, that he has borrowed the title of a poem from one by "H. H.," and has called it "Love's Largess." In 'A Red-Letter Day, and Other Poems,' by Lucius Harwood Foote (Boston: A. Williams & Co.), we have also some good local coloring, East and West, but this writer, too, gives us too much of Ginevra and Floribel. Tried by this same standard of local coloring—a standard which it is essential to apply to every national literature in its dawning—we find Mr. George Houghton's 'Niagara, and Other Poems' (Boston: Houghton, Mifflin & Co.) far more attractive than his Norse epics; we find Harriet Paine's pretty and skilfully-imitated 'Bird-Songs of New England' (Boston: A. Williams & Co.) to outweigh a library of sonnets on the nightingale; and Mr. Chas. H. Phelps's little volume of 'Californian Verses' (San Francisco: The Californian Publishing Co.) to be worth many such labored poems on exotic themes as Mr. Nowlan's 'Eadburga, Queen of Wessex' (Boston: M. H. Keenan). Not that an American poet need confine himself to home material, but he shows a want of poetic instinct when he fails to recognize its value. When it comes to aboriginal Indian subjects, they are hard to deal with, no doubt, but Mrs. Martha Perry Lowe has certainly added new interest to Chief Joseph's oft-told tale by her versified narrative, with its well-chosen illustrations ('The Story of Chief Joseph': Boston: D. Lothrop). Nor would we churlishly deprive young poets of those universal themes of passion which scarcely need a local setting; themes that are handled with some real feeling and with some strains savoring of affectation in 'The Life of a Love, in Songs and Sonnets,' by N. M. Sedarté (New York). There is a good deal of Rossetti in this thin volume, but there is power and promise also. In 'From Daybreak to Twilight,' by Charlotte H. Coursen and Edith R. Crosby (New York: G. P. Putnam's Sons), there is much true feeling, with a simplicity and smoothness that afford pleasure, even if they do not promise much more.

It is long since any volume by a wholly new poet has been marked by a single poem so strong and concentrated as "The King's Musketeer," in 'The Defence of the Bride, and Other Poems,' by Anne Katharine Green (New York: G. P. Putnam's Sons). The verses from which the volume takes its title have something of the same vigor, and their more sing-song measure might make them more attractive for recitation; but they are far more melodramatic and less original in plot. "The King's Musketeer" tells its story tersely and powerfully, and is as absolutely objective as Browning. The author's taste inclines to strong situations, based on the incidents of war, and her verses are rarely open to the charge of tameness. Nor are the verses of Mrs. Blake tame—'Poems by Mary E. Blake (M. E. B.)': Boston: Houghton, Mifflin & Co.—but they are quite unlike the dramatic and martial strains of Mrs. Green, being, indeed, mostly domestic and thoughtful, and celebrating the charms of children, especially, in a very wholesome and motherly way. There are some poems suggested by the War for the Union, also, which thoroughly represent the wife's and mother's side; and it would not be easy to find that aspect of the war more stirringly touched than in her "Waiting for the News." She is evidently a Roman Catholic, and her volume is a good refutation of the delusion of those who still think that to be Roman Catholic is necessarily to be un-American.

The volume of Bret Harte's collected 'Poetical Works,' including the drama of the "Two Men of Sandy Bar" (Boston: Houghton, Mifflin & Co.), revives the yet unsettled problem of his place in literature, and makes the reader wonder, as he examines the thick volume, how much of commonplace can be permanently kept afloat by four or five strong and original poems. Most of the pages of this volume, read at a distance of some years from their first appearance, leave that bad taste in the mouth of which Charlotte Brontë complained in French novels; and the inclusion between the same covers of the heavy and vulgar drama leaves the memory of the reader filled to repletion with coarse and vicious personages, almost unrelieved by anything cleaner or more refined. And these repulsive figures are so dear to their author that they threaten to eclipse all the others he has created, and leave room for doubt whether his reputation in his own land will really be more solid and lasting than that of "Joaquin" Miller.

Among recent English publications, we note a dainty volume, 'Songs and Rhymes, English and French,' by Walter Herries Pollock (London: Remington & Co.). Mr. Pollock is the younger brother of Hon. Frederick Pollock, well known through his 'Spinoza' and 'Leading Cases'; and the poet himself is known as a journalist, and as the joint author of several volumes of fiction, whose authorship he shared with his accomplished mother, Lady Pollock. We are constrained to say that there is a stronger touch in his prose than in his poetry, the latter consisting mainly of agreeable *vers de société*, and rarely rising beyond that level. Yet there is certainly much of concentrated power in this brief dramatic summary:

"A CONQUEST.

"I found him openly wearing her token;
I knew that her troth could never be broken;
I laid my hand on the hilt of my sword,
He did the same, and spoke not a word.
I bade him confess his villainy;
He smiled, and said: 'She gave it me.'
We searched for seconds; they soon were found;
They measured our swords and measured the ground;
To save us they would not have uttered a breath;
They were ready enough to help us to death.
We fought in the midst of a wintry wood,
Till the fair, white snow was red with his blood:
But his was the victory, for, as he died,
He swore by the rood that he had not lied" (p. 60).

A delightful book is 'A Garland from Greece,' by George Francis Armstrong, M.A. (London: Longmans, Green & Co.). It has in it more of the flavor of the Orient than any volume of poems since Lord Houghton's 'Palm Leaves.' Its author is one of two brothers—Irishmen, if we mistake not—who have published a good many volumes. A large part of the merit of this work lies in the choice of subjects, but the treatment is very vigorous, and the "Brigand of Parnassus" and "Last Sortie from Mesolonghi" are especially fresh and fine. There is a poem on "The Satyr" which was perhaps suggested by Maurice de Guérin's fine description of the Centaur, and is worthy to be read in connection with it. There is also one poem which is not of Greek origin, but has an extraordinary depth of analysis and emotion; it is entitled "Time the Healer."

But, after all, not one of these books of poetry, whether English or American, has the interest that attaches to the little volume which bears to us the last poems of Longfellow, 'In the Harbor; Ultima Thule—Part 2' (Boston: Houghton, Mifflin & Co.). This interest lies not so much in the total poetic contents of the book—for these, in truth, are very unequal—as in the few closing poems, grouped together as "personal." Scarcely ever in his whole series of publications has Mr. Longfellow brought us so near to himself. There is here a strength of touch and a meditative depth which make these closing sonnets a key to the very heart of the writer. "My Books" sets the poet face to face with the fact that his day of productive work is over; in "Victor and Vanquished" he looks death itself in the eyes; and in the closing poem (dated January 17, 1882) he transfers his work to some bard of the future, in a strain as sweet and noble as ever closed the music of an earthly harp:

"POSSIBILITIES.

"Where are the poets unto whom belong
The Olympian heights: whose singing shafts were sent
Straight to the mark, and not from bow half bent,
But with the utmost tension of the thong?
Where are the stately argosies of song,
Whose rushing keels made music as they went
Sailing in search of some new continent,
With all sail set, and steady wind and strong?
Perhaps there lives some dreamy boy, untaught
In schools, some graduate of the field or street,
Who shall become a master of the art,
An admiral sailing the high seas of thought,
Fearless and first, and steering with his fleet
For lands not yet laid down in any chart."

ELLIS'S FIRST CHURCH IN BOSTON.

History of the First Church in Boston, 1630-1880. By Arthur E. Ellis. With an introduction by George E. Ellis. Illustrated. Boston: Hall & Whiting.

THIS work is the enlargement of a lecture pertaining to the celebration of the 250th anniversary of the organization of the First Church in Boston. An introduction, in the nature of an essay, by Rev. Dr. George E. Ellis, fills seventy-two pages, and treats of the founding of the Puritan church and the Puritan commonwealth, of the legal obligations binding together the church and the commonwealth, and of the social ties which were the bases of church government. Dr. Ellis is also to be credited with the direction and supervision of the entire work, "from beginning to end." Under such able direction, it could not be difficult for Mr. Arthur Ellis to produce an interesting book. Since its gathering in 1630, the First Church has had seventeen settled ministers. John Wilson, John Cotton, John Norton, John Davenport, James Allen, John Oxenbridge, Joshua Moodey, John Bailey, Benjamin Wadsworth, Thomas Bridge, Thomas Foxcroft, Charles Chauncy, John Clarke, William Emerson, John L. Abbot, Nathaniel L. Frothingham, Rufus Ellis—all eminent for piety and learning, and some, in their day, the absolute controllers of the religious thought of New England—make up the shining roll of its pastors and teachers. The lives and actions of these ecclesiastics are described by Mr. Ellis with fair particularity. Necessarily, he has made use of the works of previous historians, such as Winthrop's Journal and Emerson's 'History of the First Church,' brought down to 1811, and for his indebtedness to these he makes acknowledgment without stint. The illustrations consist mainly of portraits of the clergymen (presumably of all procurable), and views and plans of the notable church buildings.

The first meeting-house of the society, erected in 1632, was on the plot of ground now covered by "Brazer's Building" in State Street. Its cost, with a parsonage, is set down at £120. In 1640 the house had become too small for the accommodation of the congregation, and a new one was put up on the lot where the "Rogers Building" now stands, in Washington Street, the actual cost being £1,000. This was destroyed by a fire "occasioned by the carelessness and intemperance of a strange woman" in 1711, for half a century afterward called the "great fire," as it swept away the finest part of Boston. From the ashes of the second church grew the famous "Brick," finished for occupancy in 1713 at an outlay of £3,849 8s. 1d. Nearly a century later (in 1808) the society removed to the corner of Summer and Chauncy Streets, and once again, in 1868, to the corner of Berkeley and Marlborough Streets; the existing edifice, the charges upon which amounted to $325,000, being justly regarded as one of the sightliest in the city.

Very serious were the controversies which disturbed the church through the first fifty years of its existence. Matters which, at this time, would not furnish an item for a busy newspaper reporter, to the eyes of the fathers of the colony assumed an appearance of awful importance. The Hutchinson controversy, resulting in the excommunication and banishment of several of the leading members of the church, serves to make up one of the most interesting chapters in the history of the Massachusetts colony. It shook Church and State to their very foundations; and yet, when one has read everything that has been written about it, he may still be wholly in the dark regarding what it was all about.

Only one case of witchcraft is recorded as occurring within the First Church. In 1657 Mrs. Anne Hibbins was tried, condemned, and executed for this crime. She was the widow of William Hibbins, one of the most serviceable magistrates of the colony. Mr. Norton, her minister, is reported to have said that she "was hanged for a witch only for having more wit than her neighbors; she having unhappily guessed that two of her persecutors, whom she saw talking in the street, were talking of her, which, proving true, cost her her life." All Mr. Norton's efforts to save the life of the poor woman were unavailing. At a later day Mr. Moodey appears to have met with some creditable success in setting free two accused Salem witches. Philip English, a worthy merchant, and his wife, an amiable, well-bred woman, inhabitants of Salem, were accused of witchcraft and lodged in the jail there, but for some reason or another were afterward removed to the Boston jail. The rest of the story is thus told by Mr. Ellis:

"Moodey was in Boston at the time, and determined to set them free. With this purpose in mind, he invited them to the church, and preached from the text: 'When they shall persecute you in one city, flee to another.' Following up his sermon with some wholesome advice of a more private nature, he finally induced them to make good their escape. The service which Moodey performed on this occasion was gratefully remembered by the descendants of English in after days, but at the time, so great was the displeasure which his conduct created, that it is said to have caused his removal from Boston back to Portsmouth."

Such evidences of "church discipline" as are afforded by the records "are fitly left where they are, perhaps in the interests of historical fidelity claiming a right to be preserved in manuscript, but with no warrant to be reproduced in print." We do not question the propriety of keeping out of print the record evidence of "grievous lapses from decorum and morality," and yet when, some pages further on, we read that from 1653 to 1656 there were "three males excommunicated for the sins of drunkenness and adultery," we can but wonder what stories the records could tell that must be "fitly left where they are."

A lesson in political economy may be gathered from the case of Robert Keayne, a merchant of wealth and position, the founder and first commander of the Ancient and Honorable Artillery Company. Keayne was "admonished by our pastor for selling his wares at excessive rates, to the dishonor of God's name, the offence of the General Court, and the public scandal of the country." This was an occurrence of 1639. Mr. Keayne had been fined by the deputies £200, and by the magistrates £100, but the last sum only was paid. When brought before the church for admonishment—(some of the members were urgent for his excommunication)—Mr. Keayne set up a partial defence, which gave Mr. Cotton an opportunity to expose the "false principles," and to give some "rules for trading" applicable thereto. Among the "false principles" we find:

"1. That a man might sell as dear as he can, and buy as cheap as he can. 2. If a man lose by casualty of sea in some of his commodities, he may raise the price of the rest. 3. That he may sell as he bought, though he paid too dear, and though the commodity be fallen. 4. That as a man may take the advantage of his own skill or ability, so he may of another's ignorance or necessity."

And these were the "rules for trading":

"1. A man may not sell above the current price—*i.e.*, such a price as is usual in the time and place, and as another, who knows the worth of the commodity, would give for it, if he wanted it; as that is called current money which every man will take. 2. When a man loseth in his commodity for want of skill, he must look at it as his own fault or cross, and therefore must not lay it upon another. 3. Where a man loseth by casualty of sea, or, etc., it is a loss cast upon himself by providence, and he may not ease himself of it by casting it upon another; for so a man should seem to provide against all providences, that he should never lose; but where there is a scarcity of the commodity, then men may raise their price; for now it is a hand of God upon the commodity, and not the person. 4. A man may not ask any more for his commodity than his selling price, as Ephron to Abraham, the land is worth thus much."

Mr. Ellis's view of the noted persecution of sectaries—Quakers, Baptists, etc.—is not an impartial one. He presents it as follows:

"The form of government attempted to be established by the colonists recognized not only the right, but the obligation, to ward off 'erratic spirits.' The laws of the colony were framed so as to keep 'police order' in religion. They recognized no distinction, save in kind, between religious and civil offences. In either case the offender might be fined, imprisoned, banished, whipped, put in the stocks, or hung. That our fathers made prompt use of these means of enforcing discipline, the records will amply testify. No punishment was too severe for the religious offender. They were especially violent in their opposition to the Quakers and Baptists. We have seen how far his zeal in this direction carried Norton. He was instrumental in, if not directly responsible for, the execution of the Quakers on Boston Common, through the violence of his attack on what he called their blasphemous beliefs. But while we do not defend the course they pursued, we must be careful not to judge men like Norton too hastily. Harsh as their conduct was, we generally find some excuse for it in the extremely exasperating behavior of those with whom they had to deal. The Quaker spirit of that day was very different from the temper of the modern Friend. Those who were called Quakers then would scarcely be recognized by that name today. Their nature was aggressive, and they courted persecution. Some of them reviled the magistrates, calling them 'just asses'; and others, under pretence of prophesying, appeared in public without clothing, or simply wrapped in sheets, with their faces smeared with black paint, like demons denouncing direful judgments on the colony. Such exhibitions were dangerous as well as repulsive, and well calculated to shock the nerves of sensitive people. The perpetrators had to be put down. If those who performed the task betrayed any undue zeal, we must bear in mind the perversity they encountered and the strict line of conduct they felt bound to pursue in dealing with it."

In how different a vein writes the Rev. William Emerson ('Historical Sketch of the First Church') when dealing with the same subject. He finds the persecutions "altogether unjustifiable on any principle of the Gospel or of common humanity. . . . The most unrighteous laws stared them [the Baptists] in the face; and the most villainous conduct was secretly practised to their mischief. This treatment of the Baptists was comparatively trivial to what the poor Quakers endured. They were subjects of reproach, scorn, buffeting, scourges, torture, and death. They were stripped of the clothes they wore, and robbed of the beds whereon they lay." Mr. Ellis says that "the perpetrators had to be put down." The perpetrators of what? Of calling the magistrates "just asses"? or appearing "like demons denouncing direful judgments on the colony"? The "dangerous and repulsive" exhibitions are mentioned by Mr. Ellis too indefinitely for direct contradiction. If they happened at all, they were the happenings of a time subsequent to the hanging of the Quakers, and subsequent to the death of John Norton. And we nowhere can find evidence that Norton was "directly responsible for the execution of the Quakers on Boston Common," or that he was "instrumental" to a greater degree than his fellow-clergymen, the magistrates, and the chief people. The powers had decreed that the Quakers "must be put down," and the cruel laws were passed and cruel punishments inflicted before the publication of Norton's 'Heart of New England Rent,' to which Mr. Ellis evidently refers when saying, "We have seen how far his zeal in this direction carried Norton." Wilson and Mitchell were even more violent than Norton "in their opposition to the Quakers."

Is it true that "the Quaker spirit of that day was very different from the temper of the modern Friend"? The question will admit of argument. It is mentioned as an interesting fact, and "highly creditable to the Christian temper of the Quakers of Dublin and vicinity, that, forgetful of injuries, they contributed liberally to the relief of the inhabitants of New England at a period of great public distress" (Mass. Historical Society Collections, 4th series, vol. viii., p. 56). In Increase Mather's diary the arrival of the vessel "sent by the Quakers in Dublin for those that were impoverished by the war here," is mentioned under the date of November 25, 1676. Another interesting fact, not to be overlooked here, is that at that very time the persecution of the Friends in New England was rigorously pursued. In 1677—to be particular, on the 4th of July—nine men and three women (Quakers) were arrested and whipped for no other cause than that of engaging in religious devotions at their ordinary place of meeting. Our local histories furnish convincing evidence that the "Quaker spirit of that day" was very similar to the "temper of the modern Friend"—that it was charitable and forgiving, even to an extreme degree.

From strict Calvinism the First Church gradually developed into Unitarianism, but the change was wrought without noticeable disturbance, and in these latter days it has enjoyed external as well as internal peace, and has taken the lead in many charitable works that greatly redound to the credit of the city. "Another century is yet before it."

Three in Norway. By Two of Them. Philadelphia: Porter & Coates.

THE incidents of a ten-weeks' fishing and shooting expedition are rather amusingly told in the neat volume before us, and every lover of camping-out life must delight in following the three young Englishmen to the Jotun-fjeld. In this wild and picturesque region they pitched their tent by lake Gjendin, some 3,000 feet above the sea, surrounded by the glaciers of the grandest mountains in Norway, and were only driven from their sport by the approach of winter, early in September. The trout-fishing in the lake and its outlet, the river Gjendinoset, was all that could be desired, and was particularly excellent at the time of the advent of the "Gjende-fly," an insect evidently more agreeable to the fish than to man, if we may believe the following description:

"The Gjende-fly has come, and he is only a wretched little black beast, like a very small, unenterprising, common or garden house-fly of Great Britain. He cannot fly decently; he is apparently devoid of sense; he has no moral, physical, or intellectual attributes for which a human being can learn to respect or love him; but—he *can crawl*. If he alights on the water,

it never occurs to him to rise again, and he allows the trout, mad with the excitement of a fortnight's prospective gluttony, to scoop him down their capacious throats by companies. If he enters your mouth, which he does with a numerous retinue every time you open it, retreat from that untenable position is the very last thing he would think of ; and with what may be a gleam of momentary intelligence he seems desirous of still further increasing his knowledge of the rest of your interior arrangements."

"If any one stuck up a rod near the river, in two minutes it looked like a black fir pole with a bunch on the top ; and John, who is a man of great entomological knowledge, spent some time in studying this phenomenon. He reported that the flies crawled up for fun, intending to jump off the top ring, but when they got up it was so much higher than they expected that they were all afraid to try, and those at the bottom and half-way up kept jeering at the top ones, and calling them names, and jostling them so much that they could not crawl down again. He also said that the swarm in the air was so dense that he wrote his name in it with his finger and it remained visible for nearly a minute."

"Probably it is difficult for a man to speak the exact truth with his mouth full of (f)lies."

The shooting was likewise excellent, and, with the help of Öla, the Norwegian guide, some successful reindeer-stalking was accomplished. The reindeer is almost the only inhabitant of the high mountain regions during the greater part of the year ; but during the summer months the cattle are driven to pasture at the "sœter" or mountain-farm, accompanied usually by one or two young girls, who remain to take care of them and drive them down again in the fall. The primitive simplicity of the people is well illustrated by the following extract :

". . . We pulled up at the door of a large sœter. Without knocking, Jens opened the door, and we walked in and struck a light. There was the usual fireplace and table, and in the further corner a bed, which, as we presently perceived, was occupied by two girls. This discovery embarrassed us a little ; but no one else, least of all the girls themselves, appeared to be at all disconcerted. . . . The elder one at once got out of bed and proceeded to dress, while her sister remained where she was, and soon fell asleep.

"When the dressing commenced, we, being innocent young bachelors, retired and remained outside till it was finished; but we do not believe she appreciated our delicacy at all.

"Then this poor girl, no doubt very tired after a hard day's work at cheese-making, proceeded to relight the fire, prepare coffee, and broil some venison for us. And just as we finished a hearty meal, Öla and Ivar arrived, so that she had to begin all over again for them. Finally, in spite of our remonstrances, she dragged her sister out of the bed, and insisted on our having it, while they went and slept in another building a few yards away. So John took the bed they had vacated, while Esau made a couch for himself in the cheese-room, and we slept the sleep of the hard-worked, virtuous, penniless wanderer.

"Verily, they have a better idea in Norway of true hospitality than in any other country under the sun."

The rich old farmer of Björlstad, with his "aquavit," is also a good specimen of Norwegian hospitality ; but we must refer those who wish to make his acquaintance to the book itself, which will be found very pleasant summer reading. It has a map of the Jotun fjeld and numerous woodcuts, and its appearance is very attractive.

The Stolen White Elephant, etc. By Mark Twain. Boston : James R. Osgood & Co. 1882.

This volume contains most of Mr. Clemens's recent humorous contributions to the magazines, some of which are very well known, such as "Punch Brothers, Punch," "The Facts concerning the Recent Carnival of Crime in Connecticut," "On the Decay in the Art of Lying," "An Encounter with an Interviewer." "The Stolen White Elephant," which gives its name to the book, is a very elaborate piece of satire at the expense of the detective force of this city. In looking over the volume, the reader is struck with the fact that Mr. Clemens's humor is of such a universal and comprehensive character that it is very difficult to say in what its peculiarity consists. His eminent forerunner, Artemus Ward, had a certain literary *cachet* which Mr. Clemens lacks. His sketches were sketches of American life and manners, grotesque and absurd as you please, but still having a distinctly national flavor. It is hardly possible to say that Artemus Ward described life as he found it ; but there was a definite literary relation between life as he saw it around him and what he wrote which everybody recognized in his books. Mr. Clemens's humor, on the other hand, is American enough ; but his inventions, which he uses as a vehicle for it, are of no nationality. There is a kind of monstrosity about them which we remember in no other writer—a wild extravagance which is not simply that of exaggeration. No one but an American humorist would have thought of this termination of "The Recent Carnival of Crime in Connecticut":

"In conclusion, I wish to state, by way of advertisement, that medical colleges desiring assorted tramps for scientific purposes, either by the gross, by cord measurement, or per ton, will do well to examine the lot in my cellar before purchasing elsewhere, as these were all selected and prepared by myself, and can be had at a low rate, because I wish to clear out my stock and get ready for the spring trade" ;

but there is a wildness about it entirely individual. His "Legend of Sagenfeld," again, is a pleasant bit of humor, no more American than it is German, which might have been written by Hans Andersen, except that Andersen would perhaps not have made the sweepingly libellous statement with which, after explaining how the ass came to be the sacred animal of the kingdom, he adds : "Such is the legend. This explains why the mouldering image of the ass adorns all these old crumbling walls and arches; and it explains why, during many centuries, an ass was always the chief minister in that royal cabinet, just as is still the case in most cabinets to this day ; and it also explains why, in that little kingdom, during many centuries, all great poems, all great speeches, all great books, all public solemnities, and all royal proclamations always began with these stirring words : 'Wah . . . *he!*—wah . . . *he!*— wah-he !—wah-he—wah-he !'"

Essays from "The Critic." Boston : James R. Osgood & Co. 1882.

The essays and sketches of which this volume is made up have been reproduced in the form of a book, "in the conviction that some, if not all, of them are, despite their brevity, of permanent literary value," and because some of the earlier numbers of the *Critic* are already out of print. The authors' names are appended to the essays, and comprise John Burroughs, Edmund C. Stedman, Walt Whitman, R. H. Stoddard, F. B. Sanborn, E. W. Gosse, and others. Mr. P. M. Potter's account of Alphonse Daudet will be found of some biographical interest ; Mr. Sanborn gives some specimens of Thoreau's unpublished poetry, and J. H. Morse writes on "The Boston Culture." John Burroughs has an essay on "Emerson and the Superlative," in which he insists that, while Emerson was opposed to the superlative in theory, he was himself a "master exaggerator, a lord of extremes, holding the zenith and nadir in his two hands." As if to bring home to the reader what he means by the real Emersonian exaggeration, he adds the following curious qualification of his first statement :

"But, at his best, his superlative runs the other way—runs to excess of truth rather than to excess of form. Without adjective or adverb, he reaches the superlative degree by the sheer projectile force of his verbs and nouns. It is the exaggeration of quality, not of quantity ; of essence, not of bulk. His sentences are a steam-chest : the force of expansion is there without the expansion ; the gas is held by an iron grip, and made to work. He praises a low style, moderate statement ; but there must be a good many pounds' pressure to the square inch in the low style that suits him. The rivet-heads must be ready to fly, only they must not fly on any account. Perfect control and moderation, though you are handling thunderbolts."

The Island of Nantucket: What it Was and What it Is. With maps of the Town and Island. Compiled by Edward K. Godfrey. Boston : Lee & Shepard. 1882.

This is a curious combination of town history, guide book, and advertising medium. The material is well selected for the demands of summer visitors, and is accurate so far as we can judge ; but the alphabetical arrangement (bringing in, for example, "Historical Sketches" between "Halls" and "Hotels") is not at all satisfactory. Who would think of the heading "Distinguished Nantucketers" for Lucretia Mott, Maria Mitchell, and Secretary Folger? Most inconsistently, the section "How to Get There," comes at the very beginning, before "Agents," instead of between "Hotels" and "Jail," as, according to the plan, it should. Apart from the absurd arrangement and the advertising part, which is of course of merely ephemeral value, the book is useful and entertaining. The intricate landed system described by us some years ago (see *Nation*, Jan. 10, 1878) will be found set forth here under the head "Commons." The author makes no mention, however, either here or under the head "Agriculture," of the practice, in the last century, of deciding every year, by a vote of the proprietors, which of the sections of land should be cultivated, and with what crop.

Demosthenes. By S. H. Butcher, M.A., Fellow and Prælector of University College, Oxford, etc. [Classical Writers. Edited by John Richard Green.] D. Appleton & Co. 1882.

Mr. Butcher has given, in 172 pages, an admirable sketch of the life and times of Demosthenes, with a classified list of his speeches. There is no author read in a college course who needs a commentary like this more than Demosthenes does ; and we should suppose that this volume would come largely into use as a text-book in connection with the works of Demosthenes. The introductory chapter, on "The Age of Demosthenes," contains in a condensed form a useful statement of the condition of things both in Athens and in Greece, as a whole, at the time that the orator appeared : for example, the financial and military organization of the city is clearly described. The volume ends with a few forcible sentences in justification of the policy of the great orator. In view of the decline and death of the Hellenic spirit in the next generation, Mr. Butcher says : "We may still feel grateful to one who, though it was in a losing cause, strove to arrest so sad a decadence."

A Manual of Sculpture. Egyptian, Assyrian, Greek, Roman. By George Redford, F.R.C.S. New York : Scribner & Welford. 1882.

This is another of those "Illustrated Art Hand-Books" which are so rapidly multiplying to meet the growing demand for superficial information. The subject is here treated under four heads. The first relates to technics, and describes the various materials and processes employed in sculpture. The second part treats of

the æsthetics of the subject, and is not very profitable reading. It contains a good deal of confused talk about the supposed superhuman character of the Greek ideal, and counts among the causes of decline in Greek sculpture the practice of portraiture. Then follows a general outline of the history of ancient sculpture; and finally an explanatory list, arranged alphabetically, is given of the most important existing examples. This last is perhaps the most useful part of the book for those who require such information.

Ghiberti and Donatello, with other Early Italian Sculptors. By Leader Scott. New York: Scribner & Welford. 1882.

In this little book of 100 pages the story of early Italian sculptors from Niccolo Pisano to Michelozzo Michelozzi is told in brief outline. The author makes frequent reference to the works of the standard Italian authorities, and to Crowe and Cavalcasselle and to Perkins. The book may be of use as an introduction to more thorough study, especially to travellers in Tuscany, to whom it will afford rather more full, and perhaps more accurate, information than is to be obtained from the ordinary guide-books.

The Epoch of Reform, 1830–1850. [Epochs of Modern History.] By Justin McCarthy, M.P. Charles Scribner's Sons.

No better person could have been selected for the last chapters in English history than the author of 'A History of Our Own Time'; and his book, within the limits he has set himself, is acceptable and highly satisfactory. These limits are very narrow—twenty years of English history, and of only one phase of English history at that. We might add that considerably more than half the volume is given to the seven years of the reign of William IV. For the "reform movement" of William's reign, with its sequel in the first few years of Victoria's reign, this is a graphic and interesting sketch; but of the important foreign relations of England during this period we find hardly a word, and—for all his explanation—we cannot but think that the "Reform Epoch" ought at least to begin with the administration of Mr. Canning in 1827, even if we admit that it ended with the opening of the great series of European events that followed upon the usurpation of Louis Napoleon. It might be urged that the book is already large enough and none too detailed, so that a complete history of England during this period, or even a complete history of Reform from the repeal of the Test and Corporation Acts to the Disestablishment of the Irish Church, would have been impracticable in a volume of this size. But everything depends upon proportion; and if Mr. Seebohm related the history of the Reformation in one of these volumes, and Mr. Gardiner that of the Thirty Years' War, surely these peaceful events might be compressed in the same degree.

Good as this book is, therefore, it does not meet the real need that the "Epochs" series ought to satisfy for the nineteenth century. These reforms are probably already the best-known events of the period since the fall of Napoleon; but the great series of events of which, as Mr. McCarthy shows in his first chapter, these formed a part, are very imperfectly known, and very hard to get at. A volume which should begin with the Holy Alliance and the Congress of Vienna, and trace that reaction in every country of Europe of which Mr. Canning's administration was one of the first signs, describing the group of revolutionary events which marked the year 1830, and again that which marked the year 1848, and so on, down to the final triumph of constitutional principles in Austria and other countries of the Continent—such a volume is much needed, and would form an appropriate conclusion to the "Epochs" series. The English Reform movement is only one chapter—perhaps the most important, certainly the one which comes nearest to us—in this greater march of progress. We must add that the volume before us, as is natural, contains no map, being, we believe, the only one of this series which does not; but a more serious want is that of an index. There is neither index nor table of contents; but, instead, a Chronological Table of Contents, which is simply a chronology of the events here described, with references to pages of the book. It is elaborately and well done, but, after all, does not fill the place of an index.

BOOKS OF THE WEEK.

The Nation.

NEW YORK, THURSDAY, AUGUST 17, 1882.

The Week.

THERE is no very good reason to suppose that Mr. S. W. Dorsey ever sent to President Garfield the remarkable letter which was published on Sunday, or that it was ever written during President Garfield's lifetime. There are some reasons for entertaining a contrary opinion. The letter is dated February 7, 1881. At that time Mr. Dorsey was accredited with an earnest desire to secure the appointment of Mr. "Clint" Wheeler as First Assistant Postmaster-General, and the famous Dorsey dinner, which was given on the 11th of February, four days later than the date of the alleged letter, was really a demonstration intended to help on that project. What Mr. Dorsey's reasons were for desiring to have a friend in that particular office are now tolerably well known. Moreover, as Dorsey knew all the facts (which have been slowly dragged into the light) of the Star-route robberies and his own connection therewith, he had particular reasons for wishing to be on friendly terms with the new President. But the letter now printed is impudent and insulting, and calculated to excite the ire of any self-respecting man holding the high responsibilities of the Presidential office. It tells him that he owes his election to "Conkling and Arthur." These, says Dorsey, are "the two men who elected you, with the aid of Grant." Not to follow their advice, he adds, is to "drive the last nail in your political coffin." Even coarser language is used. The rumors about MacVeagh and James going into the Cabinet are dismissed as "blathering talk" and "detestable rot." Is it probable that a man who had an important end to gain, and who was actually about to start for Mentor to carry his point—the newspapers of the day mention the fact that he did go there directly after the dinner—would have written a letter which would in all probability have closed the door against him? President Garfield was a high-spirited man, who could have had no illusions as to Dorsey. They had served in Congress together, and had lived not far from each other before Dorsey "carpet-bagged" from Ohio to Arkansas. To suppose that Dorsey would, under such circumstances, take on the airs of a baggage-smasher toward the newly-elected President, from whom he had favors to ask and punishment to fear, requires better evidence than the publication of a letter nearly a year after President Garfield's death.

Whether such a letter was really sent at the time it purports to have been written or not, its publication is plainly an appeal to the Stalwarts, including President Arthur, to save an old friend of the name of Dorsey, who fought valiantly and bled other people freely in a memorable crisis of the past. There appears to be nothing stirring the public mind just now upon which the alleged letter has any bearing or significance, except the trial of Dorsey himself and his "pards" in the Star-route business. The Washington newspaper which publishes this precious missive, and vouches for its genuineness, hints that it has more of the same sort, or perhaps of a worse sort, which may be forthcoming hereafter. Will not President Arthur take the hint?

The way in which the appointment of new clerks has been going in the departments at Washington reminds one of the most "halcyon and vociferous" days of the spoils system. It is reported from Washington that Senator Don Cameron "gets" eighteen clerks, Senator Logan seven, Representative White, from Kentucky, as many as twenty-one, and that the Stalwarts among the Senators and Representatives generally "get" a large majority of the whole lot. Of course there has been no examination of the new clerks by the Government at all. They have been taken simply upon the recommendation of their political backers, and there is, therefore, a good deal of appropriateness in using the expression that Senator Don Cameron "got" eighteen new clerks in the Pension Office. It must be assumed that Mr. Cameron has satisfied himself of the qualifications of "his" Government clerks. It is not probable that he put them through a competitive examination as to spelling, syntax, arithmetic, letter and abstract-writing and the like; but, as he is at present engaged in a rather doubtful political fight in Pennsylvania, he has undoubtedly selected "his" eighteen clerks very carefully, with a view to the good the favor bestowed upon them and their families within the circle of their influence will do him in this contest. We have no doubt he has been quite conscientious in that respect, and the Commissioner of Pensions may then see how he can get along with the eighteen new men. He may be sure that if one or more of them turn out badly, Senator Cameron will be promptly on hand to protect them against removal, on the conclusive ground that it would hurt him in his State; and so all round. To illustrate this method of appointment, suppose one of our great New York banks had a number of new officers and clerks to appoint, and it became known that Mr. "Clint" Wheeler "got" the chief bookkeeper, Mr. ex-Insurance Superintendent Smyth "got" the cashier, Mr. "Johnny" O'Brien "got" the paying teller, Mr. "Jake" Patterson "got" the receiving teller, and Mr. "Barney" Biglin "got" half a dozen clerks. How many business men would feel perfectly comfortable in doing business with that bank?

The refusal of Secretaries Lincoln and Teller to appoint women to any of the clerkships recently provided for by Congress has caused a good deal of excitement among the female applicants for places, and we hear of indignation meetings, resolutions, and the like. The Secretaries are reported to have answered that for the places just filled, or to be filled, women were generally not well fitted. The larger question whether appointments of any class are henceforth to be given to women in those two departments seems to have been left open. It is probable that if the opinions of all the department, bureau, and division chiefs were polled, they would be found to be very far from being unanimous. Some of these functionaries would insist that, on the whole, men are more reliable and steady workers than women; that the women are kept away from their desks by indisposition much more frequently, and, therefore, give a lower average of time to the Government; that they are usually fitted only for certain kinds of duties and will fail in the discharge of others; that it is more difficult to keep them in good discipline; that they are more frequently, more persistently, and more unreasonably asking for favors and indulgences; that many of them are apt incessantly to trouble their superior officers by bringing down upon them men of influence, such as Congressmen and prominent politicians, to urge their applications for favors or to protect them against the consequences of their neglect of duty or other shortcomings; and, finally, that the presence of so many women in the departments has given occasion to much intrigue and scandal. A searching and impartial investigation of the matter would probably show that there is some truth in all these objections, but it would show also that there is much to be said on the other side.

The original reason for the employment of women in the Government service no longer exists: there are no wives or daughters to be provided for on the ground that their husbands or fathers are in the war, and the number of real soldiers' widows and orphans who are fit for office-work and who are not otherwise provided for, is small. But taking a larger view of the matter, it is certain that we should open to women all fields of useful activity which they can efficiently and properly fill; and it will not be denied that there are many things in the Government departments which women can do as well as men, and some which they can do even better. It would be difficult to find better copyists than they are, and, unless we are misinformed, it is believed in the Treasury that as counters and assorters of paper currency they cannot be excelled. In the discharge of those higher duties which require a certain degree of legal knowledge or mathematical faculty, or the exercise of accurate judgment and reasoning power, men are found in the departments to show on an average more fitness than women. But some women—although their number is not large—have proved very efficient as accountants, examiners of claims, keepers of books and records, and so on; and if a proper system of examination and probation be introduced which gives women an equal chance with men, it will not be difficult to pick out those of superior merit, and to assign them to corresponding duties. It is certainly true that there have been some

scandals which would not have happened had no women been employed in the public offices; but it is also true that the number of these scandals has been comparatively small, and that they might altogether have been avoided had a proper method of appointment been followed. Appointment by favor, and particularly by favor to those who recommended women for places, has been the source of the evil.

Dr. James McCosh, President of Princeton College, has written a short but forcible letter to the *Times* on civil-service reform. He discusses the movement, not merely from a theoretical, but also from a practical point of view. He lived in Great Britain when the reform "was discussed and carried there." He was a member of a commission "appointed by the crown to organize the system" on its first application to the Indian administration. Before he quit Great Britain he "saw the good effects that followed immediately and visibly" upon the adoption of the measure. The question, therefore, does not present itself to him as a speculative one. He looks at it as an experiment already made with great success on the other side, and likely to prove as successful here. Dr. McCosh urges the continued agitation of the subject by thinking and educated men. While he does not favor the discussion of such questions in the pulpit, he believes that ministers as citizens may profitably consider it, and that "colleges should speak out loudly and openly both by their officers and students."

The testimony hitherto taken by the Tariff Commission is that of interested witnesses, but it will go far to inform the Commissioners of the abuses and absurdities of the existing system, if they wish to inform themselves. The frequent contradiction of one witness by another helps to establish the truth. For example, last Thursday a representative of the manufacturers of saddlery hardware said that the investment of millions of dollars in the business had been made under the present tariff; that if it were reduced by even 5 per cent. the country would be flooded with foreign hardware, and that the duty of 35 per cent. was not equal to the difference between the cost of labor here and its cost abroad. If we accept this statement of the case as true, we must believe that, in consequence of the higher rate of wages, it costs at least 35 per cent. more to make the hardware in this country than in Europe; that the tariff, by raising the price of the articles 35 per cent., enables the home manufacturer to compete with the foreign, and that even a slight reduction would make such competition impossible. But another representative of the same interest told a different story. He said that the tariff had not increased the price of the goods. Clearly, then, the tariff is of no use as a protective measure. This witness said the effect of the tariff had been actually to lower the price. Why not repeal it then and send the price up? The witness further made short work of the wages argument. He said that saddlery hardware was never so cheap before, not because of foreign competition aided by pauper labor, but on account of "home competition and improved machinery." This is a demonstration of the failure of the protective tariff to protect. The manufacturer must in some way find "protection" against his American competitor. With all his concern for his highly-paid workmen, he does not hesitate to cut down the aggregate of their wages by using improved machinery to take the place of labor—as, indeed, there is no reason why he should hesitate. Another advantage of the English manufacturer mentioned by this witness is that he can get copper cheaper; and the well-known fact was referred to that American copper is sold to English manufacturers for five cents a pound less than the price in this country. It is understood that a condition attached to the sale is that the copper shall return to this country only in a manufactured form. This is the way in which the American copper producer protects himself, and illustrates the folly of the high-tariff system.

The Navy Department vindicated its dignity and traditional reputation recently by relieving Capt. J. K. Miller of the command of the frigate *Tennessee*. His offence was a curious one, and consisted in the employment of one Henry Burnett, a Sandy Hook pilot, to bring the ship into New York harbor. Such employment is inconsistent with a rule which requires every commander in the service to be his own pilot, at least upon entering home ports. This rule originated in the times when we really had a navy and when it was proud of its seamanship. The suggestion that any naval officer could be taught anything by a sailor in the merchant service would then have been repelled with scorn. For a captain of a vessel-of-war in those days to ask a pilot to show him the way from the lightship to the Brooklyn Navy-yard would have been as undignified a proceeding as to ask the crew of a trading bark to reef his topsails or to execute any other nautical manœuvre. Times, however, have changed, and Captain Miller believed it to be not unbecoming to seek assistance in avoiding the dangerous shoals and deceptive currents of the bay. Mr. Burnett agrees with the captain that it would not have been safe for him to do anything else; and their views are confirmed by the fact that the *Tennessee* afterward, in trying to go into Boston harbor without a pilot, ran aground.

Senator Sherman has delivered a speech at Mansfield, Ohio, in which he defended the large river and harbor appropriations, as he probably would not have done had he still been Secretary of the Treasury, and in which he is reported to have said that the Sunday and the liquor questions are "an irrepressible conflict which must be met." We do not know whether Mr. Sherman is correctly reported, but, if he is, he will upon reflection satisfy himself that these questions do not represent any "irrepressible conflict" at all; that they cannot be "met" and finally settled by legislative enactments, whatever attempts in that direction may be made; that they are really under the control of a public sentiment which gradually modifies the ways of thinking and habits of society in a manner which will make a law designed to overrule it a dead letter; that this public sentiment has its fits and starts, but finally always develops itself in the way of tolerance; and that these questions are most apt to push themselves forward on the political stage and to agitate the nerves of the politicians at times when there are no other issues strongly engaging the popular mind. The "irrepressible conflict" in Ohio will subside again in due season.

The agreement between the United States and the Republic of Mexico, by which the troops of the two parties are reciprocally authorized to cross the boundary line of the two countries in close pursuit of hostile Indians whenever it may be necessary, is undoubtedly calculated to satisfy a long-felt want on that frontier. The territory of Mexico has always served as a refuge for Indian desperadoes escaped from the United States, who used their asylum as a basis of operations for hostile incursions. This circumstance has, in a great measure, made Indian "wars" in that region so frequent and interminable. Our troops have sometimes crossed the Mexican line without authority, but this always led to remonstrances on the part of the Mexican Government. The present agreement will, in a great measure, do away with these embarrassments, although we are not sure that, in spite of the careful regulations it contains, it will not in the course of time prove a prolific source of "claims."

The drainage of summer "resorts" is so frequently bad that the public at large have a good deal of interest in the typhoid cases which have caused so much trouble at the Bellevue Hotel, at Seabright. The admitted facts are that two of the guests, one of them a woman, were suddenly taken ill with typhoid fever, which, according to their side of the case, came from improper drainage. Whatever it came from, it caused a panic in the hotel, and great loss of business. The hotel proprietor, Mr. Corey, who has a lease of the premises, recouped himself to the extent of $5,000 by informing the friends of the patients that unless that amount of money was immediately paid they would be turned out of the hotel. As the exposure was almost certain to be fatal to them, the money was paid, and they were allowed to remain. The friends of the patients now threaten to "make it hot" for Mr. Corey, and we trust they will succeed in doing so, if, as they maintain, he is responsible for the fever. There is no principle of law or justice which allows a hotel-keeper to extort money in this way for a fever contracted in consequence of the bad drainage of his premises, and generally it does come from bad drainage. People do not contract typhoid fever wilfully, and as they usually know little or nothing of the drainage of the places they go to in summer, they are very much at the landlord's mercy. If he can, the moment a disease of this kind breaks out, threaten those attacked with death by exposure, a new terror is added to summer seaside life.

The "Ford boys," who killed Jesse James, have, it seems, been suffering in public

estimation through the misrepresentations of the press. A story had got about that they had been "rioting" in Richmond, Missouri, which they deny emphatically, and say that they have not been in Richmond lately. They say that the fact is, a couple of low fellows, knowing their fame and position in society, "went through" the town, "claiming to be the Ford boys." The real boys have therefore given notice of the fraud through the press, and desire that the two ruffians may be treated as they deserve. The boys have, it is said, like so many other distinguished characters, taken to the stage, and we regret to learn that they have lowered themselves somewhat by appearing in some sort of show in "a State Street dive." They say, however, that they had no idea of the character of the place, and had to "fill their contracts." As to future plans, they propose to "star," and hope to obtain engagements in first-class theatres. This frank statement of their intentions ought to remove the misunderstanding created by the behavior of their fraudulent rivals.

It has been a dull and uneventful week in Wall Street. The New York banks added $1,147,875 to their surplus reserve, and the rates for demand loans ruled at 3@4 per cent. Foreign exchange was firm, but below the gold-exporting point. The merchandise exports are increasing, but to a large extent the bills against them were engaged by bankers in July. The movement of securities between New York and the foreign markets has been against New York to a moderate extent. The prices of railroad stocks were variable during the week, but in most instances higher figures were established. The general outlook for trade is encouraging, as the large crops are a solid basis for a full year of prosperity, seeing that the foreign demand for our food products promises to be larger than of late.

In an English libel suit brought by a sculptor named Belt against *Vanity Fair*, the Judge, Baron Huddleston, was reported to have said he would allow the plaintiff to make a bust of himself in the presence of the jury, in order to show what sort of a sculptor he was. This seems to have been taken as an intimation that the Judge was willing to allow ocular demonstration of all sorts, and, accordingly, a plaintiff in a recent suit for personal injuries against a railway company, in order to prove how lame he was, offered to walk across the court-room. Baron Huddleston however, refused to permit it, and said that he had been entirely misrepresented by the press, and had never said that Mr. Belt might make a bust of him. The general introduction of tests of this sort would be productive of great inconvenience. We should have plaintiffs in libel suits not only modelling, but painting, singing, declaiming, acting, in order to show how unfair any criticism of their performances was. Moreover, if some paper should say, for instance, of Mr. Booth that he ranted, or of Nicolini that he could sing no more than a cat, no fair test would be possible in court, and there would be nothing for it but to take the jury to the theatre or opera on several successive nights to let them see and hear for themselves. This would involve a great deal of time and expense, and the result would probably in most cases be a disagreement.

Mr. Freeman, the historian, has been recording in the *Fortnightly Review* his impressions of America, derived from the tour which he made here last year, and he declares that the thing which principally struck him was the great similarity between England and the United States. Where he expected differences he finds resemblances. England and America he discovered to be more alike than England and Scotland. The great American cities are very like Manchester and Liverpool. He thinks that the ideal after which the two branches of the race should strive, is for both to feel "at least as close a tie to one another as was felt of old by all members of the scattered Hellenic folk"; but for this purpose we ought all to have a common name. Mr. Freeman, who confesses himself somewhat of a pedant on this subject, will not hear of "Anglo-Saxon," because he does not think it historically or philologically correct. Nor will "Briton" do, because it "is not the natural name by which an Englishman speaks of himself; it is used either in a half-laughing vein or because it is thought to be fine, or else of set purpose to find some name which shall take in all the people of Great Britain. The only alternative would seem to be the grotesque and rather ugly form 'Britisher.' And I always told my American friends," he says, "that I had rather be called a Britisher than an Englishman, if by calling me an Englishman they meant to imply that they were not Englishmen themselves." It may be that if all the members of our great and wise race were suddenly to adopt the practice of calling themselves "Britishers," it would help on the cause of international amity, but there would of course be a difference between the use of such a term and that of "Hellene" among the Greeks, who did not agree to call themselves Hellenes for the purpose of establishing a good understanding among themselves. They called themselves so because they could not help it, and it must be confessed that their common historic name did not prevent the different branches of the race from waging the most bloody and destructive wars with one another.

It seems to be the tendency of English opinion at present to exaggerate the similarity between the two countries, just as a generation ago it was the custom to exaggerate the differences. Of course, within that period there have been enormous changes in the United States, while all parts of the world have grown more alike, owing to the increase of the facilities of communication. Still, comparing the tour and observations of Mr. Freeman and other recent visitors with those of Dickens and his contemporaries, it is impossible to attribute the changed tone altogether to a changed condition of society at home and abroad. A generation ago when an Englishman inspected us, he did it with the expectation of finding a new and totally distinct species from himself, and he invariably found one. Now, he comes with the expectation of finding similarity, and he finds that. Formerly he was almost surprised to hear his own language spoken, and now he wants to have the whole race adopt a common name. This obviously may be pushed too far. As a nation, we have grown too prosperous and strong to care any longer very acutely about hostile foreign criticism; but it ought to be understood that there is one thing that we do insist upon, and that is, having peculiarities of our own. It is certainly possible to meet with Americans who are unduly vain of their country, but the class of Americans who like to be mistaken for "Britishers" is a small one, and is eyed with some jealousy and distrust by their fellow-citizens.

The ground is now fully cleared for the impending trial of arms in Egypt. The Porte, in its fashion, has proclaimed Arabi a rebel; Russia has professed satisfaction with England's explanation of the occupancy of Suez; England and France have agreed, with reserves, to Italy's proposal, in the Conference, of a European police of the Canal; and Sir Garnet Wolseley has arrived at Alexandria, and for the moment finds himself unembarrassed by the presence of Turkish troops. A few days will show what part Ismaïlia may serve as one of the bases of his campaign. On the other side, if we may trust reports, Arabi is retorting on the Sultan by deposing him and doing his best to propagate a religious war. The only significant political utterance of the week has been Mr. Gladstone's speech at the Lord Mayor's banquet, with reference to England's disinterested undertaking to protect the interests of the civilized world in the Suez Canal.

The "Mussulman jurists" whom the cable despatches report to have given a legal opinion on the status of Arabi before the law, must not be imagined to be what we call "jurists" in this country. Law in Turkey, especially public law, is not discriminated from religion, and both are ascertained by a construction of the texts of the Koran. Oriental jurists, not being familiar with the principle of *stare decisis*, decide each case as it arises without reference to whether it is in conflict or accordance with previous decisions, and consequently no two decisions are necessarily alike. They have in giving their replies only one fundamental guide, and that is to satisfy the Sultan. Knowing this, the Sultan wisely frames his questions in such a way that the jurists may know what the answer ought to be. In the present case the cable despatch only gives the answer, but we can give the question. It was as follows: "O jurists, is Arabi Pasha, in so far as he has disobeyed the Caliph, a rebel, and may he be unceremoniously treated as such; but in so far as he has been a defender of a Mohammedan country against the aggressive designs of Christians, has he merely fulfilled the duties of a good Mussulman? May the Sultan punish Arabi Pasha, if some act of rebellion is proved against him, while dissociating himself from those who wish to crush Arabi Pasha as the defender of Islam?" A jurist who could not tell how to answer this would be immediately dismissed from the force.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, August 9, to TUESDAY, August 15, 1882, inclusive.]

DOMESTIC.

WASHINGTON was immediately deserted, after the adjournment of Congress, by the politicians and office-holders. In several of the Government departments, however, there is considerable activity. In the State Department the laws recently passed are being deposited and recorded. The Treasury is occupied with the transfer of bonds. The office of the Supervising Architect is busily engaged in preparing plans for the new public buildings ordered by Congress. The Navy Department is interested in beginning a new fleet of vessels. In the War and Interior Departments pension claims are occupying a number of new clerks. A list of 422 appointments to clerkships in the Pension Office was announced on Thursday, the first of the 800 provided for in the Legislative Bill. The appointments were all made by political recommendation, and not by a civil-service examination. Stalwart Senators got a large share. Of the entire list only about a half-dozen are women. The reason announced is that the duties of the positions are not suited to their sex. The disappointed women held an indignation meeting in Washington on Thursday night.

During the last hours of Congress, Senator Windom presented a report on the whiskey investigation. The report asserts that no corrupt action had been proved in regard to the passage of the Bonded Spirits Bill. It finds that an association of distillers in Kentucky raised $5,000 to pay a lawyer for pushing the measure, but that nothing was done by him inconsistent with the character of an honorable attorney. The imputations cast on honorable journalists were not supported by evidence.

President Arthur left Washington on Thursday afternoon, on the steamer *Despatch*, for New York. He will remain in this city for about ten days, and then make a short visit to Newport.

The Secretary of the Navy has approved a flag of navy-blue bunting, with the American coat of arms in the centre, as the President's flag. It will fly from the mainmast of every vessel when the President is on board.

The closing arguments in the Star-route trial have been in progress in Washington in the Criminal Court during the week. On Wednesday morning it was announced that the following order of speaking had been agreed upon by counsel: Mr. Ker to open for the Government, to be followed by two replies from the defence. Colonel Bliss will then deliver his address, to which the defence will be allowed three replies. The Attorney-General or Mr. Merrick will next speak, followed by three replies from the other side, and then the Attorney-General or Mr. Merrick will close the argument. Mr. Ker then began his argument. It was an analysis and restatement of the evidence in regard to each of the routes, with a running commentary of sarcasm and invective. Mr. Ker closed his speech on Friday.

Mr. Carpenter, counsel for the Dorseys, opened the argument for the defence in the Star-route trial on Monday. He reviewed Mr. Ker's argument, and attempted to show the necessity for "expedition." His speech was continued on Tuesday.

A letter was published in a Washington Sunday newspaper, on August 13, from ex-Senator S. W. Dorsey to President Garfield, dated February 7, 1881. The editor of the newspaper professed to have found the animus of the Star-route prosecution in the letter. It is, in short, an impudent letter of instructions to the President, who was soon to be inaugurated, not to take advice in regard to his Cabinet appointments in New York from Col. George Bliss or Mr. Knox, or other men of that liberal class, but to send for "Conkling or Arthur, the two men who elected you, with the aid of Grant." Mr. Dorsey also remarks, "I am tired of this blathering talk about McVeagh to go into the Cabinet from Pennsylvania, and James from New York. Such detestable rot should be smoked out at once, and you ought to do it in some public way. As I have repeatedly urged upon you, there is but one appointment you ought to make from New York, and that is Chief Judge Folger to be Secretary of the Treasury." General Garfield was further kindly informed that "all that Mr. Conkling wants, and all that General Arthur desires, is a fair show and an honest deal. These two men, with their friends, represent the intelligence, the progressive and the aggressive elements of New York Republicanism."

The fall campaign was opened at Mansfield, Ohio, on Saturday night, by Senator Sherman. He defended large appropriations for rivers and harbors and public buildings. On State questions he declared the Sunday and liquor questions to be an irrepressible conflict, which must be met. He was in favor of the observance of the Sabbath.

The Republicans of Indiana, in Convention, on Wednesday, nominated Emanuel R. Hawn for Secretary of State, Roswell S. Hill for Treasurer, and other minor officers. The platform demands that the pending prohibition amendments to the Constitution of the State shall be submitted to the people, the fountain of power, by the next Legislature, for decision thereon; that there be such a reduction in taxation that no unnecessary burdens may be inflicted upon the consumers of imported articles, nor upon our domestic industries; and that Congress adopt laws to secure a thorough reform of the civil service. The National and State Administrations are warmly approved.

The Kansas Republican State Convention on Thursday renominated Governor St. John by a very large majority. The platform declares unqualifiedly in favor of prohibition; demands the enactment of laws regulating railroads; and requests the next Legislature to submit a woman-suffrage amendment to the Constitution.

The Illinois Prohibition Convention met at Bloomington on Wednesday. It adopted a strict prohibition platform, and nominated Judge J. G. Irwin, of Madison, for State Treasurer, and Professor Andrews, of Galesburg, for Superintendent of Public Instruction.

Senator John Stewart, the Independent Republican candidate for Governor in Pennsylvania, has forwarded a letter to General Beaver, the Stalwart nominee, proposing a joint discussion of political differences in the State.

The Republican Executive Committee of South Carolina have decided to hold a State Convention on September 12, but to endorse the nominations of the Greenbackers.

At Saratoga, the American Bar Association was in session for several days during the week. Mr. Francis Kernan delivered the annual address, giving a review of recent legislation in various States. Many valuable legal papers were read during the session. After a long discussion, a resolution was adopted approving a bill for the relief of the Supreme Court of the United States, which was advocated by ex-Secretary Evarts.

The Photographers' Association of America held its annual Convention in Indianapolis last week. More than 500 delegates were present.

At Long Branch the Tariff Commission heard the pleas of representatives of a number of industries during the week. On Friday they paid a visit to the Trenton potteries.

In secret session at Chicago, the Amalgamated Iron and Steel Association adopted a new constitution, and laid the basis of a better understanding with the manufacturers. It is said they guaranteed the manufacturers not to ask an advance on the rolling and puddling scale prices for five years.

In the Pittsburgh, Pa., iron region, more mills are resuming work, with non-union men as operatives. The Philadelphia grain-handlers' strike was ended by the men returning to work at the old rates.

Heavy rains have fallen throughout the West and Northwest within the past week, and in some sections great damage has been done by them to the crops. In many places in northern Ohio the hay crop will be a total loss. Wheat in stacks and shocks is beginning to sprout. The oat crop is also injured. In the Northwest the damage done was trifling, and the wheat crop just harvested is said to be the finest ever raised there. There was frost in Wisconsin on Thursday morning, and a snow-squall on Lake Michigan.

An agreement has been entered into by this country and Mexico, providing for the reciprocal crossing of the international boundary-line by troops of either country in pursuit of hostile Indians.

Gen. J. Rufino Barrios, President of Guatemala, sailed for Liverpool from this city on Saturday. It is said that before sailing a convention was signed which will end the dispute about the Guatemala-Mexico frontier. The convention, it is reported, contains the following provisions: The high contracting Powers agree to submit their differences to arbitration by the President of the United States. Guatemala abandons her claims to Soconusco, and recognizes it as now belonging to Mexico. A boundary commission is to be appointed by both of the contracting Powers to run a dividing line between them.

The British Government has been searching the foreign mails for seditious matter. Clippings from an American newspaper which were transmitted in a registered letter have been intercepted. The Post-office Department of the United States acknowledges the permissibility of the proceedings under the international postal treaty.

There have been sixty-two cases and twelve deaths from yellow fever at Brownsville, Texas. It has also appeared at New Orleans. It is epidemic at Matamoras, Mexico.

A virulent disease has appeared among cattle in Pennsylvania, West Virginia, Alabama, and North Carolina.

Judge Donohue, in the Supreme Court Chambers in this city, rendered a decision on Thursday, in a suit brought against Dr. Stephen H. Tyng, jr., by Edward L. Owen, his partner in stock speculations. The latter claimed more than $5,000 as the balance due him after all credits were allowed. The Judge decided that he thought the plaintiff honestly intended to give a bill of particulars, but it was too general, and should be made more definite before payment could be enforced.

A brakeman on the Elevated Railroad, in this city, on Friday, was thrown from his platform to the street below in a scuffle which he had with a bar-tender, named Reddington, who tried to board the train at Bleecker Street after the gates were closed. He was fatally injured. A woman was run over on the same day at the Fiftieth Street station, on the Sixth Avenue road. She died at midnight.

Commodore Shufeldt, who negotiated the Corean treaty, is ill at the Naval Hospital in Mare Island, Cal. He has just returned from China.

Gen. G. K. Warren was buried on Saturday from All Saints' Chapel, Newport.

Ex-United States Senator George R. Dennis, of Maryland, died on Sunday. He served in the Senate from 1873 to 1879.

Mr. Jesse Hoyt, for many years one of the most prominent business men of this city, died on Monday morning, at the age of sixty-seven. He was engaged in the grain commission business until 1881. He had large railway interests in the West.

FOREIGN.

At the seat of the war in Egypt the week has been marked by preparation, and by a few skirmishes. The armored train, on its usual night patrol on Wednesday evening,

exchanged a few shots with Arabi's second line of intrenchments near Mahalla Junction. It is asserted that the rebels are fortifying Nefersa Junction, where the Suez, Ismailia, and Cairo lines of railroad meet. The enemy have evacuated the works immediately opposite the Ramleh position, and there will be no attack at present; but Arabi is having constructed, within three miles of Ramleh, a formidable redan and embankment, thirty feet high. The British ship *Superb* fired shell at the works on Friday. On that day Captain Ewart made a plucky reconnoissance from Fort Meks. He started at 1 o'clock in the morning with an interpreter, and by daybreak had ridden ten miles into the country. He ascertained that there was no truth in the report of large bodies of the enemy in the direction in which he rode.

A council of leading British military authorities has been investigating the effects of the bombardment of the forts at Alexandria, and the general tenor of the evidence is that masonry is useless against modern guns, but that earthworks turn every shot.

A skirmish took place on Sunday to the westward of Alexandria, beyond the Meks forts. The sailors and marines stationed there drove the Arabs back with the fire of a small field-piece. There was no loss on the British side.

Great activity has prevailed in England in the preparation of troops for Egypt. Daily several transports have started with regiments on board. In India there has been similar activity. On Wednesday, five transports with troops left for Egypt from Bombay. General Wolseley arrived at Alexandria on Tuesday, and took command of the Army.

The Berlin organ of Prince Bismarck, in an article friendly in tone toward England, denies the rumors of an intention of placing the Suez Canal permanently under the control of a mixed commission similar to that on the Danube. As the British traffic on the Canal immensely preponderates, the Powers, it remarks, cannot expect England to subordinate such vast interests to the decision of a non-English majority.

At a meeting of the Conference in Constantinople on Thursday, the Sultan submitted the following proclamation: "Arabi Pasha, having a second time transgressed the law by taking authority which does not belong to him, and having presumed to menace the vessels belonging to an old and tried friend and ally of Turkey, is, for these misdeeds, proclaimed a rebel, together with his adherents. Be it known to all that obedience is due solely to the Khedive, who is the representative of the Sultan." Lord Dufferin, the English representative, then announced the assent of England to the proposal of the Italian Ambassador for temporary international protection of the Suez Canal. It is understood that he did not insist that England should have supreme command of the troops in Egypt. England's assent to Italy's proposal is coupled with a reservation that if international police are sent to guard the Canal, they shall not interfere with military operations. The Russian representative asked why England had occupied Suez. Lord Dufferin replied that the step was taken on account of military necessity, and in order to save the town from pillage. Lord Dufferin insists that, in order to secure harmony of action, no movements of the Turkish troops, when they are in Egypt, shall take place without the preliminary consent of General Wolseley. The Sultan has ordered that an addition be made to the proclamation against Arabi, declaring him a rebel, because, in resisting, he acts contrary to the principles of the Koran. Importance is attached to this mention of the Mohammedan Bible. No Turkish troops will be landed in Egypt until the arrival of the Turkish Special Commissioners. France has accepted, under certain reservations, the proposal for collective protection of the Suez Canal.

It is reported that Arabi called a meeting of the Ulemas on Sunday, and obtained from them a decree deposing the Sultan and naming the Sherif of Mecca as Caliph. On Tuesday Arabi was ordered by the Sultan peremptorily to lay down his arms. If he refuses, the Sultan will leave him to be dealt with by the English.

At Constantinople, on Monday, the Conference finally agreed to the Italian proposal in regard to collective police supervision of the Suez Canal. The proclamation against Arabi will not be issued until the convention is signed.

At the Lord Mayor's banquet in London, on Wednesday evening, to the British Ministers, Mr. Gladstone, in response to a toast, said with reference to the Egyptian question: "It is of vital importance that the position of England should not be misunderstood. Forces have gone to Egypt in prosecution of great interests of the empire. Unless those interests exist it would not have been possible for us to find a justification for intervention. But let it be known and proclaimed from this spot that those interests are not ours alone, but interests we have in common with every state in Europe—nay, with the whole civilized world." In regard to the Suez Canal, he said that the utmost they had in view was to keep that gate open, and the country in which it is situated peaceable. This was a work which every country in Europe should perform. In conclusion, he said: "We do not go to war with the Egyptian people, but to rescue them from the oppression of military tyranny; nor do we make war upon the Mohammedan religion, as Englishmen respect the convictions of believers in every other faith. We do not want to repress the growth of liberty in Egypt, but desire that she be prosperous. England goes to Egypt with clean hands, and with no secret intention to conceal from other nations." In the House of Commons on Thursday, Mr. Gladstone said that an indefinite occupation of Egypt was not contemplated. The ultimate condition of Egypt could not be settled by any one Power.

A meeting of Conservative Peers was held at the residence of Lord Salisbury, in London, on Thursday. Lord Salisbury adhered to his original view in regard to pressing the Lords' amendments to the Arrears Bill, but he was overruled by a large majority of those present. The matter came up in the House of Lords later in the day. Lord Salisbury then declared that he thought the bill was a public blunder, but as he found himself in a hopeless minority he would not challenge a division. The Lords then acquiesced in the rejection of the first amendment by the House of Commons, and agreed to all the reamendments. It is said that Lord Salisbury thinks of declining the Tory leadership, in view of this rebuff. The Duke of Richmond took the lead in urging the concessions upon the Conservatives.

Mr. Gladstone has announced that Parliament will adjourn next Friday until the 24th or 26th of October.

The threatened strike of the Irish constabulary has been averted, or at least postponed, by the tact of the Government. On Wednesday the Limerick police, as a consequence of an interview between the County Inspector and the Clonmel deputation, in which the former acknowledged that their claims were justifiable, telegraphed all over Ireland that they were resolved to suspend the agitation for the present, pending the action of the Government. The Cork police took similar action, and repudiated the charge that they were in collusion with the Fenians. Earl Spencer addressed the constabulary in Dublin, and announced that $900,000 would be immediately distributed, and any grievance inquired into.

Thomas. Walsh, who was arrested at the time of the seizure of arms at Clerkenwell, Ireland, and convicted of treason-felony, has been sentenced to seven years' penal servitude.

Henry George, the American political economist, was arrested in Loughrea, Ireland, on Wednesday, under the Curfew section of the Crime Act, and kept in custody until he could give a satisfactory account of himself. He was rearrested on Thursday, at Athenry, and accused of associating with suspects, but was liberated on Friday. Stephen J. Meany, the correspondent of a New York newspaper, was arrested on Thursday night, in County Clare, Ireland, charged with being a dangerous character. He was subsequently released on giving bail for his good behavior for six months.

At a special meeting of the Ladies' Land League, in Dublin, on Thursday, the League was dissolved, and a recommendation was passed that leagues be established throughout the country to teach the rising generation the national history.

Theannual Convention of the Irish Land League of Great Britain was held in Manchester, England, on Saturday. Three hundred delegates were present. Resolutions were passed relative to the death of Miss Fanny Parnell. A report presented asserted that the Highlands of Scotland were ripe for land agitation. A resolution making peasant proprietary one of the objects of the League was adopted by a large majority. An amendment embodying Mr. Davitt's land-nationalization scheme was rejected. The justice of aiding the laborers was recommended to Irish farmers.

Westgate, the self-confessed assassin of Lord Frederick Cavendish and Mr. Burke, in Dublin, has arrived at the Island of Jamaica. A despatch from there says that the evidence implicating him in the crime is strong.

The Dublin Exhibition was opened, and the O'Connell statue was unveiled in that city, on Tuesday, with great ceremonies.

The North German Lloyd's steamer *Mosel*, from Bremen for New York, went aground off Lizard Point, England, at 8:30 o'clock on Wednesday morning. The accident happened during a dense fog. There were about 700 passengers on board, but there was no panic among them when the vessel struck. They were all safely landed at Penzance. The mails and specie were also landed, and part of the cargo was taken off. The *Mosel* has a big hole through her bow, and the bottom from stem to stern was broken. An effort is making to raise the vessel.

A meeting of English gentlemen interested in rowing was held in London on Friday evening, and resolutions were passed expressing sympathy with the Hillsdale, Mich., crew, and protesting against the action of the self-elected Rowing Association in excluding them from amateur races.

William Stanley Jevons, Professor of Political Economy in the University of London, was drowned while bathing at Bexhill, England, on Tuesday. He was forty-seven years of age. His best known work is 'The Principles of Science.'

The condition of Tripoli is alarming to Europeans. The natives talk of a massacre of Christians. A holy war is being preached throughout Morocco against Christians.

A great anti-Christian demonstration has occurred at the funeral, in Beirut, Syria, of a Moslem who, it was reported, was murdered by the Christians. Many fled to the mountains. A score were arrested, and one was killed.

A decree has been promulgated in France, giving duly authorized American joint-stock companies a legal status in that country.

A decree closing the session was read in both the French Chambers on Wednesday.

Professor Esmarch, the eminent German surgeon, has published an essay on the treatment of General Garfield's wound, in which he holds that the late President might have lived had it not been for the treatment he received.

The vessel conveying Lieutenant Bove and the members of the Italian Antarctic expedition has been wrecked off Cape Horn. All on board were saved.

THE STAR-ROUTE DEFENCE.

NOTHING in the Star-route trials has attracted more attention than the tone of defiance adopted both by the defendants and by their leading counsel from the beginning. Mr. Carpenter's address to the jury on Monday was one of the most impudent harangues ever delivered in a court of justice. He denounced the Attorney-General for appearing in the case, and denied that it was possible that the President should have instructed him to prosecute. The reason that he assigned for this assertion was that "Chester A. Arthur was a man," and therefore it was incredible that he should have decided to proceed against "his friend, his familiar, his acquaintance, one with whom he was on terms of kindness and hospitality, one with whom he had associated in political life for years, and one for whom, about a month before his accession to the Vice-Presidency, he had borne testimony as a capable and honest man." The Attorney-General had said that he was "the mouth of this Government to urge that this case be heard and determined." If he spoke for the President, this amounted, according to Mr. Carpenter, to saying that the President "was in a conspiracy, contrary to justice and humanity, to crush the defendants arrayed in this court." He was going on to prove still further how unlikely it was that the President should have taken any part in the conspiracy to ruin Brady and Dorsey, by a reference to the Delmonico dinner of last year, but was stopped by a reminder from the Court that there was no evidence relating to that dinner in the case. The whole drift of his speech was that some wicked and designing men had conspired to ruin his clients, and that they were hiding behind the President and the Attorney-General.

This is all of a piece with the conduct of the defence from the first. The principal reason why the defendants' guilt has generally been assumed is that their behavior has been that of guilty men. After first insisting on a trial for purposes of a vindication, they interposed every technical defence they could invent to prevent the case going to the jury. Finally, being obliged to go to trial on the facts, they opened fire on Court and witnesses through newspapers controlled and owned by one of the defendants, and when this defendant had an opportunity of going on the stand, and testifying in his own favor, he declined to do so and remained dumb, with testimony in the case nearly conclusive as to his guilt, if believed. Finally, while the case is being summed up, a letter purporting to be written by this defendant is published in his interest, the object of which is, if anything, to show that he is the victim of a conspiracy, but which in reality consists of nothing but foul-mouthed insolence and abuse, and reveals nothing except the low character of the person who says he wrote it.

It must be remembered that in discussing the "guilt" of the Star-route defendants, the jury which is trying the indictments for conspiracy is considering a different question from that in which the public at large are interested. There is nothing more technical than an indictment for conspiracy; no criminal offence is harder for the prosecution to make out satisfactorily, and none in which the defence has so many loopholes of escape. Nobody can possibly say in the present position of the case any more than the Court has itself said—that there is sufficient evidence of guilt to require that the jury shall pass upon it. But the question of "guilt," particularly in the case of Brady, in which the public are interested, is not simply the question of liability under this indictment for conspiracy. As alleged by Mr. Carpenter, it may be that if Walsh's testimony is true—that Brady told him he taxed all the contractors twenty per cent. on "expedition"—this would technically be extortion, and not conspiracy to extort; and a verdict of not guilty would leave it entirely uncertain whether Brady's escape was not owing to some such technical distinction as this. All that the public care about, however, is to know whether Brady defrauded the Government and betrayed his official trust.

Now, in arriving at a conclusion as to this matter, Brady's behavior and that of his counsel are important elements in the case. If they had from the first set about to produce a general certainty of their guilt, they could not have done the work better. The behavior of the ring has been very much like that of the Tweed ring here. When Tweed's frauds were detected, the material proof (consisting in the inflation of contracts) resembled a good deal the material proof in the Star-route cases, and the technical difficulties in the way of legal proof were quite as great; indeed, it seemed almost impossible for a long time to get any legal redress of any kind. But as some of the ring ran away and others confessed, and those who stayed brazened it out, much as Brady and Dorsey are brazening it out now, the only question of guilt in which the public had any interest was settled long before any of the rascals were brought to justice.

It must be considered fortunate for society on the whole that this is so. If the legal presumption of innocence that we always hear so much about from the defenders of men like these, meant that nobody must form any opinion about their characters and acts except under the technical rules of law applicable to an indictment, society would hardly be able to protect itself with much success against rascality. If on the acquittal of such a man as Brady, the public had immediately to treat him as an honest man, it is hard to see why he should not be restored to public favor, and again be put in possession of public funds. Dorsey, who is involved with Brady, actually does take very much this ground, and has refused to resign from the Republican committee, because, he says, until he has been tried by a jury, it is impossible to say whether he is a criminal or a good and pure man who is amply qualified for party leadership. This was the ground that Tweed took, and he actually got himself elected to office by a popular vote after his crimes had been fully exposed. But it is to be hoped that the notion that nothing short of a conviction for felony will disqualify a man for politics, or put him beyond the reach of "vindication," is sufficiently on the wane to make Dorsey's position untenable, and the repetition of such defences as that of Brady impossible.

THE SALVATION ARMY AND THE CHURCH.

THE rise and progress of the revival caused by "General" Booth by means of the Salvation Army in England, is attracting more and more attention from the regular churches. Unlike many revivals, the Army acts in a certain sense in hostility to the Church of England as at present organized. In the current number of the *Contemporary Review*, "General" Booth gives an account of his work, and the Rev. Randall T. Davidson criticises its operations with great acuteness. The "General" declares that for his purposes the ordinary systems of church government are of no use, and that an absolute military despotism is the only thing that will produce "unbroken peace and harmony." He has been engaged in his task for some seventeen years, and has experimented with other systems, but finds nothing but army discipline of any avail. His Army is really an autocracy, which recalls that of the Jesuits, and is in many respects similar to the Mormon system. The "General" is sole trustee of the property of the Army, which now yields an annual income of $350,000; he is empowered to nominate his successor in the trust; he can dismiss any of his "captains" at pleasure. It seems to be understood that "General" Booth is to be succeeded in command by his eldest son.

There is nothing new about the doctrines of the Army, which are those of what "General" Booth calls the "old-fashioned Gospel"—the Gospel of "a crucified Saviour, who shed real blood to save men from a real guilt and a real danger of a real hell." The Gospel is preached—and this is an essential part of the system—in the streets, wherever a crowd can be collected, and this, of course, is easiest in the worst quarters of large cities. In very low neighborhoods the Army gets possession of notorious places of amusement, which it converts into Army headquarters, and in many instances, to judge by testimony cited by Dr. Davidson, has made neighborhoods of this sort, formerly given over to vice and crime, quiet and respectable. Of course, such work as this cannot be done without risk of mob hostility and violence, and there has been much trouble in the streets, though mob persecution of the Army has only helped on the cause, as persecution in the long run must.

In the Church of England the success of the movement is watched with great and increasing interest, among other reasons because, as Dr. Davidson insists, one of the main agencies in the work is the recognition of the power of "testimony" in converting sinners, something "almost unknown in the Church of England." We are familiar enough with it in this country, but Dr. Davidson mentions with surprise that he has seen people "sit agape for half an hour listening to the same 'testimony,' repeated almost in the same words, by man after man, woman after woman, when they would not have listened to it attentively for ten minutes had it been quoted second-hand by an educated teacher." But "General" Booth and his wife, whose influence in the movement seems to be almost as great as her husband's, have greatly intensified this revival agency in the present movement. They endeavor to

make use not merely of the contagious effects of "testimony," but they rely greatly for aid on the universal modern passion for publicity and notoriety. Privacy of any kind, even in prayer, is almost unknown, if not forbidden. Sensationalism of every kind is encouraged. The Army has a press of its own, which has a large and increasing circulation, both among young and old. The *War Cry*, with a circulation of 300,000 a week, is mainly devoted not to appeal or exhortation, but to encouraging the reader, by means of accounts of the increasing success of the movement, to believe that it is a "live movement," a "big thing," which he had better join if he wants to keep up with the times. The book of "Doctrines of Discipline" contains the following advice, which it will be seen would do credit to an accomplished advertising agent: "Make your bills and posters striking in what you *say* on them, and the method of *printing*, the color of the *paper* or *ink*, the way they are *stuck up*, *given away*, and the like. They can be carried about on an umbrella, on a man's hat; round his person like a church-bell, with his head out at the top, and his feet at the bottom; on a monster box, pushed by a man or drawn by a donkey, or in ten thousand different forms. Invent for yourselves." Confession and penance are all made public, and even children are encouraged to publish letters giving accounts not only of their own spiritual condition, but of that of their parents. Thus we find one precocious correspondent of the *Little Soldier*, aged eight, writing: "I am still trusting in Jesus. I mean to fight unto the end, and give all my days to Jesus. . . . My father and mother are not saved yet"; while another, two years older, says: "Thank God, I am saved and on my way to heaven. My two brothers, George and Teddy, are saved, and baby May. I am sorry that father and mother are not saved yet, but hope they will soon. Mother is very fond of reading novels to father in bed at night."

Dr. Davidson objects to all this, and says that it is not only not Christianity, but is directly opposed to the teachings of Christ. "No body of Christians, I believe, has ever before striven thus to live their whole life in the full glare of day." A system of discipline which compels young girls to stand forward upon an open platform and confess their sins to a mob, and which encourages little children to boast of their "getting ahead" of their parents in being saved, he thinks immoral; but, curiously enough, he sees no reason why these "extravagances" should not be given up without the movement's losing its attractions. But obviously the secret of its success lies in these extravagances. There is no doubt that for large masses of people there is a far greater satisfaction to be derived from making their conversion notorious and public than from any sort of secret repentance; and the Army's use of the press stimulates this passion. The Church of England is, of all existing Churches, the one which has hitherto most discountenanced this craving, and now it finds itself confronted by a revival which, in proselyting work, outbids it by reversing the command, "Thou, when thou prayest, enter into thy closet, and when thou hast shut thy door, pray to thy Father which is in secret," making it read, "Thou, when thou prayest, go into the street, and when thou hast collected a crowd, pray as loudly as possible, and before many days thou shalt see thy name in print."

Add to this that the movement is a temperance movement conducted among the classes which suffer most directly and visibly from the effects of drink, and the reasons for its succeeding where the Church of England has confessedly failed become plainer still. Curiously enough, an attempt is now being made to adopt its methods within the Church. A clergyman in Surrey has been doing this for eighteen months, and he declares that he has found the processions, testimony meetings, and public penance work like a charm. "All our other efforts at evangelizing have failed to gather in the *lowest* classes. But since we have adopted the present methods the worst characters have been brought within the sound of the Gospel, and most encouraging instances of real conversion to God have been the result." This shows that it is really the methods which produce the effect. The Salvation Army, which goes forth even to the antipodes, has begun work in this country also, and it is, of course, impossible to predict that it may not have a considerable success here. But there is in the United States no established Church which can feel that its proper province is being invaded by the revival, and the Salvation Army will, if successful, be merely one more religious organization on a ground which is very fruitful of them. How long the converts will remain banded together in their new Church is another question.

COMMON SCHOOLS IN THE TWO CAPITALS OF RUSSIA.

ENOUGH has been said lately in newspapers and periodicals of the literary ability of Count Tolstoi, Minister of Public Instruction during the reign of Alexander II., and now Minister of the Interior, and of his zeal in founding universities and colleges (gymnasiums); but not enough of his narrow-mindedness and his infatuation with his own schemes. He founded new universities and professorships, and made laws to suppress the independence of science; he increased considerably the number of classical gymnasiums, and decreased the number of Real and commercial schools: Latin and Greek alone were to save Russia. For elementary instruction Count Tolstoi did less than nothing. Of the truth of this assertion, an essay entitled "The Common Schools in Moscow and St. Petersburg," by Baron N. A. Korf, in the June number of the *European Messenger*, furnishes abundant proof:

"If Russia had," so he begins, "only the hundredth part of all the excellent institutions decreed by legislation, she would be one of the happiest countries on earth; but it is well known that she has not: the law is one thing, the reality quite another. It would be useless to enumerate the laws which are not carried out, and more useless still to recite those which are entirely unaccomplishable."

Russia had a school-law as early as 1763 (France had none until 1794). Catherine, in the year 1775, ordered "schools to be established in all cities, towns, and larger villages of the empire," and at her own expense opened a public school in St. Petersburg (1781); but, unfortunately, she did not find as many imitators in this action as in her vices. The number of public schools in the first capital of Russia was in the year 1802 but thirteen. Then the Ministry of Public Instruction was established, and great progress was expected. After three-quarters of a century (1877), St. Petersburg had sixteen public schools! The communities repeatedly asked the Ministry's permission to establish schools on their own account (for instance, St. Petersburg in 1867), but the answer was always a refusal. Large numbers of children not being able to find room in the few schools of St. Petersburg, the city proposed to satisfy their desire for learning by temporarily introducing so-called after-dinner-schools. The very same Ministry which constantly overburdened the young students of the gymnasiums to an alarming degree, rejected the city's proposal, because after-dinner-schools were "contrary to the laws of modern pedagogics and hygiene." Another city offered the public schools a collection of books; they were not accepted, because their titles were not in the catalogue of useful books published by a committee of the Ministry of Public Instruction. Even now, when the cities have finally got to a certain extent the right of self-government in these matters, granted years before to the provinces and districts, the Ministry seems to be a constant hindrance. In 1878 the city of Moscow wanted to establish a higher school for girls under the name of "Alexander School." The permission of the Ministry was solicited, and, after a delay of fully ten months, the Minister (Count Tolstoi) deigned to reply that he could not agree to the name of the new school. The Duma (Board of Aldermen) of the city of Moscow wisely decided to give up the project altogether.

The number of pupils taught (which is more important than the number of schools) is now increasing in both the capitals—in Moscow, where there has always been more interest in public affairs, steadily; in St. Petersburg, where the public schools up to 1877 were unpardonably neglected, rapidly. In addition to the increase of schools and of pupils taught, we notice a far greater increase still in the number of children turned away for want of room. During the last four years not less than 6,945 children, all eager to learn at least to read and to write, could not be admitted to the public schools of St. Petersburg and Moscow, as the following tables will show:

Year.	Moscow.			St. Petersburg.		
	Schools.	Pupils.	Refusals.	Schools.	Pupils.	Refusals.
1870	6	350	....	....	....	....
1875	23	1,950	....	....	....	....
1878	33	3,506	877	23	899	326
1879	38	3,862	917	51	1,890	763
1880	40	4,138	1,147	53	2,362	600
1881	43	4,691	1,516	88	4,074	799

The age at which pupils enter the schools varies very much. In the capitals and other larger cities children from four to five years of age often apply for admission, and at St. Petersburg 91 per cent. of all pupils are under twelve years. In the country, children seldom enter school before their ninth year. Moreover, in the country they are without all preparation whatever, while in the cities one-half generally know at least the rudiments of reading and writing (they are, as the Russians say, *gramotniye—i. e.*, knowing the γράμματα). In Moscow there are among the new scholars only 51 per cent. ignorant of the rudiments, or "negramotniye" (47.6 per cent. boys, 55.3 per cent. girls).

The school year consists of 200 days in Moscow and St. Petersburg, of four hours a day (800 hours); of 120 days, six hours a day (720 hours), in the country. Notwithstanding this fact, the results are considerably better in the

provinces than in the capitals. Here the children are too young and leave school too early, eager to earn a living for themselves. The Moscow schools have in the highest of the three grades only 15 per cent. of all the pupils; in the district of Mariupol, Province of Yekaterinoslav (which, by the way, has only one-sixth of the population of Moscow, but quite one-half as many pupils in the public schools), 21 per cent. of all the pupils are in the third division. The average attendance in Moscow is 94 per cent. The education of women, considered a luxury among the lower classes in Russia until recently, is becoming more and more common. Out of the 4,691 pupils in Moscow, 2,284 are girls; in St. Petersburg, out of 4,074, there are only 1,368 girls.

A great obstacle, in the cities as well as in the country, is the poverty of the parents. Hundreds of poor children cannot attend any school in the winter-time because they have no shoes. One sees often in schools, as a part of the furniture, from six to a dozen pairs of shoes of different sizes, to be lent to the freezing pupils until their own are mended. In Moscow, the teachers distribute to the children brown bread and salt, for which entertainment the city spends 11,000 rubles a year. Another serious drawback is that the children have to pay for their instruction. The annual fee in St. Petersburg is two rubles, and two rubles fifty kopecks for slates, text-books, and stationery; in Moscow a pupil pays, altogether, three rubles a year (about $1 80; St. Petersburg, $2 70).

The male teachers come generally from theological seminaries, where, for one reason or another, they have not been able to pass the examination for entrance into the priesthood ; the lady teachers (more than one-third of the total number) are graduates of the female colleges (gymnasiums), or of some of the higher private institutions. The remuneration is exceedingly low. From 1802 to 1877, a teacher in one of the thirteen or sixteen public schools of St. Petersburg got 171 rubles 59 kop. a year ($103) ; now the pay is much better, but still bad enough. In St. Petersburg, a teacher (male or female indifferently) receives 600 rubles ($360) a year, and lodgings ; in Moscow, the first male teacher of a boys' school, 500 rubles ($300) ; the first lady teacher of a girls' school, 400 rubles ($240); the assistant teachers (nearly all ladies), 300 rubles ($180). This salary increases in Moscow every three years (a system not known at St. Petersburg), until the following maxima are reached: for a first male teacher, 750 rubles ($450); for a first lady teacher, 600 rubles ($360).

In St. Petersburg every teacher has fifty pupils in his class-room, and these belong to the three different grades. Moscow has, in this respect, truly model schools, from which our own cities could learn much. There one teacher teaches scholars of only one grade; in the first and second grades the maximum number in a class is 35; in the third grade the maximum is 30, the minimum 8, the average 20 pupils. It is, therefore, not surprising that the schools of Moscow are far ahead of those in St. Petersburg. In the latter city the children are taught only reading, writing, arithmetic, and composition; in the former they acquire, besides, a certain proficiency in freehand, linear, and perspective drawing. The elements of the natural sciences are taught nowhere, whether because the Russians have great talent for them, or because the Church tries to keep the human mind away from science.

In both the capitals the schools are provided with sufficient, sometimes even luxurious, furniture and apparatus; but neither St. Petersburg nor Moscow owns a public-school building—obviously a very serious deficiency. Moscow, however, is about to erect a commodious school-house for 400 children, at a cost of 120,000 rubles. Class-rooms are hired in private houses; yards or gardens are rare. The authorities of St. Petersburg, at all events, enforce strictly the law providing 100 cubic feet for each pupil; in Moscow this number descends to 73 (in one house even to 66) cubic feet a pupil.

In both cities the Duma (Board of Aldermen) has control of the common schools. There exists, however, in Moscow a Board of Education, constituted in the best possible way. Ladies and gentlemen who take an interest in public education send their names to the Duma; this body selects the necessary number, and invests them with the necessary rights and powers. It is easy to comprehend that a board like this is much more useful and more apt to have new and better ideas concerning the improvement of the schools than a board the large majority of which has no understanding of school business whatever, and of which too many members feel no interest at all in their office except in so far as it may advance them in their political aspirations. The Duma of St. Petersburg appoints a physician for every school, who has to visit the class-rooms regularly, and upon whose certificate a pupil must be received in the city hospitals at once and without charge. A private society for the aid of poor school-children has recently been founded, the members of which not only furnish clothing, food, and, if necessary, lodging for the indigent, but will insure the most promising higher professional education. It is, of course, a great encouragement for poor children to be under the protection of this society, and as the members, at least so long as there is no compulsory education, attend only to the children enrolled in public schools, these schools have a new attraction for the poor and needy.

The annual cost of each pupil in the schools of Moscow is 40 rubles, 50 kopecks ($24 30), in St. Petersburg, 37 rubles, 20 kopecks ($22 32); but though the expense is nearly the same in the two cities, Moscow accomplishes much more. Here the expense for common schools is 3.84 per cent. of the whole budget; in St. Petersburg, merely 1.33 per cent. There are only two towns which spend comparatively so little for educational purposes as the first capital of the Russian Empire. In thirty provinces together, in 1868, 5.1 per cent. of all revenues were spent for popular education.

Some of the larger Russian universities are excellent, and many of the professors of the younger generation would be an ornament even to a German or an English university, but the universities are the "couronnement de l'édifice," and a reasonable architect begins with a solid foundation; the public schools are this foundation. In the few years of partial self-government, Zemstvos and Dumas have accomplished comparatively much. If undisturbed, they will build a strong fortification against Nihilism and thoughtless revolution, as well as against despotism.

THE DEBATE ON THE EGYPTIAN QUESTION.

LONDON, July 29, 1882.

LIKE a stone pushed down the side of a mountain, which at first rolls slowly, then, gathering momentum, flies along by leaps and bounds till it thunders into the valley, this Egyptian crisis, which in its earlier phases was so tedious, has latterly advanced with a speed that hardly leaves us time to apprehend and judge the situation into which England has come, before we find ourselves in a new one. In my last letter I described to you the sentiments excited by and views expressed regarding the bombardment of Alexandria, which ushered in a new act of the drama. This was followed by the negotiations intended to bring about a Turkish intervention—negotiations conducted by the Conference of Ambassadors of the six Powers at Constantinople. I do not intend to describe the action of that Conference, which, as you may remember, the Sultan refused to enter, and did not even formally recognize. It—or rather the several Powers represented in it—invited the Turkish Government to intervene by arms in Egypt, and the Sultan delayed so long and shuffled in so irritating and obviously dishonest a way that the patience of England was exhausted. Between the danger of appearing to attack a Mohammedan leader who was resisting a Christian Power in a Mohammedan country, and the other danger of seeing that Christian Power take the matter into its own hands and thereby weaken the hold of Turkey over her dependency, the Turks could not make up their minds what course to follow, and continued, in their usual fashion, to interpose delays, hoping that Fate would somehow solve the problem for them, and no doubt encouraged by the caution and apparent hesitation with which England and France had hitherto acted.

After the bombardment, however, England could no longer afford to move so deliberately. The position had become for her a most difficult one. Alexandria was in ruins. She had to keep order there and defend herself against the attacks of the army of Arabi, which held the country. The navigation of the Suez Canal was imperilled. What was practically a state of war existed, and yet she was not technically at war, and could not well proceed to invade the country. Besides, everybody in England itself was calling out for something to be done, some resolution taken ; and the Ministry were badgered five days a week with questions in Parliament about everything they did or left undone. Accordingly they suddenly determined to wait no longer either for the Powers, or for France, or for Turkey, but to act alone, on their own responsibility, and intervene in Egypt for the purpose of restoring order there by expelling Arabi, breaking the power of the Army, and reëstablishing the Khedive at Cairo. The constitutional way of taking such action is, of course, to obtain a vote of money for the purpose from Parliament, and this has just been done. They announced on Saturday, the 22d, that they would ask for £2,300,000 for the purposing of strengthening the Queen's forces in the Mediterranean ; they moved for this vote on the 25th, and obtained it on the 27th, after a debate of three nights. As regards the other Powers of Europe, they intimated that since something must be done, since Turkey had not undertaken to do it, since it did not appear that the Powers collectively desired to take action for the purpose, since England had always taken a leading part in the affairs of Egypt, and had special interests there, she proposed to act alone, not adversely to them or any one else, but simply in default of steps being taken by any one else. France was, of course, invited to join; but France declared that her action would be limited to the protection of the Canal, and it is now (while I write) doubtful whether she will undertake even so much as that. Neither she nor the other Powers are, however, entitled to complain, for England has consulted them at every step, has given them the opportunity of joining, and cannot be expected, where she feels her own duties or interests involved, to hold back merely because they will not go forward.

It is toward Turkey, however, that the game has been most intricate and most entertaining to the lookers-on. When it was announced that England was going to proceed alone by landing an army in Egypt, the Sultan screwed himself up to the point of saying that he would enter the Conference. When news reached him that Eng-

lish preparations were being rapidly pushed forward, he declared he would himself intervene, but that the conditions which the Conference had laid down were inadmissible and must be revised. When he perceived that this declaration did not arrest Mr. Gladstone's movements—for that statesman, on being asked in Parliament what his Government would do in consequence of the change in Turkish policy, answered that it would go on just as before—he threw all his hesitations and procrastinations aside, and proclaimed that a Turkish force would be forthwith despatched to Egypt. This is the last move we have yet heard of. It has been met by an expression of the willingness of England to receive Turkish troops to coöperate, provided that the Sultan takes the preliminary step of proclaiming Arabi a rebel, and exerting his moral influence against him and his associates. Before this letter reaches you, you will know how the Sultan faces this fresh difficulty. It will not be very easy even for him to denounce a chief upon whom he conferred a high decoration a few weeks ago, and who is regarded by zealous Mussulmans at Constantinople as a champion of the faith; and probably several further moves may have been played in the game, which it would be no use trying to predict. It is the feeling in England itself that I wish to endeavor to convey to you.

There was nothing that we expected less three months ago, and certainly nothing that we desired less, than to send a fleet and army to guard and occupy Egypt. We were entirely occupied with domestic difficulties. The Egyptian question had never laid hold of the national mind. It was so extremely complicated that even professional politicians shrank from mastering it, while the general public left it altogether on one side. Even now hardly anybody outside the relatively small circle of members of Parliament and journalists professes to understand it. The vast majority of the Liberal party were so much disgusted by the foreign policy of Lord Beaconsfield's Government, and still more by the cynical grounds on which it was advocated, as to have become opposed to almost any kind of intervention abroad. Two principles had become to them axioms: one, that war was so great an evil that scarcely anything but the necessity of repelling an attack would justify it; the other, that the engagements and responsibilities of Britain in every part of the world are so numerous and heavy that they ought not to be increased, and least of all by the acquisition of fresh territory. Hence the idea of occupying, perhaps after a serious struggle, a country like Egypt, as to which other European Powers are very sensitive, and where we may have to stay longer than we like, had a great deal of reluctance and dislike to overcome in the mind of the ordinary intelligent Liberal—the sort of man who, as the chairman of the committee of a local Liberal association, or as a Nonconformist minister, or a speaker at workingmen's meetings, or the editor of a provincial newspaper, forms, as well as represents, the opinions of those voters who placed the present Government in power. An expedition to Egypt, and the suppression of what has been represented as the National party there, looked suspiciously like a repetition of Lord Beaconsfield's conduct in Afghanistan, or his snatching of Cyprus. And, in fact, the Tory party, while approving the determination of the Government to intervene in Egypt, could not abstain from taunting them with being mere imitators of their predecessors, and following the very course in office which they had denounced in opposition. There are caricatures in the shop windows which represent the present Prime Minister trying to "make himself up" so as to look like the last one.

These things being so, why has the action of the Government met with so little opposition (and I do not speak merely of Parliamentary opposition, but of hostility from the organs of public opinion throughout the country)? Two reasons may be assigned. The first is the extent to which the interests of British commerce are involved in Egypt, and still more in the navigation of the Suez Canal. A good deal of the finer qualities of cotton comes to us from the delta of the Nile, and many English houses have become, in one way or another, so connected with the Alexandrian trade that anarchy in Egypt would mean serious loss to them and to those whom they employ. People outside that special circle, but either dependent in some way upon the prosperity of our commerce or connected with India, think that the destruction of the Canal, or even its temporary stoppage, would be a national misfortune, and are therefore ready to justify measures that seem required for its protection. To their fears it is replied that the Canal is not seriously threatened; that whoever reigned in Egypt would willingly see it open; that it can be protected without conquering the whole country. But these arguments do not make much impression against the deeply-rooted belief that somehow or other this international highway must be secured, and that we are more concerned than any other nation to have it secured.

As this consideration has much weight with the commercial and moneyed sections of the Liberal party, so the other sections, and particularly the Nonconformists and the working classes, are swayed by another, possibly even more important. This is personal confidence in Mr. Gladstone, a belief in his honesty, his fidelity to his principles, his aversion to war and aggression. "If he has gone into this enterprise," say his admirers, who are the real strength of the party, "it is because he has felt it unavoidable. He must dislike it as much as we do. He knows better what the dangers are than we do: if he thinks these strong remedies required, he is more likely to be right than we are; and we must follow him." So strong is this feeling that even the retirement from the Ministry of Mr. Bright has not sensibly weakened it. Much as he is personally respected and trusted, the great orator of the Radical party has never been a fighting leader, never awakened the same personal enthusiasm that Mr. Gladstone has done and still does; and though he is younger in years, he belongs more distinctly to a past generation, and is supposed, at least, to be less in sympathy with the new turn and color which Liberalism has of late years taken.

Owing to this general disposition of the Liberals to support Mr. Gladstone, and owing also to the fact that the Conservatives could not, consistently with their own principles of foreign policy, oppose armed intervention in Egypt, the debate in the House of Commons on the vote of £3,200,000 was somewhat spiritless. The opposition to it, which ended in being supported by nineteen members only, came from those followers of Mr. Parnell—not more than half his party—who have remained till this late period of the session, and from a small group of English Liberals who condemn all foreign intervention, and indeed all war that is not purely defensive. Few in number, these members are respectable from their consistent zeal and the purity of their motives; nor is it to be denied that they represent a considerable body of opinion among the working classes. Some others, though not going so far as to vote against the grant of money, refused to vote for it; and a good many thought, though they left it to the Conservative Opposition to say, that the Government had not managed things in the best way, but ought to have foreseen the approaching dangers, and either sooner invoked Europe to deal with them, or else itself nipped them in the bud. The Opposition, however, is not oratorically strong, and inflicted little damage on the Government; so that the chief net result of the debate has been, while not seriously weakening them, to enlighten the country on the question generally. Two remarkable speeches were delivered. In one of them Mr. Thomas Bruce, brother of the late Lord Elgin and of Lady Augusta Stanley (Dean Stanley's wife), a Conservative of advanced age and moderate views, gave a singularly lucid and instructive account of the state and changes of Egypt during recent years, showing how interwoven she had become with Western interests, and how much the difficulties of England and France there had been increased by the action of France in Tunis and the passions which she had roused among the whole Mussulman population of Africa. The House of Commons is very intolerant of disquisitions, but very ready to listen to a man who possesses special knowledge and rarely obtrudes it; and as Mr. Bruce has been for many years connected, as the head of the Ottoman Bank, with Eastern financial affairs, his approval of the general policy which the Government had pursued was felt to be weighty. Still more important was the authority of Mr. Goschen. Having been concerned in the establishment of the Financial Control in Egypt in 1876, and having served as Ambassador at Constantinople in 1880, he has more direct knowledge of Eastern topics than any other statesman of nearly equal rank and ability. He pointed out with great force that England's position, not only toward Turkey, but toward the Christian subjects of Turkey, forced her to interfere; condemned in weighty terms the duplicity of the Sultan's Government; explained, while regretting, the hesitations and timidity of France; and made in some respects a better case for the Government than diplomatic reticence permitted them to make for themselves.

Although, however, the general result of the discussion has been in favor of Mr. Gladstone's policy and Ministry, its position is still a very delicate one. Any serious misfortune in Egypt, any misunderstanding with France or the other European Powers, might imperil it. Yet even then it would have the advantage of being able to ask the country whether a Conservative Government, headed by Lord Salisbury, would be likely to do any better. Y.

(From another Correspondent.)

LONDON, July 29, 1882.

THE debates in the Houses of Lords and of Commons previous to entering upon direct hostilities in Egypt have done much to clear up the situation and explain the present policy of the Government. Lord Granville, Mr. Gladstone, Sir Charles Dilke, and Mr. Chamberlain have expounded the difficulties which have had to be encountered by the Government, and the modes in which, both in theory and in practice, they have been surmounted. Lord Salisbury, Sir Stafford Northcote, Colonel Stanley, and sundry Opposition sharpshooters, have done their utmost to criticise without exactly obstructing, and have had their say. Sir Wilfrid Lawson and Mr. Richard have stated in the fullest form the arguments, of all kinds, in favor of peace everywhere and always, and most of all in favor of peace with Egypt at the present moment. The subject has, undoubtedly, been thoroughly threshed out from all points of view, and, as it is inherently a difficult one, the conspicuous advantage of parliamentary institutions in the way of educating the popular mind has been seen to the full.

The first thing to be noticed is, that the defenders of the "National party" as represented by Arabi Pasha have cut a very poor figure, or rather evanesced altogether. Even those who, like Mr. Chamberlain, have admitted that there may be in Egypt some independent movement of a patriotic sort directed against European intervention, have strongly and decisively resented the notion of Arabi representing any such movement. Speaker after speaker on the Government side pointed out how every step in Arabi's advance was directed to his own promotion and enrichment: how the Chamber of Notables, illegally summoned by himself without the Khedive's consent, repudiated him and cooperated to promote his expulsion from the country; how, in destroying Alexandria, he committed (as one speaker said) one of the greatest crimes of this century; how, by disobeying both the Sultan and the Khedive, whom he professed to obey, he brought about the bombardment; and how, from first to last, everything he had done had been productive of nothing but ruin to his country. Mr. Gladstone, indeed, generalized on the necessarily pernicious character of every military despotism, even when the despot had some personal qualities to recommend him, and he took the instances of Cromwell and the Napoleons. These reigns, said Mr. Gladstone, did not advance public liberty, but retarded it; and the constitutions of England and of France only began to progress when the military despotism in each country came to an end.

Sir Charles Dilke explained with the greatest exactness and elaborateness the intervention of England in Egypt, as justified by the Government. He said this intervention was to be defended by necessity, right, and duty. He based the special claims of England to intervene on the treaty for the pacification of the Levant of 1840, by which Mohammed Ali was recognized as the supreme ruler of Egypt, and his dynasty established, subject to his conforming to certain conditions, which he conformed to a year after. Sir Charles Dilke, in one part of his speech, more especially addressed members on his own side of the House. He submitted to them that a policy of absolute non-intervention had never been part of the Liberal, or even of the Radical, creed. He justified the bombardment by pointing out that if the fleet was at Alexandria for an undoubtedly legitimate purpose, it was surely necessary to protect it. The Government had no right to expose their men to a daily increasing danger. He could not perceive anything contrary to Liberal or Radical principles in striking hard when British representatives were threatened. Sir Charles Dilke defended the Government against the imputation that they ought to have had a large landing force ready, by saying that, in the then political circumstances, it was impossible to have a large landing force. "It was one thing to act in self-defence, and another to undertake what they had undertaken not to undertake—namely, isolated action."

Mr. Chamberlain made a most effective speech by dwelling on the extraordinary amount of the interests which England had in Egypt, in which he especially included the number of persons who had been induced to trade in the country by the promise of security. While he admitted that those who speculate in foreign countries must take the consequences of the risks they encounter, he at the same time resented the notion that all persons who lend money to foreign states were unworthy of the least consideration. His words were a little vague about the future of the bondholders: he hinted that hereafter they must make their own arrangements for themselves. This might refer only to future creditors of Egypt, or it might mean that England would not trouble herself any more to carry out the existing arrangements for the liquidation of the debt. From other assertions of Mr. Gladstone, it would seem that the last is not the meaning. It is probable that the Conservative party will not encourage Egyptian repudiation, and a large party among the Liberals will join to resist any change in the working of a scheme of liquidation which has once been deliberately settled by the British Government, and round which complicated vested interests have grown up.

The main controversy between the Government and the Opposition has turned upon how far the present troubles in Egypt and the resistance to European influence have sprung from the institution of the dual Control, and to what extent this Control owes its recent character to the acts of a Conservative or of a Liberal Government in England. It is argued by the Conservatives that the most they did in instituting the original Control in 1876 was to help the Khedive Ismaïl in arranging with his creditors and preparing his accounts according to European methods; and for this purpose skilled European financiers were attached to the Egyptian Cabinet, to be permanently at hand as supervisors of all liabilities and expenditures incurred from time to time. The Liberals reply that mere clerks with financial experience would have served so much of this purpose as was not unjustifiable intervention on the part of England and of France; and that there was contained in the original dual Control the probability and, indeed, the necessity of political aggression. To this some (but not all) of the Conservative speakers reply, that neither the original Control of 1876 nor the revived and amended Control of 1879 contained the necessary elements of political aggressiveness, but that the careless diplomacy of Mr. Gladstone's Government, and their ill-fated attempts to coöperate with France, and withal to conciliate Turkey, brought about a state of things which left Egypt defenceless before the first shock of revolution.

Lord Salisbury pointed out that there is always much in diplomacy, and in the printed records of diplomacy, which does not meet the eye; and this argument—which was introduced for a different purpose—may be used for the defence no less than for the defamation of the Government. There is no doubt that the difficulties which the English Government have encountered in conciliating and coöperating with the French in Egypt have been greater than will ever be told. It has been seldom that a French Consul-General, Commissioner, Controller, or Administrator has been of one mind with his English colleague, or indeed has not been silently and secretly counter-plotting him. At the last, it was transparent that the attitudes of the English and the French officials in Egypt were quite opposed on the critical question of the day, the French being disposed to compromise with Arabi, and the English consistently viewing his pretensions with uncompromising opposition.

The speeches of Mr. Goschen, Mr. Bourke (Under-Secretary of State for Foreign Affairs in the last Conservative Government), and Sir H. Wolff, on the third day of the debate, brought out into clearer relief some historical aspects of the question, as affecting the responsibilities of the Conservative and the Liberal Governments for the present state of things. Mr. Goschen's speech has been more commended on all sides than any other single speech in the course of the debate. His personal experiences as adviser of the Egyptian Government at the time that the British Government first lent its services to Ismaïl to liberate him from his insolvent condition, rendered him an authority of the highest kind at this crisis. He assured "those who took an interest in such matters as the slave-trade, the better government of Eastern Rumelia, and the position of the Christian population in Armenia, that those objects would not only be compromised, but in all probability frustrated for ever, if England were to allow herself, by the terrorism of massacre, to be driven out of Egypt." Mr. Goschen, also, was strongly of opinion that, as far as military and naval operations went, the Government should act alone. He derided the notion of any value attaching to the "moral support" of Turkey, and pointed out that France would be hampered in her action in Egypt by the possible enemies on her borders, and by the weakness of her successive Governments, which prevented a continuity of policy being insured. Mr. Bourke imputed to the Government that they had not been firm enough with the French, but had tacitly accepted all their policy throughout, including that by which, when the insurrection began, the French set themselves decisively against all physical or moral intervention. "Her Majesty's Government ought," he said, "to have told France fairly and broadly that they could not follow the policy she had marked out."

Mr. Gladstone, in summing up the debate on the fourth day, mainly rested the whole defence of the Government policy on the inherent difficulties of the position created by the dual Control. He admitted that when the Control was first inaugurated it was not intended directly to intervene in the government of Egypt, but he held that the revived Control, as recognized by Lord Salisbury in 1879, at the outset of the present Khedive's reign, involved by its nature political interference. It was the Controller who had come into direct conflict with the Chamber of Notables, and who had called upon the British and French Governments to part company with it at a moment before Arabi had acquired complete domination over it, and identified the military with so much as existed of a national party. Finally, Mr. Gladstone insisted strongly on the value of the efforts his Government had made throughout to obtain and retain the cooperation of France, even at the risk of making considerable concessions, such as those which related to inviting the aid of Turkey. He was of opinion that but for conciliating France throughout, a general European war might have resulted.

The vote of credit was agreed to by 275 against 19. The minority was composed, in a large measure, of Irish members, followers of Mr. Parnell, besides Sir Wilfrid Lawson and Mr. Richard.

It will be seen that all sides of the House are, with rare unanimity, agreed on the substantial facts of the case, and eager to support the Government policy, the main point of disagreement having relation to the history of the Control and the advisability of deferring so constantly to France and the other European Powers. A.

THE RESTORED CASTLE OF CHANTILLY.

PARIS, July 20, 1882.

THE restoration of the Château of Chantilly was undertaken by the Duc d'Aumale as soon as he returned from his long exile in England, after the war of 1870. It showed no small confidence in the country, which had just got through the horrors of the Commune; but if anybody had the duty of giving to France such a mark of confidence, it was the descendant of the old royal family which had ruled over it for centuries. The Château of Chantilly was originally a little stronghold, built on a sort of rock, surrounded on all parts by marshes and by the branches of a little river which is called the Nonette. This little fortress played a part in

the long wars between France and England at the time when the river Oise formed the disputed boundary between the French and the English. The first proprietor of the Château was Bouteiller of Senlis; it passed afterward into the hands of the Montmorencys, who kept Chantilly for a very long time—the great Constable Montmorency chose it for his favorite residence. It came into the Condé family when the last Montmorency was beheaded for treason, by order of Richelieu; Louis XIII. confiscated the estate, and gave it to Montmorency's widow, who was a Princess of Condé. The estate remained in the hands of the Condés during the seventeenth, the eighteenth, and the beginning of the nineteenth centuries. The last Duc de Bourbon, who had no children, left it by will to the Duc d'Aumale. The Château had many vicissitudes, in an artistic as well as in an historical sense. It was once a castle of the Middle Ages; it was rebuilt in the fifteenth and the sixteenth centuries, and you will find in Du Cerceau's great architectural work excellent drawings of it as it was built by the famous Jean Bullant. The Duc d'Aumale has in his archives some accounts of Jean Bullant, in which he modestly styles himself mason, not architect.

There remains a part of Jean Bullant's work completely intact—namely, the little castle, or lower castle, called the Châtelet. There were always two castles, a low one and a higher one, separated by a moat and connected by a drawbridge. The Châtelet is admitted by all architects to be a model of the architecture of the French Renaissance; they admire the originality and simplicity of its lines, the beautiful proportion between the *pleins* and the *vides*—that is to say, between the openings (windows or doors) and the solid parts or walls, the forms of the roofs and chimneys, the sobriety and elegance of the whole building. The moat which separated the Châtelet from the Château no longer exists, and the Châtelet is attached directly to the Château. This last building was not always the gigantic pile which you see in Du Cerceau. Built on a polygonal basis formed by the rock itself, this substructure, with its vaults and galleries, has never been changed, but the castle which was standing on it was completely altered: it had become, at the end of the eighteenth century, a sort of immense and ugly barrack, limited by four towers at its corners. After the French Revolution this was completely demolished to the level of the substructure, and there was nothing left over the kitchens, vaults, and underground galleries but a large polygonal terrace.

It is on this terrace that the Duc d'Aumale has built the new Castle, which he has opened recently to the public. The general, I might say the universal, impression has been very favorable to this reconstruction. The new Castle is in the style of the French Renaissance; it is inspired in all its details by the admirable Châtelet of Jean Bullant. You approach it by a road which leads to a great terrace, in the middle of which is the model of the equestrian statue of the Constable of Montmorency, which is in preparation in the atelier of Dubois, so famous already for his admirable tomb of Lamoricière. The Duke chose Dubois for this work though he had never made a horse; but Dubois is intelligent, he knows the best models, he has worked very hard on the anatomy of the horse, and we may be sure that his definitive work will be fine. The figure of the Constable, as it is now, is fine: the old warrior carries the sword of Constable in his hand, and he seems to stop his horse before the door of his castle. He stands directly opposite the great entrance, which reminds one a little of the famous *cour du baptistère* of Fontainebleau. A bridge connects the terrace of the Constable with the high inner court, and the court has in front a high and open portico. The great central door is adorned with two excellent copies of the "Slaves" of Michael Angelo. The Duc d'Aumale remembered that the original "Slaves" (which were destined for the tomb of a Pope) had been presented to the Constable of Montmorency by a Strozzi, who had been obliged to exile himself from Florence, and who had taken service in the French army. These two statues had been afterward left by the last Montmorency to Richelieu, who gave them to the King; and they are now in the Museum of the Louvre. When you enter the *cour d'honneur*, as it is called, you find in the left corner of the court the Chapel, which is not yet finished inside. It is a little jewel of architecture, adorned on the outside by a statue of Saint Louis, who carries in his hands a crown of thorns. The glass-windows come from the Château d'Écouen, which belonged to the Montmorencys; they represent the Constable and his wife at prayer with their numerous children. The altar comes also from Écouen; it is a very fine work of the Renaissance, of which the centre-piece is the sacrifice of the son of Abraham. The woodwork which will cover the walls is of great beauty, but is still in preparation.

Let us leave the Chapel and enter into the first hall. This hall is at the head of a beautiful elliptical staircase, which now connects the lower building, or Châtelet, with the higher building. The staircase and the hall are considered very original by all architects. The decoration is severe: it is made with old pieces of faïence, with bronze and marble busts, with old tapestry; but the bare stone predominates, and gives a noble and palatial look to the whole. This hall leads on one side to the upper story of the old Châtelet, of which I will not speak at present; and on the other side to the interior of the new building. First comes the dining-room. There is nothing finer in Fontainebleau than this gigantic hall, adorned with magnificent tapestries of enormous size, representing the various episodes of a stag-hunt. These tapestries, which are called the tapestries of the Guises, received new borders at the time of the Comte de Provence; they were made in Flanders, and their coloring is remarkably well preserved. The roof, which is all in compartments (*caissons*), shows the arms of all the various proprietors of Chantilly; the cornice is adorned with a series of stag-horns. The head of a white stag (a variety now extinct, once imported from Lithuania), comes out from the wall and makes a fine effect. Over the huge chimney, Baudry has painted the miracle of Saint Hubert. The saint, who was a Merovingian warrior, has dismounted; a page holds the head of his horse. He climbs the rocks, surrounded by his dogs, and sees before him the white stag, with a brilliant cross between his two horns. Baudry has given to the Saint the likeness of the Duc de Chartres, and the young page resembles exactly the Duc d'Orléans, the son of the Comte de Paris. The windows of this huge hall are replaced at night by mirrors; windows and mirrors are movable, like doors which run on wheels; they can retire into the wall or come out at will. The effect at night is very fine when all these mirrors reflect the light of the bronze torches, copied from Venetian models. Over the door there is a great balcony, large enough to receive a band of musicians, who play during the gala-repasts. The table can receive eighty guests; but it can be so subdivided that any inferior number of people can be accommodated.

The banqueting-room opens on the great picture-gallery, which deserves a long description by itself. The collection is chiefly composed of that once owned by the Prince of Salerno, who was the Duc d'Aumale's father-in-law. The Duke bought it when the Prince died. The pictures are perfectly authentic, have suffered no indiscreet restoration, and were for a very long time in the hands of the royal family of Naples. There are some fine pictures by Carracci, by Titian, by Poussin, by Morone. The other pictures noticeable in this gallery are, the view of Scheveningen by Ruysdaal, some fine Vandeveldes, a great number of Decampses, a Meissonier, some Horace Vernets, Philippe de Champagnes, Ary Scheffers, a great number of portraits of the last century. At the end of the gallery there is a tribune of a circular shape, which is in one of the towers of the Château. It is devoted to Prudhon, and completely covered by his admirable drawings. From the windows of the tribune of Prudhon one sees the magnificent gardens designed by Lenôtre, the *parterres* with their marble statues, their basins, their water-works. This French garden extends as far as the great moat, which was the work of the Grand Condé.

A long gallery runs along one of the faces of the Castle. It shows the *vitraux* of Écouen, representing the history of Psyche, from the drawings of Raphael. These windows are a monument of art. They were made in the sixteenth century, and are extremely interesting on account of their origin and of the singular beauty of the drawings of Raphael. The wall which runs opposite the windows showing the history of Psyche is quite covered with a collection of historical portraits by Clouet and his school. You can see there the most authentic portraits of the Prince of Orange, of Coligny and his brothers, of the first Condés, of the Valois, their wives and their children.

From this gallery you go into the *Tribune*, another tower with a circular room. Here are the gems of the Duke's collection, of which I reserve a description for another letter. The *Tribune* leads back by a small passage into the great banqueting-hall. The surface of the Castle's polygon being very irregular, the architect was obliged everywhere to adapt his plans to this irregularity. He has united the towers by galleries. This want of symmetry is pleasing: it gives originality to the whole work, and from the windows the view is ever changing. M. Daumet, who made this restoration, has been recompensed for his labors by a high prize of the Institute.

"PARSIFAL" AT BAYREUTH.

THE FIRST PERFORMANCE.

BAYREUTH, July 26, 1882.

AT ten minutes past 4 yesterday the first performance began. The introduction to "Parsifal," which unites some of the most charming motives in the drama, is a symphonic prelude of wonderful beauty, destined soon to become a favorite in concert halls. Before its last notes have died away the curtain parts in the middle and shows the spectator a shadowy but not gloomy landscape in the neighborhood of the Castle Monsalvat in northern Spain, the Grailsburg, which was built by *King Titurel* and his knights as a sanctuary for the holy grail that was brought to them by angels. The grail has the same qualities that the earth has for Antæus, or Freia for the gods in Walhalla—it rejuvenates and invigorates the holy knights who are privileged to behold it whenever the King uncovers it, and it thus enables them to perform their duties, which consist in punishing misdeeds and defending innocence among mortals, as we see in the case of *Lohengrin*, in Wagner's drama, who goes forth on his swan-boat to protect *Elsa* from her unjust accusers. When *Titurel* found the end of his allotted life ap-

proaching, his son *Amfortas* was crowned king of the brotherhood. But *King Amfortas* succumbed to a temptation which had already brought misfortune to many of his knights.

Not far from Monsalvat is the castle of *Klingsor*, the wizard. *Klingsor*, the representative of heathen sensuality, had once endeavored to secure admission to the holy brotherhood. But he lacked the requisite purity of heart and conduct, and freedom from worldly desires, to obtain which he resorted to self-mutilation. Repulsed from the Grailsburg, he swore vengeance on the knights, and in his magic castle he now holds many of them as captives to the charms of his lovely maidens. *King Amfortas*, when he went forth to annihilate the sorcerer and his castle, fell a victim to the wiles of *Kundry*, the most beautiful of the unhappy females enslaved by *Klingsor*. *Kundry* is a sort of female wandering Jew, the Herodias of German legend, who laughed at the Saviour when he bore his cross. For this she was condemned to "cursed laughter," and to wander about the earth until she could again find a saviour to release her from her curse by his love. *Klingsor* had gained control over her through his magic arts, and now compels her to aid him in reducing the number of faithful knights, so that he may ultimately satisfy his desire of gaining possession of the grail. While *King Amfortas* is ensnared by *Kundry's* charms, *Klingsor* snatches from him his holy spear—the spear with which Longinus had pierced the Saviour's side, and which *Titurel* had received with the grail. With this spear he inflicts on *Amfortas* a painful wound, which henceforth forever exposes him to the most woful torments.

These events, which precede the drama proper, are made known to the audience in an epic or episodic form during the first act, which also contains some of the most stirring dramatic incidents in the play. When the curtain is drawn, *Gurnemanz*, a robust and hale old knight, and two young pages are seen asleep under a tree. *Gurnemanz* awakes at the sounds of invisible trombones blowing a morning call in the direction of the Grailsburg. He rouses his companions, and bids them go to the lake and prepare the wounded King's morning bath. As they retire toward the lake, which is seen in the background, they suddenly behold a horse, with a female rider, dashing wildly along, almost flying. It is *Kundry*, who in hours of freedom always endeavors to atone by some good service for the harm she does the knights while under the influence of *Klingsor's* spell. She is arrayed in a short dress, held together by a girdle of snakeskins; her black hair flows in disorder over her shoulders; her complexion is dark brown, and her eyes piercingly black, now wild in expression and anon fixed in a dead stare. In her hand she has a small flask, which she gives to *Gurnemanz*, and then throws herself on the ground, exhausted.

The King's approach is now heard. He is conveyed in a litter, accompanied by knights and esquires. From *Gurnemanz* he receives the flask, and hears that *Kundry* has brought it as balm for his wound from Arabia. He expresses his gratitude, but has no hope in the remedy, for he knows he can only expect a cure through one whom the grail has announced to him as his saviour. "By pity enlightened, a guileless fool; Wait for him, my chosen tool"—these were the words that once appeared in magic letters on the rim of the holy vessel while he lay before it in fervent prayer. The procession now moves on toward the lake, while the esquires remain taunting the mysterious *Kundry*, when suddenly the whiz of an arrow, imitated in a strikingly realistic manner by the orchestra, followed by weird, swan-motive harmonies from "Lohengrin," is heard. A wounded swan slowly flies across the lake, and then falls down dying. The *Parsifal* motive announces the appearance of the culprit who has thus ruthlessly killed one of the animals sacred in these precincts. In an affecting passage, in which words and music are alike beautiful, *Gurnemanz* reproaches *Parsifal*, who at first boasts of his skill in having killed the bird "on the wing," but, after listening to the old knight, follows a sudden impulse and breaks his bow in pieces. The question who he is and where from he professes to be unable to answer, when *Kundry* interrupts the dialogue and announces that he is the son of *Gamuret*, who gave birth to him after the death of his father, who fell in battle. To save her son from a similar fate she reared him in a deep forest, ignorant of the world and his parentage.

Parsifal now remembers that one day he saw some armed horsemen, with beautiful horses, whom he endeavored to follow. Soon he lost sight of them, and, with self-constructed weapons, fought his way through the various dangers that beset him. *Kundry* replies that his mother is dead—that his departure broke her heart; whereupon *Parsifal* is seized by such sudden regret and horror that he threatens violence to the unhappy messenger of these tidings; but *Gurnemanz* protects her from his fury. A sudden trembling and fatigue now overcome *Kundry*, who retires into the forest to sleep. The magic motive of *Klingsor* in the orchestra explains that it is his spell which calls her thus to his castle. *Gurnemanz* suspects that *Parsifal* may be the "guileless fool" who is chosen to relieve the King, and accordingly invites him to follow him to the Grailsburg. As they seem to walk from left to right, the scene gradually changes; the forest disappears, and wild rock takes its place; a door opens amidst walls of stone, which they enter. Sounds of bells and trombones are heard coming nearer and nearer. At last they arrive in a large hall, ending above in a vaulted dome, through which alone light is admitted. A door opens on each side, through one of which the Knights of the Grail enter in procession, singing a solemn chorus. While they take places at two long tables their voices are joined by those of youths in the mid-height of the dome, and boys' voices at the summit. Through the opposite door another procession enters bearing *Amfortas* in his litter. It is the King's duty to uncover the grail, to rejuvenate his knights; but he longs to be relieved of this duty, as it gives him, too, renewed vitality and prolongs the agony of his existence. The voice of *Titurel*, however, urges him on, and he at last uncovers the grail. Darkness has meanwhile spread over the hall so that the grail is distinctly seen gradually glowing with a purple lustre. *Amfortas* raises it and gently swings it about on all sides—the whole act being accompanied by music of the most super-terrestrial, ethereal character, like a halo of sound. *Gurnemanz* invites *Parsifal* to take part in the supper, but *Parsifal* remains standing lost in mute astonishment at these proceedings. After the knights have again departed, the disappointed *Gurnemanz* shakes *Parsifal* by the arm and bids him depart:

> "Leave thou our swans in future alone,
> And seek thyself, gander, a goose."

The first is by far the longest of the three acts; its duration being over an hour and a half, while the others are somewhat over an hour each. It contains situations as fine as any Wagner has ever conceived, the most affecting scene being the uncovering of the grail, followed by the triple chorus of knights, youths, and boys at different altitudes above the stage—the effect of which can be approximately judged of from the wonderful beauty of the trio of Rhine daughters from an elevated position, as heard at the late musical festival in New York. The idea is similar to that which Wagner, early in his career, used in his cantata "Das Liebesmahl der Apostel"; and as thus transplanted it is eminently dramatic—that is, in harmony with the character of the situation. The gradual glowing of the grail is effected by means of a current of electricity with which it is supplied by means of a thin wire. The effect is exceedingly impressive. The flight of the swan, like that of the spear which remains suspended over *Parsifal's* head in the second act, and of the dove which hovers over him at the close of the third, is also managed in a clever and thoroughly artistic manner.

The contents of the second and third acts may be summed up in fewer words. After an agitated introduction by the orchestra the spectator finds himself transferred to *Klingsor's* magic castle—at first in the inside of a tower open at its top. Magic implements are scattered about everywhere. *Klingsor* summons *Kundry* by lighting a bluish flame in the background of the stage. When *Kundry* appears he commands her, in spite of her pitiful protests, to use her beauty and persuasiveness to ruin *Parsifal*, who is already seen by him approaching the castle. He calls out to the knights to defend themselves, but *Parsifal* soon puts them all to flight. The tower now slowly sinks out of sight, and its place is taken by a magic garden full of tropical vegetation and the most luxuriant large flowers. A number of beautiful damsels in light attire rush on the stage and bewail the loss of their playmates until they behold *Parsifal*. While some flirt about him, others disappear in an arbor, whence they soon return arrayed in flowers, looking like living flowers themselves. *Parsifal* regards the spectacle unmoved and unyielding, when presently *Kundry's* voice is heard calling out his name, "*Parsifal*, remain!" The flower-girls reluctantly retire, not without a parting fling at the "guileless fool," who is now at the mercy of *Kundry's* charms. With true feminine art she wins his confidence by telling of the last moments of his mother. *Parsifal*, overcome with grief, sinks down at her feet, when she raises his head and gives him his mother's last greeting and the first long kiss of love. With an expression of consternation *Parsifal* jumps to his feet, and pushes *Kundry* away. Her kiss, like a sudden pang, gives him a presentiment of *Amfortas's* sufferings, and at once the whole situation dawns on him. Hitherto he has only been the "guileless fool"; now he is also, "through pity, enlightened." *Kundry* refuses to listen to his explanation that to grant her his love would condemn her to a new lease of her cursed existence. She invokes a curse on him—a curse which shall compel him to go about the world searching in vain for *King Amfortas*. Her cries summon *Klingsor* to the castle wall, whence he hurls *Amfortas's* holy spear at him. The spear remains suspended over the head of *Parsifal*, who seizes it and describes the shape of a cross. Instantaneously, as through an earthquake, the castle vanishes, the garden is transformed into a desert, and the maidens lie as withered flowers on the ground. The suddenness of this transformation is one of the greatest of modern scenic marvels, and, like some of the other effects, it shows that the machinist, Fritz Brandt, is determined to emulate the fame of his father, Carl Brandt, who constructed the Nibelung machinery, and planned some of the contrivances to be used in "Parsifal" before death took him away, about a year ago.

The third act contains so few incidents that it will be pronounced undramatic by those who hold that the essence of the drama consists in rapid and varied action. But in a higher sense

of the word—that in which "Tristan and Isolde" is Wagner's most dramatic work—the third act of "Parsifal" is also highly dramatic, for in it the development and conflict of emotions are intensely and vividly portrayed. At the beginning of the third act, after a weird and sad introduction of great beauty, we see a smiling meadow at the borders of a forest; in the background, a simple hermit's hut. It belongs to *Gurnemanz*, who now appears as a very old man. Strange, mournful sounds, proceeding from behind a bush, induce him to search for their cause. It is *Kundry*, now again the simple, homely servant of the grail, and no longer the fascinating queen of *Klingsor's* flower garden. She is disinclined to speak, but goes into the hut to work. Looking about him, *Gurnemanz* espies a knight in full armor approaching. He bids him respect the laws of this holy place, which forbid any one on Good Friday to bear arms. *Parsifal* complies, and *Gurnemanz* now recognizes him, as well as the holy spear, at sight of which he breaks forth in joyous exclamations, heralding the King's release from his torments—for only then can his wounds be closed when they are touched by the "guileless fool" with the same spear that inflicted them. *Gurnemanz* relates how, since *Parsifal's* departure, the knights have been deprived of the blessing of the grail, since the King refuses to uncover it—hoping thus to starve out his life even as *Titurel's* came to an end after long privation. Once more on this day, however, the grail is to be uncovered. The scene changes back to that which closes the first act, in the Grailsburg. Two processions of knights again appear, one with *Amfortas* on his litter, the other with *Titurel's* bier, accompanied by the strains of a majestic funeral march. *Amfortas* refuses to perform his task—to be once more brought back to painful life from the brink of death. He tears open his bandages and begs his companions to kill him, when *Parsifal* appears and touches the wounds with his spear. He then takes the grail in his hand while a halo of light is shed over all. A dove descends and hovers over the head of the new King, *Parsifal*. *Kundry* sinks slowly to the ground, lifeless, while *Amfortas* and *Gurnemanz* do homage on their knees to *Parsifal*. It is a magnificent final tableau.

As time is short and art-criticism at Bayreuth long, I must defer some general æsthetic remarks on the poem, and the music, and the relations of "Parsifal" to Wagner's other dramas, until after the second or third performance. The reception of the new drama last evening was very enthusiastic. After the first act there was prolonged applause for Wagner, the spectators all facing round toward his box, as it was understood that the artists had agreed not to appear before the curtain so as not to interrupt the illusion. After the second act the applause was so demonstrative that Wagner was obliged to come forward and explain that the refusal to appear before the curtain was not stubbornness on any one's part, but a desire that the artists should only be seen within the frame of the art work. This was interpreted by the audience as a desire on his part that there should be no applause, and accordingly the third act, the grandest of all, was received in silence—a curious illustration of the absolute subjection of the Wagnerites to their master's command. But Wagner again came forward to explain that he had been misunderstood; at the end of the performance he was the first to applaud the artists for their admirable work. A perfect tornado of applause and calls of "Artists," and "Bravo" now burst out; but the artists were already busy with their wardrobe and could not appear. This was a pity, for they deserved the most unqualified approval of the audience. The cast, down to the smallest details, was as perfect as it can only be at Bayreuth. To prove this I need only state that the parts of *Kundry*, *Gurnemanz*, *Parsifal* and *Amfortas* were taken respectively by Frau Materna and Herr Scaria, of Vienna, Herr Winkelmann, of Hamburg, and Herr Reichmann, of Munich. The choruses of knights, youths, and boys were beautifully sung, as well as the flower-girls' chorus, which was very effective and stirring. All the vocalists pronounced their words with a distinctness which if emulated elsewhere would soon make obsolete the reading of text-books during a performance; and most wonderful of all was the perfect accordance in time and tune between the various musical factors, invisible to one another—the orchestra, the choruses, the vocalists, and the brass-band and bells on the stage. To those who had not been at Bayreuth before, last night's performance must have been a revelation.

BISMARCK AFTER THE CRIMEAN WAR.—II.

BERLIN, July 12.

AFTER having shown that a most intimate alliance between France and Russia will be a natural result of the Paris peace, Bismarck discusses the chances of other possible alliances among the great European Powers.

"Austria," he continues, "will have to share the dangers created for Europe by the connection between Russia and France, and must avert them by timely sacrifices, by either making concessions in Italy for advantages to be obtained in Germany, or else strengthening herself against attacks by treaties with other Powers. I believe that she will choose the first alternative, and that she will try to gain Russia's confidence by a personal change of her Ministry. Austria will only in case of the utmost necessity avail herself of our or of English support. If she should endeavor to make us guarantee her foreign possessions by new treaties, I do not believe she would use such a treaty for any other purpose than to parade it on the diplomatic field to her advantage and to our injury. Even supposing that arrogance and hatred should allow the Vienna Cabinet to ask for English assistance, or to have the hereditary imperial provinces protected by Prussia, Austria is, on the other hand—even if strengthened by an alliance with us and with England—too cautious to engage in a serious struggle against France and Russia, if it can be avoided *per fas et nefas*. She will consider the party of the Teutonic nations (*Germanen*) too weak for her to join, and in my opinion she will be right in this respect.

"If it could be expected that in such a war Prussia, Austria, the German Confederation, and England would coöperate sincerely, intimately, and confidently with their full power, it would be cowardice to doubt a victory. But that is not the actual situation of affairs. Suppose that England should resolutely stick to us, and that in spite of the French, Russian, and perhaps the American, Danish, and even Dutch fleets, she should succeed in keeping off an invasion, in victoriously maintaining herself on the sea, and in protecting the German shores and in occasionally harassing the French coasts with 10,000 to 20,000 men. Such an energetic way of acting would surpass my expectations, but nevertheless the Continental war against the armies of Russia and France would chiefly rest on the shoulders of Germany. The four last army corps of the German Confederation have not the military efficiency of those of a great Power, and how many of them would fight on our side would only be proved by success. Supported by an alliance of Russia, Austria, and Prussia, the Confederation would fairly hold together so long as it believed in the final victory of those Powers, be it with or without the participation of the Middle States. In such a doubtful case, however, as a war against East and West the princes *au fur et à mesure* would secure themselves by neutrality treaties if they did not oppose us in the field."

"In any real danger, as in face of a French, Russian, and Austrian alliance, the old Federal treaties will not hold out. Last year I was told over and over again by the leading ministers of Bavaria, Würtemberg, Baden, Darmstadt, and Nassau, that they considered it their honest duty to give up the Confederation if the interest of their respective countries, or the personal security of their respective princes, would be endangered by their sticking to the said Confederation. . . . Backed by a million soldiers of the Holy Alliance, it may appear pretty durable. As matters stand now, I am fully convinced that a real danger from without does not exist. There is no need either of enlightening the foreign Powers by the pilgrimages of the Beusts, Pfordtens, Dalwigks, and other small fry to Paris, nor does it require an extraordinary seduction to draw the rats out of the house when it is threatening to fall down. The foreign ministers here listen with a sarcastic politeness when we occasionally speak of a Confederate war in grand style. The seriousness of the Roman augurs of the old school is necessary to the Diet in order to revive thoroughly the military constitution of the Confederacy.

"It would not have been different if the Holy Alliance had gone to pieces sooner, but we owe it to the Austrian policy of the last two years, which reached its culminating point in the treaty of December and in the note of January 14, that the inner rottenness of the Confederacy has become so apparent and generally known at home and abroad. The Confederation could hold itself free from any of the wars of the two great Powers without breaking its constitution, if one-third of its votes (such as Frankfort, Nassau, Luxemburg, Hesse-Darmstadt, Baden, Würtemberg, and Bavaria) refused consent to the declaration of war. They, however, do not dare so to do; they rather vote and leave us in the cold. Shall we be able to defend ourselves in alliance with Austria against East and West, if Sardinia, probably the Belgian army, and a part of the German Confederation be united with the latter? If everything were as it ought to be, I would not despair; but the Emperor Francis Joseph is not in the same degree master of his provinces and of his subjects as our King. Austria on the offensive is an enemy not to be trifled with. She can employ more than 200,000 good soldiers beyond her boundaries, and besides keep enough of them at home to watch over her Italians, Magyars, and Slavs. On the defensive, however, and attacked within her own boundaries from East and West, the present Austria seems to me to be rather weak, as at the first successful shock of the invader the whole artificial structure of Bach's and Buol's regiment of clerks (*Schreiberregiment*) will tumble down like a house of cards."

"Besides this danger I see a still greater one in the fact that even in the greatest common peril a Prussian and Austrian alliance would be just the reverse of what a sincere alliance ought to be. Mutual political distrust, political and military suspicion on the part of the one lest the other might, by special treaties with the enemy, prevent the aggrandizement of the other when successful, but secure its own salvation when unsuccessful—all these considerations would in this case be even stronger and more paralyzing than in any ill-arranged alliance of the past. The generals would grudge a victory to each other until it would be too late. In our own history we have the records of the treaties of Vossem and St. Germain, the recollection of our defeat at the Vienna Congress, which justify us in distrusting the results of an Austrian coalition; and the politics of the last two years proves that Macchiavellian practices have not been discarded. Austria would perhaps propose to give us guarantees by a change of her responsible men after Buol had lost credit and confidence with all cabinets; but the traditional policy of Austria toward us would not be set aside by such a policy, and I would trust the old fox in a new pelt as little as the old one when shedding his summer hair. According to Vienna politics, Germany is too small for both of us. As long as we have not arrived at and executed a fair settlement as to the influence of each of us in Germany, so long we shall both plough the same acre and so long will Austria remain the only state by which we can suffer lasting losses, and from which we can gain lasting advantages."

"By the Concordat and its consequences this historical and necessary friction has recently been increased, and the understanding has been aggravated. We have, however, besides these difficulties, a large number of conflicting interests, which neither of us can give up without resigning the mission in which each of us believes, and these cannot be disentangled by diplomatic and peaceful correspondence. Even the heaviest pressure from without, the most urgent danger threatening the existence of both of us, could not, either in 1813 or in 1849, forge the iron. The German dualism for a thousand years occasionally, and since Charles V. in every century, has regulated its relations by a thorough internal

war, and in this century also no other means than war can set the clock of its development at the right hour. By thus reasoning I do not propose to arrive at the conclusion that under the most favorable circumstances we should direct our policy toward effecting the decision between Austria and ourselves. I only wish to express my conviction that in not too long a time we shall have to fight for our own existence against Austria, and that it is not in our power to prevent such a war, because the march of events in Germany offers no other outlet."

"If this, my opinion, be correct, which of course is more a question of personal belief than of proof, it will be impossible for Prussia to carry her self-abnegation so far as to jeopardize her own existence in order to protect the integrity of Austria, and that in a conflict which in my eyes will be hopeless. Among the many difficulties with which our side would be saddled in such a struggle, I have not mentioned those which lie in the peculiar state of English affairs. Since the Reform Bill the hereditary wisdom of former days has not been able to clear the passions of an inordinate party feeling and partisanship. It is impossible for me to gain confidence where a newspaper article is of more importance than the considerations of a statesman. On account of her insular security it is very easy for England to support or drop a Continental ally according to her wants, and a change in the Ministry is sufficient for effecting and justifying a *revirement*, as Prussia experienced in the Seven Years' War. The mutual aversion and the commensurate arrogance of Austria and England, and the political and religious contrast between them, will in many ways loosen and cripple an alliance of the two; and if we really remain victorious against a Franco-Russian alliance, what have we, after all, fought for? For the preservation of the Austrian preponderance in Germany, and the miserable constitution of the Confederation. For such ends we cannot possibly stake the last remnant of our strength and jeopardize our existence. If, however, in company with Austria, we should try to carry out changes in our favor, we should fare as in 1815. At the right moment Austria would conclude new treaties of Ried and Fulda, and, in the long run, by treaties with the enemy, place herself in a favorable position to mete out to us, as at that time, the price of our victories.* As formerly, she avails herself of every means to prevent Prussia from arriving at a higher position in Germany, and to keep us in our awkward geographical boundaries, and under the unfavorable constitution of the Confederacy.

"In delineating what may appear to you eventualities and phantasms which may never be realized, I only justify my assertion that Austria will not even accept the chances of a German-Prussian-English alliance against Russia and France, apprehending that they are too weak and uncertain. If, therefore, it be true that Austria has already urged at Munich treaties for the guarantee of her Italian possessions, and that she intends similar steps in Berlin, that Count Buol has already visited Hanover and Dresden for the same purpose, I do not believe that these plans are prompted by the idea of collecting Germany under her flag, and of braving a world in arms. The Vienna Cabinet, on the contrary, intends to make diplomatic use of our or the other Governments' assurances in order to secure for herself better conditions at our expense for an understanding with Russia, and, if possible, with France. She will play *Don Giovanni*, at all courts, if she can misuse as robust a *Leporello* as Prussia; and in keeping with this rôle she will always be ready to draw herself out of the scrape and to leave us in it. If peace continues, she will thank us for our friendly feelings toward the solidarity of German interests by trying to draw the Zollverein out of our hands [as she did in 1862]; if war breaks out, she will, in spite of all the treaties in her pockets, not be prevented from obtruding with as much dexterity as safety on that side which offers her the best prospects of supremacy in Germany, which, in consequence of her centralizing German tendencies, is at present more necessary to her than ever before.

"I cannot believe that we or Bavaria should lend ourselves to such a one-sided business at a moment when the situation is not yet clear, when no danger appears, and no new political group is yet formed. By binding ourselves to Austria we should only tie ourselves to an incalculable and malevolent passenger on our voyage into the unknown sea of the future. In the year 1851, especially at its beginning, the danger of the revolution spreading beyond the limits of France and Italy was much nearer, and the monarchical Governments had a joint interest, as against this danger, which quite naturally created our treaty of May. A similar situation would recur after the French Empire had been overthrown. As long as it stands, however, the repulse of democrats is out of the question, and the cabinets have only to agree on a common policy, in which our and the Austrian interests do not coincide A treaty like that proposed by Austria for the protection of her Italian provinces would only prematurely provoke France, and cause a cooling of Russia toward us. Such consequences would be in the interest of Austria, and she would take care that the fact did not remain unknown in Petersburg and Paris; and, besides that, the culpability of the indiscretion would be thrown on our shoulders. However, in all and everything that Austria would like and be able to do without us, she would not feel herself confounded by the best Prussian or German treaties of guarantee. She used the treaty of April 20, 1854 [neutral guarantee of Austria and Prussia of the former's non-German provinces], for no other purpose than to make it sparkle in her own interest, to treat us badly, and to carry on a policy as double-tongued as unwise. On the other hand, our guarantee did not prevent her clandestinely entering into the treaty of December following, and acting with others as her interest dictated. If the calculations of Count Buol had not been defeated by the death of the Czar Nicholas and the unexpected yielding of the Emperor Alexander, we should not have become acquainted with Austria's thanks otherwise than by her secret opposition to our admission to the conferences.

"In my opinion, our situation, being that of a desired ally, is a very favorable one, as long as the new political groups are not too sharply delineated, as long as their activity remains diplomatic, and as long as a good understanding with one does not involve a rupture with the other. If, however, a Franco-Russian alliance with warlike purposes should be realized, we could and should not be among its adversaries, because we should very likely also succumb, or perhaps triumphantly bleed to death—*pour les beaux yeux de l'Autriche et de la Diète*. To keep open every chance, nothing seems to me at present required but a little more inexpensive friendship toward Louis Napoleon, and the refusal of each attempt to bind us, *gratuitement* and beforehand, to the heels of another power."

So far Bismarck. Three years later the Italian war was brought about by Louis Napoleon against Austria. The Prince of Prussia, then regent of the kingdom, went so far in contradiction to his future Chancellor's views as to intervene in Austria's behalf. Several Prussian army corps were under marching orders; but the Emperor of Austria concluded the sudden peace of Villafranca, preferring to sacrifice his best Italian provinces rather than that the Prince of Prussia should be chief commander of the united German-Austrian forces. Rather an ignominious defeat than an energetic war, the possible victories of which he would have had to share with the hated German rival! Seven years later the inborn animosity led to a new outbreak of hostilities, but this time King and Chancellor were guided by the same aspirations and tendencies. Königgrätz settled the old dispute of supremacy. Austria was put out of the Confederation, which was dissolved forever by Bismarck. The new German Empire rose from the ashes of a detested and contemptible political nondescript. Germany is herself again, Austria, too, is better off, and both countries live side by side in a state of friendship which, in the absence of colliding interests, is growing more intimate from day to day.

† † †

* It was in October, 1813 (not in 1815), that the Austrian Government concluded special treaties with Bavaria, Würtemberg, and Baden, at Ried and Fulda, by which these kingdoms and grand duchy of Napoleon's grace obtained full indemnity for the past and the acknowledgment of their sovereignty and territorial extent, so that, as the peers of the great Powers, they made war against Napoleon. The Prussian patriot Stein wanted to have the petty kings of the above-named countries outlawed. Glorious old Blücher, when asked how he would like to have them dealt with, answered, "I prefer them cold." Metternich, however, carried his plans, and, to the detriment of Prussia, gained strong supporters for his future federal policy.

Correspondence.

MR. HAMERTON ON TRUTH TO NATURE.

TO THE EDITOR OF THE NATION:

SIR: It is not generally worth while to take notice of misrepresentations in reviews, but as the reviewer of 'The Graphic Arts' in the *Nation* has touched upon a doctrine of mine which I consider of especial importance, perhaps you will kindly allow me space to state what the doctrine really is. It refers to truth in art. Your reviewer says of me:

"In an early part of the book Mr. Hamerton reiterates the doctrine, which he has for some time held and taught—enunciating it most distinctly and fully in his 'Life of Turner'—that the business of an artist is to give æsthetic pleasure without necessary regard for truth to nature. He teaches that an artist may utterly violate all laws of truth with impunity. We hold this to be a very mistaken view of the matter. We agree with the proposition that it is an artist's business to give æsthetic pleasure; and we go so far, also, as to hold that if he does not give æsthetic pleasure, a man is not entitled to rank as an artist at all. But we entirely dissent from the doctrine that any æsthetic pleasure which does violence to nature can be worthy pleasure, or that any form of representative art which is not truthful can be good art. The limitations, or conventions, to which all art is more or less subject, are by no means of the nature of untruths. Against the idea that art should concern itself simply with physical facts, Mr. Hamerton has very justly contended; but we think he has been led too far, and that his present doctrine is calculated to cut the arts adrift from their proper moorings quite as effectually as ever the narrowest pre-Raphaelite doctrines did."

No doubt your contributor quite expresses the popular sentiment as his own, and it would only be natural if the great majority of your readers sided with him against me; but I should at least desire that they might be made acquainted with the real nature of my doctrine on this subject.

Careful observation of what has been actually done in the fine arts by the most famous men has fully convinced me that the exact delineation of nature and the exact imitation of natural color have not been the ultimate goal to which their different orders of genius have tended. We must remember always that severely truthful naturalism in art would be something very nearly resembling accurately-colored photography (not *quite* resembling it, for reasons which every reader acquainted with these matters will know). It would be like a camera-obscura image with inferior light. But, in fact, what do we see in the works of celebrated artists? We see, in the first place, that their paintings do not resemble the colored image in the camera obscura (which is the natural picture), and we see, again, *that the paintings of different men do not resemble each other*. On further and more minute investigation, we discover that these differences are occasioned by divergences from the positive truth; and when once we understand what the positive truth really is, and what a rigid, unaccommodating thing it is, we soon become able to measure the divergencies occasioned by individual preferences and feelings. Perfectly accurate art would be entirely devoid of passion: the expression of passion in art (which is highly desirable) *is always obtained by some kind of accent or emphasis which destroys the balance of the real truth*. An absolutely truthful painter would be keenly observant, yet without passion; and he would probably be most uninteresting. Now, with reference to the degree of liberty enjoyed by the artist: can he violate all natural truth with impunity? The answer to this question is, that an artist misses his purpose when he attracts attention to questions of truth

at all, because discussions about truth are f ata to the perfect enjoyment of his work, which is the delight in its beauty or the sense of its impressiveness.

Now, my theory is, that the real object of an artist, so far as truth is concerned, should be to escape discussions about it; but to escape these, I think it is obvious that there must be a considerable amount of truth in his work, and a very great amount of knowledge in his own mind. To give an example, I may say that an artist who made a drawing for me omitted the mouth in one of his faces. I said that omissions were often very permissible, and even necessary, in art; but that, as all human beings I had seen possessed mouths, it seemed desirable that the feature should not be omitted in the drawing. The reason for my criticism was not the falsity of a face without a mouth, but that the peculiarity attracted attention. There were other less obvious omissions in the same design that I did not complain of. Here, then, was a case (of a very elementary nature) in which a truth was essential, and thousands of other truths are essential in the same way, so that there is a vast amount of essential truth in art simply because the artist cannot afford to attract attention by its absence. And now let me pass to the introduction of falsities. Here is an example: I was in the studio of a very famous English artist, when he showed me a picture in progress. "I have been obliged, as you see," he said, "to put the architecture in my background in false perspective, because the true perspective looked wrong." I could only say that he acted wisely, and that a great master in similar circumstances would have done the same. A landscape-painter will sometimes introduce a false light—I mean a light which, under similar conditions, would not be possible in nature—and he will do it with clear knowledge that it is not natural, yet it may *look* more natural than the light calculated at its true angle. Things are often put in proportions which are intentionally false: the small size of the fishing-boats in Raphael's "Calling of Peter" is a well-known example. To be of any use as fishing-boats, they required to be at least three times that size; but, then, what would have become of the composition? It would have been a study of boats. The discrepancy between the boats and their work is of very little consequence, as few remark it, and those who do at once understand the reason for it.

In color, as in light and shade, arrangements are very frequently made for artistic reasons when they have very little reference to nature; and the higher the rank of the colorist, the stronger the color-faculty in him, the more will he be tempted to the employment of a kind of color which is to nature what the poems of Tennyson or Rossetti are to every-day conversation. Of course the work of a colorist has some foundation in nature: it is suggested by natural color, but it is really the product of human genius. Even when colorists suppose that they imitate nature (as by a facile illusion they sometimes do), they will tell you frankly that much of natural coloring is unsuitable for the purposes of art. One very good colorist told me that all the cold coloring of nature was unavailable except occasionally for contrast, yet there is a great deal of cold coloring in nature.

Your reviewer seems to be apprehensive that if my doctrines were generally admitted, they would be dangerous to art. Let me at once reassure him on this point. A candid and complete statement of the true state of the case can surely do no harm to art, while it may be of great benefit to criticism. It cannot be injurious to art, because, if the artist is not to draw attention to questions about truth at all, he must certainly have a great knowledge of truth. I have always maintained the necessity for knowledge, and always frankly expressed admiration for the knowledge displayed by great artists whose deviations from truth are frequent. Consequently, my teaching cannot have the effect of relaxing the industry of students. With regard to criticism, the effect of it can but be beneficial. What I dislike most in the common criticism of the day is its unfair application of the truth-test. Contemporary artists, especially when they are young, are often rudely condemned for deviations from truth which are as nothing in comparison with the far bolder deviations of great masters. If Mr. Briton Rivière were to draw lions as little like natural lions as those of Rubens, he would be treated with contemptuous severity; yet it has been the fashion among critics to extol Rubens as an animal-painter. "One of the greatest powers," says Kugler, "wielded by this almost universal genius is that of animal-painting. Horses, dogs, stags, wild boars, and especially ravenous animals, such as lions, tigers, panthers, wolves, and foxes, he renders alike with inconceivable mastery." No doubt Rubens *could* have painted lions truthfully if he had taken the trouble to study them; but, in fact, he only painted them with sufficient truth to satisfy the criticism of his own time; and so his animal-painting fulfilled the necessary condition of not attracting attention to truth, but it is quite unjust to modern artists to extol his work as if it were absolutely true. The same may be said of Rubens as a landscape-painter: he gave truth enough for his time, but he did not give absolute truth, or anything approaching to it.

If my doctrines were so dangerous as your reviewer imagines, I should not be so much encouraged in my work by the approval of artists. It is well known that, as a general rule, artists dislike writers on art, the reason being that writers on art so often positively prefer to remain ignorant of technical matters, whereas artists rightly consider that sound and thorough technical knowledge is the very foundation of art criticism. It has been said of me that I am the only writer on art whom artists read. This, of course, is an exaggeration; but it is quite true that I am supported by the opinion of artists to a remarkable degree. When I offered myself as a candidate for the Watson-Gordon professorship in the University of Edinburgh, my candidature was supported in very strong and decided terms by twelve Royal Academicians, including the President, besides several associates, and by ten Scottish Academicians. It was also supported by several foreign artists of eminence, who had some acquaintance with my work; and it has often happened to me to receive hearty encouragement from artists outside the Academy. This is very easily explained. Men whose lives have been devoted to these studies are naturally gratified to see that there is at least one writer on art who will take the trouble to ascertain the true nature of the difficulties against which artists have to contend—a writer who does not expect incompatible qualities; a writer who has himself studied nature as well as art, and who knows in what they differ. It has been my special work to demonstrate the importance of technical conditions in the expression of mental qualities; to show the inexorable nature of these conditions, and their enormous influence on performance—an influence comparable to that of the chosen instrument in music. The same musician may play on the violin, the piano, and the drum, but he can never make the violin give the harmonies of the piano, nor obtain from the piano the sustained notes of the violin, nor from the drum its range. No power of genius can get over the limits of the instrument. So it is in the graphic arts. They are, it is true, nothing more than instruments for the expression of that artistic genius which lies behind all of them; but the genius itself is affected as it passes through them. Some part of it may be kept back. The Titian of the pen-drawings is not the Titian of the paintings, but only a part of him. The Dürer of the woodcuts is not the Dürer of the intaglio engravings, but only a part of him. I certainly do not undervalue that general art-faculty which lies behind these instruments, and uses them as means, but I say that if you try to estimate artists without being at the pains to learn what are the conditions—the material conditions—of their work, you are little likely to do justice either to their artistic abilities or to such critical faculty as you may yourself possess.

Sincerely yours, P. G. Hamerton.

Autun, July 18, 1882.

[We agree with Mr. Hamerton that "the exact delineation of nature and the exact imitation of natural color" have never been, and can never be, the object of a great painter. Mr. Hamerton seems to us to write confusedly, and to criticise erroneously, owing to his limitation of the term "truth to nature." There is a higher and a lower truth to nature. Mrs. Jarley's wax-works exhibit the lower, Michael Angelo's "Fates" the higher. The higher truth to nature is truth, not to her appearance to the outward eye, but truth to her aspect to the eye of the imagination—truth to her essential meaning as interpreted by the poetic spirit in the soul of man. "The vision and the faculty divine" see and represent the higher truth; not the literal, visual fact, but that literal and visual fact according to the terms of art. In each art these terms differ. No man ever speaks in verse continuously in real life, but the characters of Shakspere are true to nature in doing so. But this truth to the imaginative vision and inward passion of the artist rests indissolubly in the exact, minute, and absolute knowledge of the truths of external nature. Our doctrine is as old as Aristotle, and we regret that Mr. Hamerton should mistake our meaning, and much more that he should use his justly-acquired influence in diffusing what we believe to be confused and mistaken teaching.—Ed. Nation.]

Notes.

James R. Osgood & Co.'s fall announcements include 'Jewish History and Home-Life in the Bible,' by Henrietta Lee Palmer; 'Bible Narrative,' in three volumes; Cruden's 'Concordance,' enlarged by the Rev. J. B. R. Walker; 'The Historical, Political, and Diplomatic Works of Niccolò Machiavelli,' translated by C. E. Detmold, in four volumes octavo; 'The Correspondence of Thomas Carlyle and Ralph Waldo Emerson, 1834–1872,' edited by Prof. C. E. Norton, in two volumes; 'The Life and Letters of Francis Lieber,' edited by Thomas Sergeant Perry; 'The Life of Dr. William Rimmer,' the sculptor, by T. H. Bartlett, with numerous illustrations from his works in statuary, painting, and drawing; 'Memoirs of John A. Dahlgren,' by his widow; 'Charles Albert Fechter,' by Kate Field, in the American Actor Series; 'The Works of James Abram Garfield,' edited by President Hinsdale; Lieut. Danenhower's 'Narrative of the *Jeannette*'; 'The Old Masters of Belgium and Holland,' by Mrs. Mary C. Robbins, illustrated; 'Parisian Art and Artists,' by Henry Bacon, illustrated; a translation of Gonse's 'Eugène Fromentin'; Howells's latest serial, 'A Modern

Instance'; a posthumous tale by Nathaniel Hawthorne, only recently discovered, 'Doctor Grimshawe's Secret'; Poole and Fletcher's 'Index to Periodical Literature' (in December); 'Poems,' by Margaret E. Sangster, and 'Poems of Love and Nature,' by Mary Clemmer; 'Old Love Letters, or Letters of Sentiment,' written by persons eminent in English literature and history, and edited by Mrs. Abby Sage Richardson; 'Short Sayings of Famous Men,' with historical and explanatory notes, by S. Arthur Bent; 'Nantucket Scraps,' by Mrs. Jane G. Austin; 'Spiritual Creation,' by Henry James; 'Chimes and Rhymes for Holiday Times,' edited by Almira L. Hayward; 'Heavy Ordnance, Siege and Naval Guns, Light Artillery,' as invented and improved in the United States, edited by Gen. C. B. Norton; and a quite new edition of Scott's 'Lady of the Lake,' with 120 special illustrations by American artists, the scenes of the poem having been freshly sketched upon the spot by Mr. A. V. S. Anthony. The same house will also publish by subscription 'A Memorial History of the County of Hartford, Conn., its Towns and Cities, 1631–1881,' edited by Dr. J. Hammond Trumbull; and Bishop Perry's 'Centennial History of the American Episcopal Church.'

J. B. Lippincott & Co. have in press 'A Landlubber's Log of his Voyage around Cape Horn,' being a journal kept during a four-months' voyage on an American merchantman, bound from Philadelphia to San Francisco, by Morton McMichael, 3d.

Macmillan & Co. have in press a cheap but not inelegant American edition of Butcher and Lang's translation of the 'Odyssey,' which appeared two years ago in England.

The "Clarendon Press Series" (Macmillan) has added to its list of classical text-books the 'Helena' of Euripides, edited by Mr. C. S. Jerram. When Mr. Jerram's edition of the 'Tabula Cebetis' was published in the same series we expressed a very favorable opinion of the ability and scholarsbip with which the work was executed. The present edition of the 'Helena' appears to be better adapted for the use of students in a class than any with which we are acquainted. We would, however, suggest one or two changes, either for a second edition or for future editions of other plays. Mr. Jerram had previously edited, for the same series, the 'Alcestis' of Euripides. He seems to take it for granted that all readers of his edition of the 'Helena' will have at hand his edition of the 'Alcestis,' an assumption by no means true in all cases. It would have been better to make the one more independent of the other, even at the risk of a little repetition. Again, Mr. Jerram has placed his explanatory and his critical notes in different parts of the volume, though it would have been conducive both to convenience and clearness to put all the notes on a given passage in one place.

G. P. Putnam's Sons have added to their 'Transatlantic Novels' a translation of Halévy's 'Abbé Constantine,' already noticed in these columns.

B. Westermann & Co. have received from Justus Perthes, Gotha, the much-needed map of the seat of war in the East, for lack of which the daily reports of operations have been very imperfectly intelligible. It consists of (*a*) a general map embracing Crete, Cyprus, Palestine, and Egypt as far south as Edfu; (*b*) a small side-map of what might be called "British interests," extending from the British Channel to Beaconsfield's "scientific" Indian frontier, and giving at one glance all southern Europe, all northern Africa, and all of Islam as far as Kandahar; and (*c*) another side-map, on a scale of 1: 1,500,000, showing the Nile delta in detail, and the Suez Canal, with Cairo and Suez for the southern limits. This chart has the well-known excellence of the Gotha work, and is well worth its moderate price.

After the success of M. Francisque Sarcey's series of critical and biographical sketches of contemporary actors and actresses, M. Jouaust was encouraged to start a similar series devoted to the artists, and written by M. Jules Claretie, under the title of 'Peintres et Sculpteurs' (Paris: Jouaust; New York: F. W. Christern), of which eight parts have now appeared. The work is divided into two sections: in the first, comprising the artists who died between 1870 and 1881, M. Claretie has considered Henri Regnault, Tassaërt, Hamon, Millet, and Corot; in the second, which includes only artists now living, he has noticed MM. Meissonier, Baudry, and Gérôme. Each essay has a portrait etched by L. Massard.

The plates of Part 7 of Reiss and Stübel's 'Necropolis of Ancon in Peru' (Dodd, Mead & Co.) present a great variety of specimens of Peruvian art, all admirable. The woven stuffs are, as usual, remarkable for their coloring, and for the ingenuity of their geometric and animal patterns. Especially noteworthy are the highly-decorative raised braids and rosettes of Plate 60, designated by the French term *passementerie*. Delicately made slings are shown to have been used also as fillets, in the handy fashion still to be witnessed in Bolivia. Another plate depicts sundry small domestic and toilet articles like spoons, spools, combs, dye-tubes, needles, brushes, and an elegant little workbag—a net for holding balls of cotton thread. The mummies of children yield very curious wooden dolls, one representing a child in its cradle, whose fez-like cap, anxious face, and clasped hands suggest Abdul-Hamid pondering England's requirements toward Arabi; and some quilted and clay toy figures of the llama. A few excellent pieces of earthenware conclude this instalment. Three more will finish the work.

Bulletin No. 62 (July) of the Boston Public Library contains the titles of a large number of books on Egypt, Assyria, etc., mostly purchased from the library of the late F. J. Chabas.

Our readers may remember that the Société Bibliographique Belge offered a prize for the best historical bibliography of Belgium. The results are said to have been very satisfactory. Two memoirs have received prizes, by M. Lahaye and M. Potter, and are both to be published. The Government gives 2,000 francs in aid of the publication.

—The late Mr. George P. Marsh's interest in everything relating to the forest lasted to the very end of his life. Four days before his death, on the 20th of July, he sent a long letter to the writer of this note describing his impressions of the forest school of Vallambrosa, where he died on the 24th.

"Even at this height, the deciduous trees," he wrote, "which in Milton's day strewed the rare brooks so thickly with their autumnal leaves, thrive luxuriantly, though the monks apparently planted few, if any, other than evergreen trees. It would be difficult to exaggerate the picturesqueness of the scenery here, or the beauty of the vast outlook over the Tuscan hills, but I have been disappointed at not seeing a single compatriot among the forest growths of these woods, although there is every reason to believe that most of our native trees might be advantageously propagated here. There is, very near the Old Monastery, a row of maples, stated to be less than thirty years from the seed, in which many of the trees have attained a diameter of fifteen inches—a rate of growth much greater than that of the sugar-maple in Vermont. I am told that in a part of the forest I have not yet seen there are many beeches above a metre in diameter. I have met with no instance of *Ueberwallung* [renewal of the bark on the cut surface of a tree] in these woods, though there are good specimens of this rare phenomenon in the museum of the Institute. . . I am more than ever impressed with the superiority of the artificial forest, both in quantity and quality, as compared with that of the natural and spontaneous growth. The fir woods here, though so thickly planted as to leave room for scarcely any lateral ramification, are of surprising rapidity as well as regularity of growth, and I think the famous ridge-pole of a barn in Waterbury, Vermont, which squares six inches with a length of sixty-five feet, might readily be matched here."

Mr. Marsh's knowledge of the literature of the forest and of forestry was unequalled even by that of the few specialists who devote themselves exclusively to the study of this subject. The influence which 'Man and Nature' has exerted in directing attention to the importance of a better understanding of the principles which underlie the theory of forest preservation, is hardly appreciated. It must long remain the best text-book for those who desire to understand the forest in its most important relations to man.

—The Public School System of the City of New York is the subject of a German lecture by Dr. Hartwig Gercke, a veteran pedagogue who for many years followed his vocation in this city ('Vortraege herausgegeben vom Deutschen Gesellig-Wissenschaftlichen Vereine von New York. No. 5'; New York: E. Steiger & Co., 1882). Dr. Gercke finds that during the last thirty years there has been much improvement in the public schools, and that some of their most glaring defects have been more or less remedied. His severest criticism is directed against the marking system, and against the excessive practice of examination, and especially of examination by others than those who do the teaching. On the former point, the majority of competent judges will probably agree with him; but on the latter there is plenty of room for difference of opinion. Too much examining is, no doubt, a bad thing, especially if it causes the time and energy that should be devoted to teaching proper to be diverted to preparing for examinations—in other words, to cramming. On the other hand, it is indispensable to have some ready method of testing the efficiency and conscientiousness with which our three thousand teachers discharge their important duties. Coming to details, Dr. Gercke is of the opinion that there has been much progress in the teaching of reading, spelling, and definition, inasmuch as the parrot-like spelling-lessons and the learning of definitions by rote which were once so much in vogue have fallen into discredit and given way to more rational methods. In the teaching of grammar, however, much remains to be wished, in spite of recent improvements. In arithmetic there is still too much adhesion to antiquated methods, not enough attention being given to mental arithmetic, which is so valuable in inducing mental readiness and flexibility. Geography is better taught than formerly, and with better results, but not enough attention is given to map-drawing. History of the United States shares in the improvement, but all other history is still utterly neglected. The department of physical culture continues in a very unsatisfactory condition. Of course, Dr. Gercke is an ardent advocate of the teaching of German as a regular and compulsory branch in all the schools. This vexed question is one that should be decided entirely on practical grounds. The point is, whether the attainable results are proportionate to the time spent in attaining them; and perhaps the only way of settling this is by actual experiment, as has been done for some years past. The prospect now is that, whether correctly or not, the controversy will be ultimately decided in favor of German.

—Dr. Gercke is a warm admirer of the Normal College, which he considers on the whole, and in spite of various faults, a well-organized

and useful establishment. He is also favorably disposed toward the College of the City of New York, and, so far from agreeing with those who from time to time engage in futile attempts to abolish it, he would rather develop the school system in the direction of high schools, considering that no system of public instruction can be called complete which confines itself to the lower branches. He considers it strange that while the cost of the city college is so often urged against it, the much greater comparative expensiveness of the Nautical School, $249 per pupil, is never mentioned. One feature of our system meets with his unqualified approval: not only does the city furnish its school-children with all the text-books and stationery they need, but it does so at the remarkably low average cost of 90 cents per annum per pupil, the entire expenditure for this purpose in 1881 having been only $119,161. In summing up the results of his observations, Dr. Gercke concludes that while our city school system has reached so mature a state of development that all attempts to introduce radical innovations must prove abortive, on the other hand it shows much aptitude for reform and improvement, for which there is still a great deal of room, and that its principal danger lies in an excessive straining after uniformity. Fortunately, it has been kept entirely free from sectarianism, and it has demonstrated its capacity for producing secondary or higher schools. The general management is characterized by economy and honesty. The chief defect, aside from those already adverted to, is the lack of a body of trained teachers. Nine-tenths of the instructors are women, who only teach till they marry, and, even of the men, many take up teaching only as an *ad-interim* occupation while they are preparing for some better-paid and more-considered profession. There is only one way of obviating this trouble, and that is by raising salaries. This will necessitate an increase of expenditure, while the current cry is for economy. Proper economy is a good thing. It is a good thing to insist on getting one's money's worth, and to object to being cheated; but it is foolish economy, when you have made up your mind that you must have a thing, to refuse to pay a just price for a good article.

—Something more detailed than the account given by the biographical dictionaries of the architect Du Cerceau, who is referred to by our Paris correspondent in connection with the Château of Chantilly, will be found in the current quarterly issue of *L'Art* (J. W. Bouton), together with views of certain buildings in Orléans attributed to him. Champfleury, who had already paid homage in *Le Livre* to the pencil of Tony Johannot, returns to the subject and to his brother Alfred, and adds further facsimiles of their works. Delacroix is the theme of M. E. Chesneau, in several chapters, and a portrait of him is annexed, but there is a great distance between his sketch of a lioness overpowering a man and most of his other pen-drawings reproduced here. Far more interesting we have found the outline landscapes of Aligny, remarkable for their breadth, firmness, and proportion. Several of them depict the environs of Naples, with more than one masterly sketch of Vesuvius. This artist was not much of a colorist, we are told by M. René Ménard; at least, his sense of form was supreme. But he had one curious distinction: "Never, in the history of the *prix de Rome*, since France has sent her laureates to the Villa Medici, has a single one of them been struck with the magnificences of the Roman Campagna. To comprehend and interpret these required a man alien to the École, and having, in the presence of nature, no other guide than his personal feeling. This man was Aligny." Full-page etchings abound in this as in the previous volume of *L'Art*, but for us none of them surpass in interest the portraits of Corot and Courbet, or are technically more noteworthy than, say, the varied wood-cutting of M. Puyplat. The face and the works of G. F. Watts, the English painter, are celebrated in these pages, where also much may be read and seen concerning the late Hamilton Palace collections, as well as the Salon of 1882.

—An interesting relic has been found in the Public Library of Besançon, a manuscript which formerly belonged to the *librairie* of the Louvre. (The early French employed this word "bookery" as we use library, though now they have confined it, as did the Romans—the writers at least—to a bookseller's shop, and have substituted the Greek and Latin bibliotheca, which has a more learned sound, though it be, after all, only "bookplace.") It contains, as says an inventory of 1373, "le gouvernement des roys et princes, le livre de Moralitez, Boèce de Consolation des Philosophes, l'Establissement de Sainte-Eglise, le Miroer de la Messe, Ysopet et la Misère de l'Omme." And on the last page of the volume, so carefully erased that only a photograph was able to render the words at all legible, was the inscription, in the autograph of Charles V., founder of the *librairie du Louvre*, "En ce livre Roman sont conteneus pluseurs notables et bons livres et est à nous Charles le Ve de notre nom Roy de France et le fîmes escrire et parfere l'an M-CCC-LXXII Charles." The book disappeared from the Louvre between 1413 and 1424, and after various fortunes, in the course of which it was valued, in 1607, at 6 francs (it would now fetch 10,000), it was bequeathed to the Public Library of Besançon in 1694.

—In the new complete and *ne varietur* edition of Victor Hugo's works now publishing in Paris, and to be complete in some forty-five or fifty portly volumes, the latest issue is the third volume of the dramas, containing "Lucrèce Borgia," "Angelo," and "Marie Tudor." In this volume appears for the first time a mass of new passages now printed from the original manuscript. Among these passages are many of minor importance omitted here and there from "Lucrèce Borgia," and one whole act hitherto left out of "Angelo." It is now announced in Paris that "Le Roi s'amuse," produced originally at the Théâtre-Français in 1832, and forbidden by royal mandate after the first performance, is to be acted for the second time at the Théâtre-Français, just fifty years since it was seen there for the first time. M. Got is to play the jester *Triboulet*, known in opera as *Rigoletto* and in English drama as *Bertuccio*. The *Literary World's* recent attempt at a Hugo bibliography, by the way, being apparently almost wholly derived from M. Barbou's biography, was very far from exact or adequate.

—The Jesuits of the House of the Holy Virgin at Laach have recently issued the sixth volume of the 'Collectio Lacensis Sacrorum Conciliorum Recentiorum' (Freiburg: Herder), which ought to complete the work; but we find that the Vatican Council is reserved for a seventh and concluding volume. This undertaking supplements and completes the great collections of the last century by Hardouin and Labbe, Coleti and Mansi, and places within reach of the student a vast mass of material illustrating the development of Catholicism in both hemispheres, which it would be almost impossible for him to obtain in any other form. So long as religion is one of the most powerful factors in human affairs, no one can form a correct conception of secular history without paying close attention to ecclesiastical movements, and this is especially the case with Catholicism, whose pretensions bring it constantly into contact, and frequently into collision, with the state. For the periods prior to the present century, the older collections of councils afford substantially all the assistance in this direction to be looked for from the authentic exposition of the wishes and aspirations of the Church in its synodical gatherings; for during the eighteenth century these almost ceased to be held. The renewed activity of the Church in recent times has, however, expressed itself largely in a revival of these assemblies, and the student has long felt the need of such an authorized collection of their "Acta et Decreta" as the industry of the Jesuit Fathers has here supplied.

—Such of our readers as are interested in that branch of mediæval literature which goes under the title of "Visions and Wanderings" will be gratified to learn of the following publication: 'Visio Tnugdali, lateinisch und Altdeutsch,' published by Albrecht Wagner (Erlangen: Deichert, 1882, pp. lxxii.-186). The editor gives a Latin version in prose, another in verse, fragments of a poem in Lower-Rhenish, and the *Mittelhochdeutsch* poem of one Alber. The editing is based upon a careful collation of numerous manuscripts, especially for the Latin. "Visions and Wanderings" are chiefly interesting to us because of their relations to Dante. Ever since the publication of Labitte's essay, 1842, and the more comprehensive works of Ozanam and Thomas Wright, it has been well known to Dante scholars that the great Italian poet did not invent the framework of his 'Commedia.' Mediæval literature offers a whole cycle of legends in which hell, purgatory, and paradise are described in the form of a vision—*i.e.*, as if visited by a human being in a state of trance. Thus, there is the Vision of Alberic, the Purgatory of St. Patrick, Paul's Journey to Hell, etc., etc. One of the earliest and best known is that of Fursæus, given by Bede in his 'Historia.' The editor goes too far, perhaps, when he asserts (p. vii.) that a continuous chain of such legends can be traced back "bis zum Beginn des Christentums." There are a good many gaps, and we doubt if any one legend can be placed as early as the first, or even second, century with perfect conclusiveness. Irish monks appear to have had a large, if not the largest, share in shaping these legends, and giving them currency. Thus the writer of the present 'Visio Tnugdali is undoubtedly an Irishman (see p. xxiii.); but we need not, therefore, conclude that vision literature is of Irish, or even of Christian, invention. The descriptions of the nether world in the 'Æneid' and in the 'Odyssey,' not to speak of similar passages in classic literature, may very well have prompted the movement. And when we connect "visions" with "wanderings'—*e. g.*, the voyages of Brandan and Maeldan—and consider what a part was played in later Greek literature by such ethnographic fables as the Argonautic expedition, the travels of Pytheas (part of which are genuine), Ktesias, Megasthenes, the marvels and wonders in the Alexander fable (Pseudo-Kallisthenes), we shall scarcely err in assigning to all mediæval tales of the kind a Greek-Oriental origin. Perhaps we may even trace them back to that great literary beehive, the fables of Brahmanism and Buddhism. Perhaps we may go back still further, and recognize their prototype in the popular story-telling of Old Egypt. See the story of the "Naufragé" in Maspero's 'Contes' and the London *Academy*, July 8, p. 24.

MAJOR DI CESNOLA'S SALAMINIA.

Salaminia (Cyprus). The History, Treasures, and Antiquities of Salamis in the Island of Cyprus. By Alexander Palma di Cesnola, F.S.A. With an Introduction by Samuel Birch, Esq., D.C.L., LL.D., F.S.A. ; and with upward of 700 illustrations, and map of Ancient Cyprus. London : Trübner & Co. 8vo, pp. xlviii.-330.

MAJOR DI CESNOLA, the writer of this volume, describes himself as a soldier by profession, and "an enthusiastic digger-up of antiquities" by position. He is not to be confounded with his brother, the better-known explorer of Cypriote antiquity, General Luigi Palma di Cesnola, the Director of the Metropolitan Museum of Art in New York. His book justifies the modesty of his claims as an archæologist, but its full title is a little misleading. The "History" of Salamis promised by it, and for which students of the past would naturally look with the hope that new discoveries had thrown light upon the subject, is a compilation from old and familiar authorities which occupies but two or three pages. The author tells us in his text that the city of Salamis is situated in the middle of the eastern coast of Cyprus, and is careful to warn his readers by a note that "this site must not be confounded with the island of Salamis off the west coast of Attica," etc., etc. But, if the "History" of Salamis is thus slighted, the "Treasures and Antiquities" are not much better treated. There is no topographic sketch of the site, no general description of the ground and of the character of the remains, whether those of tombs or temples ; there is no attempt to give any connected account of discoveries, or to study the field from the point of view of archæology proper. Even the 700 illustrations announced in the title shrink into more moderate proportions when we find that 375 of them are obtained by enumerating the small objects grouped upon twenty full-page plates. And the "map of Ancient Cyprus" turns out to be not made up from original investigations, but merely a reproduction of the map published by Ortelius in 1581—exceedingly creditable for that time, but far beneath the level of modern knowledge.

The book is, in truth, little more than an illustrated catalogue of a considerable collection of antiquities dug up, not at Salamis only, but at other sites as well, and which does not contain any objects of the first order of interest, while it affords few specimens that exhibit features novel to the student of Cypriote antiquity, or add essentially to the knowledge of it. As a catalogue of such vases, terra-cotta figures, lamps, and other minor articles as form the staple of any large collection of antiquities from Cyprus, and of those rarer objects of more precious material—ornaments of gold and silver, engraved gems, works in alabaster, crystal, and ivory, of which there is such a rich display in the New York Museum—the volume of Major di Cesnola has its value. Like the collection it describes, it contributes little to the increase of real knowledge, but it makes very considerable additions to the stock of familiar facts ; and, in view of his ignorance of archæology, the book is creditable to its author in its general freedom from additions to the stock of familiar errors. Its pages are, indeed, not free from loose statements, of which the Preface affords one rather striking example. On p. xx. Major di Cesnola tells us that he arrived "in Cyprus at the end of July, 1876," and "in the month of August was ready to resume researches," while on p. xxi. he states, somewhat to the surprise of the attentive reader, that "from the end of June until October, 1876, I was obliged to suspend work." There is no reconciliation of these statements.

The introduction, by Dr. Birch, points out the objects of chief interest in the collection, and contains some critical remarks upon them. Dr. Birch has a reputation as a scholar, but, whether from his devotion to Egyptian hieroglyphics or from some more recondite cause, his English style is often of worse than Egyptian obscurity. The introductions he has furnished to successive volumes of the translations of Egyptian and Assyrian texts published by the Society of Biblical Archæology may have prepared the reader in a degree for what he finds here; but it is not without a fresh sensation of wonder that he comes upon sentences like the following :

"A class of objects, also of Phœnician fabric, are the scarabæi made of hard stones. These scarabæi were made on the island as well as imported. The earlier engraved were followed by the usual Greek intaglios, and many of the period of Greek and Roman dominion are in the collection. These are principally of the later period of art, and probably made in Cyprus, as under the Ptolemies there was a mine in the island."

What mine was in the island at one time that was not there at another is not obvious, and what the existence of a mine has to do with the local carving of gems is a puzzle. Again, he says : "Silver contemporaneous with the earliest period does not *retain its preservation* so well as gold"—preservation being a quality not hitherto, so far as we know, attributed to either metal. He informs us that many specimens of ancient glass "exhibit a rare iridescence of colors," not satisfying the natural curiosity as to what other iridescence they might be expected to exhibit. But perhaps his most remarkable statement (the choice is large) is that "the great peculiarity of early Cypriote art is the employment of birds in its earliest development." We are tempted to give longer specimens of Dr. Birch's peculiar employment of words, but these are enough to show its nature ; and they would be simply amusing were it not for the regret that they awaken that a scholar should write in so slovenly a style, and that often, instead of elucidating, he should darken the subject which he treats. Dr. Birch's reputation will hardly be able to stand his own attacks upon it.

This book will do nothing to alter the judgment already formed by students of Cypriote art as to its general character. The antiquities found in the island present a curious and instructive medley of Egyptian, Assyrian, Phœnician, and Greek works. Cyprus imported the greater part of her art. What her native artists produced was affected by the influence of foreign methods, both in technical quality and in the forms of expression. Such originality as her artists exhibit gives evidence of a low order of civilization, as compared with that of Egypt on the one hand and of Greece on the other. A refined sense of beauty is seldom manifest in any of the higher forms of her art, and there is no display in them of the poetic imagination. Cyprus never embodied a lofty type of ideal loveliness, never expressed a deep sentiment by strokes of vigorous realism. No building noble from its harmonies of proportion ever stood upon her soil. Her sculptors lacked the discipline of marble, and, though bronze was at their command, they preferred to work out their conceptions in soft stone or softer clay. The exquisiteness which their work sometimes exhibits is an exquisiteness purely external—of hair, of garlands, of ornaments. The faces they have preserved for us are of men and women who lived soft lives, and pleased themselves with sensual more than with intellectual delights. Cyprus never produced a great artist ; the service of the Cyprian goddess forbade. Aphrodite and Athene are the divinities of different breeds of men.

LUBBOCK'S ANTS, BEES, AND WASPS.

Ants, Bees, and Wasps. A Record of Observations on the Habits of the Social Hymenoptera. By Sir John Lubbock, Bart., M.P., F.R.S., etc. [International Scientific Series, Vol. xlii.] D. Appleton & Co. 1882.

THE author remarks in his Preface :

"This volume contains the record of various experiments made with ants, bees, and wasps during the past ten years. . . . My object has not been so much to describe the usual habits of these insects as to test their mental condition and powers of sense. . . . The principal point in which my mode of experimenting has differed from that of previous observers has been that I have carefully marked and watched particular insects ; and, secondly, that I have had nests under observation for long periods—even for seven years."

The work embraces eleven chapters and a somewhat extended Appendix, containing the detailed records of some experiments and descriptions of a few species. There are also five excellent colored lithographic plates, thirty-one figures in the text, a full index, and a list of nearly seventy books and papers referred to. Of the single short chapter devoted to wasps, the most interesting portion describes the life and pathetic death of a *Polistes gallica*, which the author kept for no less than nine months, "during several of which I never saw her sting." Perhaps now some one will undertake to tame an American hornet. A second, somewhat longer, chapter is given to bees, upon which the author had intended to make most of his observations ; "but I soon found that ants were more convenient for experimental purposes, and I think they have also more power and flexibility of mind. They are certainly calmer and less excitable." The introductory chapter gives a condensed but clear account of the life-history of ants. These insects form three families, and more than a thousand species are known, of which rather more than thirty inhabit England. The author has kept in captivity about half of the British species, as well as a considerable number of foreign forms, and for the past few years has generally had from thirty to forty communities under observation. The remaining chapters deal with "The Formation and Maintenance of Nests and the Division of Labor," "The Relation of Ants to Plants," "The Relations of Ants to other Animals," "Behavior to Relations," "Recognition of Friends," "Powers of Communication," and "The Senses of Ants." In treating all these subjects, our author deals fully and fairly with what has been written thereon by others.

The chapter on "The Relations of Ants to other Animals" contains an account of the remarkable institution of slavery among ants, first discovered by Huber. It is now known that several species enslave other species, and become more or less dependent upon them, and Lubbock characterizes the several degrees as follows :

"These four genera offer us every gradation, from lawless violence to contemptible parasitism. *Formica sanguinea*, which may be assumed to have comparatively recently taken to slave-making, has not as yet been materially affected. It is predatory, but can do for itself, and, if necessary, carry on a nest without slaves.

"*Polyergus*, on the contrary, already illustrates the lowering tendency of slavery. They have lost their knowledge of art, their natural affection for their young, and even their instinct of feeding ! They are, however, bold and powerful marauders.

"In *Strongylognathus*, the enervating influence of slavery has gone further, and even told on the bodily strength. They are no longer able to capture their slaves in fair and open warfare.

"In *Anergates*, finally, we come to the last scene of this sad history. . . . They are weak in body and mind, few in numbers, and apparently nearly extinct, the miserable representatives of [presumably] far superior ancestors, maintaining a precarious existence as contemptible parasites of their former slaves."

That some ants assume the charge of large numbers of plant-lice (Aphides), and actually "milk" from them the sweetish juice which they exude, has been long known; in addition, there have been found in ants' nests a few other insects under circumstances indicating "that some of them may be kept as *pets*."

The peculiar value of the present work rests in the fulness and accuracy of the record of the author's personal observations and experiments. Extending as they did over days and weeks for a single insect or community, it was fortunate that efficient aid could be rendered by his two daughters and their governess. In some instances an entry was made every two or three minutes for at least twelve hours respecting the doings of a single ant. The individuals under observation were ingeniously distinguished by painting their backs with different colors. Few naturalists have manifested the patience to conduct such experiments, and fewer still, perhaps, the power of so arranging the numerical records that their true significance may readily appear. And yet Sir John Lubbock is likewise a leading banker and an active member of Parliament.

Very interesting and instructive are the experiments with *intoxicated* ants, in order to ascertain how far a discrimination was made between friends and strangers, such as would show a recognition of the former notwithstanding their abnormal condition:

"The general results were that the ants removed forty-one friends and fifty-two strangers. Of the friends, thirty-two were carried to the nest, and nine were thrown into the water. Of the strangers, on the contrary, forty-three were thrown into the water; only nine were taken into the nest, and seven of these were shortly afterward brought out again and thrown away. Indeed, I fully believe that the other two were treated in the same manner. . . . It seems clear, then, that even in a condition of insensibility these ants were recognized by their friends. . . . The sober ants seemed somewhat puzzled at finding their fellow-creatures in such a disgraceful condition, took them up, and carried them about for some time in a somewhat aimless manner."

The following statements certainly merit the attention of many human families and communities:

"So far as I can observe, ants of the same nest never quarrel. I have never seen the slightest evidence of ill-temper in any of my nests; all is harmony. Nor are instances of active assistance at all rare."

For example, an ant lacking the antennæ lost its way, was set upon by ants of another species, and left wounded and helpless on the ground. An ant from its own nest found it, "examined it carefully, then picked her up carefully and carried her away into the nest."

"While the utmost harmony reigns between those belonging to the same community, . . . if a stranger is introduced, she is at once attacked. This implies that all in one community have the power of recognizing one another, a most surprising fact when we consider the shortness of their life and their immense numbers. In the large communities of *Formica pratensis* there are probably from 400,000 to 500,000 ants."

Our author concludes that "the recognition is not personal or individual, . . . yet that the fact that they recognize their friends, even when intoxicated, and that they know the young born in their own nest, even when they have been brought out of the chrysalis by strangers, seems to indicate that the recognition is not effected by means of any sign or password." What, then, is the means of communication? Notwithstanding the somewhat vague assertions of previous writers, Lubbock concludes, from his own careful experiments, that "when an ant has discovered a store of food, and others flock to it, they are guided in some cases by sight, while in others they track one another by scent."

In other experiments, the food—a fly or spider—was so pinned to a board as to prevent the ant which first found it from carrying it to the nest, and the fact that the ant returned with several companions apparently to aid in securing the prey, disposes our author to accredit to ants "something approaching to language." But even here the protracted efforts to move the prey may have caused its scent to adhere to the ant. Certainly, any other means of communication must have been very imperfect, for none of the ants summoned went directly to the prey, or even followed the guide, and some never found the former at all. In some cases, too, they "had all the appearance of having come out reluctantly, or as if they had been asleep, or were only half-awake," as if the harmony so strongly dwelt upon were of a passive rather than an active character. Indeed, our author relates several cases of almost wanton neglect of members of the same community, which show that "tenderness is not invariably the rule; . . . that there are individual differences among ants—Priests and Levites and Good Samaritans—as among men" (p. 101).

The most conclusive experiments respecting the power of communication are described on pages 172–175: "During fifty-two hours, the ants which had access to a glass containing numerous larvæ brought 304 friends; while, during fifty-nine hours, those which were visiting a glass with only two or three larvæ brought only 104 to their assistance." It is difficult to see how information as to the *greater number* of objects to be moved could be given excepting by some kind of language. What the ant's language consists in is still undetermined. To all sounds producible by human instruments, Lubbock concludes that ants, like bees and wasps, are insensitive; but he is disposed to think that they may perceive sounds which we cannot hear (p. 233). As to the other senses, "there can be no doubt whatever that in ants the sense of smell is highly developed"; moreover, ants have two kinds of eyes, simple (ocelli) and compound, and it is clear that they see therewith, but the precise mechanism is "difficult to understand." From a series of ingenious experiments with variously-colored media, our author concludes that ants are not sensitive to the ultra-red rays, but perceive the ultra-violet rays, and that the colors of objects and the general aspect of nature presents to them a very different appearance from what it does to us (p. 220).

From the most general point of view, the present work has three aspects—(1) as a record of personal observation; (2) as a digest of these observations in combination with those of other writers; and (3) as a discussion of the ultimate significance of the facts and considerations so attained. Upon the first two points nearly unqualified praise is due to the author's ingenuity, care, patience, and candor. The following paragraph well illustrates also his anxiety to avoid an error of proximate interpretation:

"Every one knows that if an ant or a bee in the course of her rambles has found a supply of food, a number of others will soon make their way to the store. This, however, does not necessarily imply any power of describing localities. A very simple sign would suffice, and very little intelligence is implied if the other ants merely accompany their friend to the treasure which she has discovered. On the other hand, if the ant or bee can describe the locality and send her friends to that food, the case is very different" (p. 160).

When, however, our author passes from facts and their immediate significance to a discussion of their broader psychological aspect, his remarks are less satisfactory, as may be judged from the following passages:

"In the face of such facts as these, it is impossible not to ask ourselves, How far are ants mere exquisite automatons; how far are they conscious beings? When we see an ant-hill, tenanted by thousands of industrious inhabitants, . . . each one fulfilling its duties industriously and without confusion, it is difficult altogether to deny to them the gift of reason; and the preceding observations tend to confirm the opinion that *their mental powers differ from those of men not so much in kind as in degree*" (p. 181).

"The Anthropoid apes no doubt approach nearer to man in bodily structure than do any other animals; but when we consider the habits of Ants—their social organization, their large communities and elaborate habitations, their roadways, their possession of domestic animals, and even, in some cases, of slaves—it must be admitted that *they have a fair claim to rank next to man in the scale of intelligence*" (p. 1).

The concluding portions of these two extracts are italicized, because they will impress most readers not only as unsubstantiated by what is related in the first seven chapters of the work, but as absolutely refuted by some of the experiments described in chapter ix. The author found that ants would carry larvæ at least thirteen feet up and down nearly vertical sticks rather than fall about two-fifths of an inch. In another experiment, "they tried in vain to stretch up from the earth to the glass, which was just out of their reach, though they could touch it with their antennæ; but it did not occur to them to heap up the earth a little, though if they had moved only half-a-dozen particles they would have secured direct access to the food. . . . I was the more surprised at their want of ingenuity in constructing bridges on account of the ingenuity with which they avail themselves of earth for constructing their nests" (pp. 248, 249). Without insisting unduly upon metaphysical distinctions, do not the foregoing facts illustrate the commonly-accepted difference between instinct and intelligence, between an inherited skill in the performance of certain acts and a capacity for adaptation to new conditions? Unless, however, the passages above quoted are to be regarded as the insufficiently revised expressions of a very natural enthusiasm respecting the special and almost peculiar objects of his study, the author, a President of the British Association for the Advancement of Science, believes that no animal other than man would venture to drop a distance little greater than its own length, and easily spanned by its limbs, rather than perform a really toilsome journey.

Upon the whole, it is to be wished that Sir John had either omitted these passages altogether or devoted an entire chapter to the comparative psychology of his favorites. The space for such a chapter might well have been gained by condensing the typographical arrangement of some of the numerical records—as, *e.g.*, those upon pages 162, 163, 297, 301, 367-370, etc.—and by omitting the technical descriptions of new species.

RUGE'S HISTORY OF OUR TIMES.

Geschichte unsrer Zeit, von den Freiheitskriegen bis zum Ausbruche des deutsch-französischen Krieges. Von Arnold Ruge. Leipzig and Heidelberg.

Arnold Ruge—whose long life, embracing successive periods of participation in the *Burschenschaft*, imprisonment, professional activity, editorial work, revolutionary agitation in the Fatherland, conspiracy in exile, and quiet authorship, came to a close in England on the last

day of 1880—could justly boast of having gone through the events of his time not merely as a spectator, but as one who had a part, though a *pars minima*, perhaps, in shaping them. And as a thinker, observer, and actor, familiar with men and things and theories, he had a right to bequeath to us, as he has done, a history of the age. In composing it, however, the ardent Neo-Hegelian theorist and revolutionist was less bent on telling what he had witnessed and observed, learned and unlearned, in the course of his checkered career at home and abroad, than on proving to his readers that his Neo-Hegelian views of civilization and progress, of reason and the spirit of the age, of self-government and equality, of the futility of political reaction, of the irrepressible advance of science and the doom of religion, are fully justified and brilliantly illustrated by the struggles and vicissitudes of the century. He narrates little, illumines the salient points of the history with fugitive rays, and abstracts from this light a dogmatic vindication of his extreme historical optimism: The civilized world is triumphantly marching ahead toward material felicity, self-rule, ethical elevation, and freedom from caste and belief. Napoleons, Bourbons, Metternichs, Jesuits, popedom, the slave power, the Church, can form only temporary obstacles in the path of the free spirit; they are all doomed to be successively crushed by it; they even serve it, unconsciously and unwillingly, and help to destroy each other. The *Hallesche Jahrbücher* of 1838–40, the *Deutsche Jahrbücher* of 1840–43, the *Reform* of 1848 were right; their editor has unlearned nothing. Leipzig, the barricades of 1830 and 1848, Solferino, Appomattox Court-House, Sadowa, Sedan have righted many a thing; Világos has been, and Warsaw will be, avenged. The republican philosopher and poet whom the renovated German Empire pensioned at the close of his life dies happy in his faith. He is far from recanting anything. Hear his introductory retrospect, for instance:

"The German reformers of the sixteenth century rebelled, not against superstition, but only against the commonwealth of superstition, the hierarchy and its president, the Pope. In lieu of the spiritual hierarchy they set up spiritual anarchy—a sound principle, for the spirit has no master—but they did it in the name of superstition, and they were, indeed, greater believers than the Pope and the Cardinals; they made the story-book of the Jews and Christians the norm of thought and source of truth; they replaced the authority of the hierarchy by the authority of the 'holy writ'; and, though they recognized no other but the 'invisible' Church, they never thought of banishing the mediæval spirit, Christianity: the more absurd a story sounded, the more edifying it was to them. They made no serious attempts to discover the sense of the dogmas and myths, or to realize morality; the old conflict between heaven and earth remained. . . . Still less did the Reformation attack the social and political institutions of the Middle Age, feudalism and despotism. . . . The French in the eighteenth century were the first to take this step, setting up science in lieu of religion, in lieu of feudalism the right of the individual, and in lieu of despotism or absolutism the free state, the republic. The historians who even nowadays close the Middle Age with the advent of the Reformation call neither the Middle Age nor its opposite by the right name: they still cherish a fondness for its spiritual slavery, the Christian faith, and for its external slavery, the feudal exploitation of man and despotic rule."

The same uncompromising spirit pervades the whole book, and its tone is aggressive throughout. It is history written, or rather discussed, by a combatant; there is plenty of invective, of piquant sallies, and animated protests, amid which the facts are often largely, and the details entirely, skipped over. The philosophy of the history is the main point; the work is to be a prose epopee of the modern idea; even the men who carry the victorious banner are treated with neglect. The author surely does not forget his revolutionary associates, Kossuth, Mazzini, or Ledru-Rollin, nor does he forget himself; but he wastes very little praise on any man—Canning is perhaps the only exception—and his egotism is of a very mild kind, and not unamiable. Adulation he is entirely free from, and the adoration of the German spirit and virtues which disfigures so many German writings, is equally alien to him. In fact, he has preserved unimpaired his enthusiastic admiration of the great *journées* of revolutionary France. The 14th of July and 4th of August, 1789; the last days of July, 1830; the 24th of February, 1848; and the 4th of September, 1870, are still to him the sacred dates in the calendar of self-emancipating humanity. The massacre and guillotine days of 1792, 1793, 1794, and 1871, fortunately, do not fall within the scope of his sketch. Nor is he inclined to expatiate on crimes or errors committed on the revolutionary side in a contest. Thus he faithfully records the atrocities committed by the Turks on the Greeks in 1821, but makes no allusion to the horrors of Tripolitza, where—after a partial capitulation and surrender—ten thousand Turkish men, women, and children perished in a three days' uninterrupted butchery, followed by equally horrible massacres in the surroundings. "Colocotronis took Tripolitza by storm"—this is all our author says about the affair, forgetting that Colocotronis boasted that his horse, stepping over piles of the massacred, nowhere touched the ground between the walls and the palaces, and that he reckoned the number of the butchered at 32,000. "By honest victories did the Greek avenge cowardly massacres and atrocious desolation," says our author. But in *discussing* history deductively, and pleading for an historical dogma, one must not be too precise in stating facts.

It is a pity that there is also some unintentional looseness in the author's way of stating facts: a looseness of diction which often distorts the statements. When, for instance, he says, "Karl Albert rückte vor, ging am 8. April über den Mincio und die Etsch," he means to state that the King of Sardinia crossed the Mincio on the 8th, and the Adige weeks later. When he says, "Pio nono . . . wurde am 11. December als weltliches Oberhaupt abgesetzt und flüchtete nach Gaeta," he reverses the order of events, for Pius IX. fled to Gaëta on November 24. In the phrase "Görgei, Perczel, Klapka und Bem schlugen die Croaten" the word *Croats* is used figuratively for all the various defenders of the Austrian cause in Hungary. When our author says, "Am 12. Juni, 1864, setzte Louis Napoleon auch wirklich seinen Kaiser in Mexico ein; . . . aber dies war gerade das Jahr, in dem General Grant Richmond nahm und Jefferson Davis gefangen geführt wurde," his statement, if not originating in a slip of the memory, can be excused only on the assumption that "das Jahr" does not refer to the year 1864, but to a twelvemonth embracing both June, 1864, and the spring (April and May) of 1865. Unfortunately the book is also disfigured by a large number of absolutely false dates, some owing to defective revision and proof-reading (the publication is posthumous) and some to the use of untrustworthy materials. Among those we have noticed are the dates of the evacuation of the citadel of Milan by Radetzky (March 20 for March 22), of the proclamation of the republic of Venice (March 20 for March 23), of the battle of Custozza in 1884 (July 24 for July 25), of the capture of Buda by Görgei (May 26 for May 21), of the battle of the Alma (Sept. 26 for Sept. 20), of the naval duel at Hampton Roads (March 7 for March 9), of MacClellan's fight before Richmond (July 1–5 for June 26–July 1), of the battle of Chancellorsville (May 1–2 for May 2–4), of the battle of Gettysburg (July 31 for July 1–3), of Grant's advance in 1864 (June 5 for May 4), of the battle of Spottsylvania Court-House (June 11 for May 10–12), and of the evacuation of Richmond (April 5 for April 2). In spite of its various shortcomings, however, we can recommend this 'History of Our Times' as not only readable, but instructive. It is as suggestive as it is one-sided.

Camps in the Rockies. By W. A. Baillie-Grohman. Chas. Scribner's Sons.

AMONG the legion of books on the Far West in its various aspects which have appeared since King's 'Mountaineering in the Sierra Nevada,' we have found none so fresh, so full of the breath of its Alpine woods and peaks, and giving withal so fair and representative a view of frontier life as Baillie-Grohman's 'Camps in the Rockies.' His sketches, like those of Mr. King, are founded on personal explorations involving hardships and dangers of no trivial nature; and though, from a literary point of view, Mr. Grohman's style wants the ease, fluency, and grace of the former, and he writes rather from the standpoint of the sportsman than the scientist, yet his language is clear and concise, and his experiences and observations are given with a frankness and modesty, free from all attempt at fine writing, which carry the reader with him, and leave no trace of a feeling that he has been romancing or drawing the long-bow.

Mr. Grohman is essentially an Englishman, although his father was an Austrian of high standing at the Imperial Court, and he himself was brought up among the Tyrolese Alps, where he gained his first taste for hunting at an early age in pursuit of the chamois, and later earned laurels as a member of the Alpine Club in peak-climbing. His first literary venture was a little book on 'Tyrol and the Tyrolese,' founded on his experiences among the mountains and peculiar people of whose life we get such charming glimpses in Tautphœus's novels. An enthusiastic sportsman and mountaineer, and an earnest student of nature, Mr. Grohman came to this country some three or four years since, to shoot some of its big game and compare its people and their mountains with those among which he had spent his youth. His first season's experience was mainly useful in familiarizing him with the ways of the West, and teaching him "how not to do it." In succeeding excursions, therefore, instead of providing a large and expensive outfit, after the manner of the "top-shelfer," he associated himself on equal terms with a little band of hunters and trappers, with whom he spent several seasons among the mountains, suffering many personal discomforts, and obtaining an intimate knowledge of the country and of his companions that could hardly have been got in any other way. In his selection of hunting-ground Mr. Grohman was also exceptionally fortunate. Owing to the fierceness of the Indian tribes to whose reservation it belonged, the wild and mountainous region of northwest Wyoming had seldom been visited, even by the hardy trappers. With the discovery of the wonders of the Yellowstone Park on its northern border, and its subsequent exploration by various Government expeditions, that portion has become comparatively well known; but the region lying to the south, between it and the Green River basin, comprising the mountain groups of the Wind River and the Sierra Shoshone, is still practically a *terra incognita*. Here our author found in abundance the game he sought—the grizzly bear, mule-deer, big-horn, and wapiti (commonly, though erroneously from a zoölogical point of view, known as the *elk*). The white mountain goat, which he was particu-

larly anxious to bag, as being the nearest representative of the chamois in this country, must, he found, be sought in more northern latitudes.

The chapters on the experiences of the sportsman and his three trapper companions contain many good descriptions of the characteristic scenery, and remarks on the habits of its game which will be of interest to the scientist as well as the general reader. Mr. Grohman's German blood shows itself in his close observation and accurate statement of fact. His own experiences, though wanting the blood-curdling episodes of most books on hunting, are yet full of interest because of the frank truthfulness of their narration, and the un-English capability on the part of the author of appreciating a joke, even when it is against himself. His solitary bear story may serve as an illustration:

"I was out on my usual preliminary bug-stalk; and going along with bent form, now hitting, then again missing my plump game, my whole attention being fixed upon my occupation, I reached a clump of dense service-berry bushes. I had just delivered a successful throw, and was about to stoop to gather in the prize, when out of the bushes, as if growing from the earth, there rose—a grizzly. Rearing up on his hind legs, as they invariably do when surprised, he stood, his head and half-opened jaws a foot and a half or two feet over my six feet of humanity, and hardly more than a yard between gigantic him and pigmy me. The reader will believe me when I say he looked the biggest grizzly I ever saw, or want to see, so close. It would be difficult to say who was the more astonished of the two, but I know very well who was the most frightened. My heart seemed all of a sudden to be in two places; for had I not felt a big lump of it in my throat, I could have sworn it was leaking out at a big rent in the toes of my moccasins.

"Now, grizzly-shooting is a fine healthy sport—I know none I am fonder of; but there ought to be neighboring trees to facilitate *centralization to the rear;* and above all, I must be handling my old 'trail-stopper'; and that moment I was here on a treeless barren *en face* with one I 'was not looking for' or 'had not lost,' and yonder, 100 yards off, lay that famous old rifle—Boreas [the horse], in the distance, putting some spare ground between him and that noxious intruder. Fortunately, the old Uncle of the Rockies had more than probably never had anything to do with human beings, for I saw very plainly that he was more puzzled as to my identity than I was regarding his. His small pig eyes were not very ferocious-looking, and first one, then the other, ear would move, expressing, as I interpreted it, more impatience than ill-feeling. I do not exactly remember who first moved, but I do recollect that on looking back *over my shoulder*, I saw the old gentleman actually running away from me! On regaining possession of my rifle, which on this quite exceptional occasion I had allowed to get beyond my reach, as it interfered with my 'buggings,' I felt considerably braver, and spent the rest of the day in a vain endeavor to resume our acquaintanceship on more satisfactory terms. But the old gentleman evidently thought he had frightened me sufficiently, and so kept out of my way."

Mr. Grohman had a great desire to see the most characteristic of all the wonders of the West, the cañons of Colorado. The fitting out of a boat expedition, however, being somewhat above the means of a private individual, he conceived the rather novel idea of exploring them in midwinter on the ice. This somewhat hazardous undertaking was successfully carried out by the aid of the officers of Fort Bridger, and forms the subject of his "Camps and Cañons on the Colorado River." In "Camps in Cowboy-land," he gives a graphic picture of the life of the cattle-raiser of the plains of the West, which is as free from exaggeration as the nature of the subject will allow of.

No inconsiderable portion of the book is devoted to the characteristic features of Western life and people, of whom Mr. Grohman is a hearty admirer; and, as a natural consequence, it abounds in Western stories, in which, however, Mr. Grohman has endeavored to avoid the rock on which so many English travellers have split—of swallowing whole the yarns with which the Westerner delights to regale the gullible tourist. To his English friends he gives a very practical piece of advice in regard to the necessity of carrying a revolver. Most travellers' books teach them that it is an absolute necessity, and, that when once they have crossed the Missouri River, "a man for breakfast" will be the order of the day. He reasons that it is not only unnecessary, but a disadvantage. In the first place, if they avoid disreputable places they will probably see or hear of no shooting. In the second place, if they do frequent such places, and get into an altercation with a Westerner "on the shoot," his practised fingers will have discharged the contents of his revolver before they can be quick enough to have drawn theirs. And, thirdly, such action on his part would be considered justifiable homicide if it was found that they carried a revolver on their persons.

The scenery of the West Mr. Grohman regards as in keeping with the character of its people, and possessing an essentially American character. It abounds in elements of sublimity and grandeur; but, as contrasted with the verdure-clad slopes and soft, hazy atmosphere of the Alps, the bare, rocky surfaces and the brilliant, garish atmosphere of the Rocky Mountains give an effect of crudity and newness, wanting the mellowing touch of time. Of the Western people he says, after briefly describing their prominent characteristics:

"If we look at the result of all this twenty years of experimentalizing, we see the unfinished, rough sketch of a country vast and great as few ever were, and as none other now is; peopled, as it would seem to me, not with a strange medley of race and temperament, as is so often remarked, but rather by a community about which there is a singular unanimity of purpose and a startling uniformity of character."

A Flight to Mexico. By J. J. Aubertin. With seven illustrations. London: Kegan Paul, Trench & Co. 1882. 8vo, pp. 325.

REGARDED merely as a book of travels, 'A Flight to Mexico' cannot take a very high rank, chiefly from the great freedom of digression which the author allows himself. At first it is rather amusing to have Mr. Aubertin thinking aloud, as it were, for our benefit, but it soon becomes wearisome and at times positively irritating. He jumps, for instance, in a single sentence from a reference to Brazil and its chief products to Mexico, and from thence, by the slender link of a Latin quotation, to Eton, ending with some trite remarks on "the ever-changing human brain." In another place he gives a long and dull account of a visit to the grotto of Adelsberg, in Austria, his excuse being that he did not see a somewhat similar cave in Mexico. These digressions, it should be said, are the most numerous and the most tiresome when Mr. Aubertin has the least to tell us, but they cease when we come to the important parts of his narrative.

He landed at Vera Cruz June 26, 1881, at a time when the yellow fever was raging with such violence that the captain of the English mail steamer "issued strict orders against any of the officers or crew going on shore for the few days the vessel was to stay there." The miserable sanitary condition of the chief port of Mexico, which "is, in some months, a mere pest-house," is naturally one of the chief obstacles to the growth of commerce, and to this fact the native press seems at length to be thoroughly awake. The mere traveller, however, is never compelled to pass a night in the port, but can take a mid-day train for the interior, which the railway company "always put on as far as Orizaba for passengers arriving by the packets." The inefficiency of the Custom-house officials is also the subject of Mr. Aubertin's criticism. French silks, he assures us, "can be bought cheaper in Mexico city than in New York, though the Mexican duty is double that of the American, and though the freight to Vera Cruz is higher than that to New York; not counting the freight on 263 miles by railway after the goods are landed." And he adds, with a certain air of incredulity, as if making a statement which he cannot expect his readers to credit, "Not only, it is said, are Custom-house positions given to individuals merely because they are poor, but sometimes to political agitators, merely to keep them quiet." Of the railway connecting the port with the city of Mexico, built and managed by an English company, Mr. Aubertin speaks in terms of the highest praise, both in regard to the excellence of its works and the beauty of the scenery. We have no space, however, to dwell upon this, nor upon the skill with which the engineers overcame the difficulties presented by the Sierra Madre in an ascent of 8,150 feet—difficulties so great that at Atoyac "the workmen were hung over the rocks by ropes to complete the cutting out of the line." The city of Mexico proved a disappointment. The scenery was not equal in grandeur to our traveller's expectations, the hotel was poor, the food bad, and the air pestilential. Though he found the city dull, yet it speaks well for the Mexicans that "bull-fights are forbidden within the federal or capital district," and that the sport is "denounced in more than one of the newspapers, the *Monitor Republicano* at their head, by whom it was coupled with gambling."

The principal silver mines which Mr. Aubertin visited were those of the Real del Monte Company at Pachuca, and the Santa Gertrudes. At one of the former the ore was still crushed and reduced in the most primitive fashion. Near the "treading-ground" of Regla was a "vast perpendicular wall of tall compact basaltic columns," similar to those found at Staffa and the Giant's Causeway, though far surpassing these latter, "as regards masses." Pieces cut from these columns "are rudely tied by a cord, and are run round and round in a broad trough of water and ore." After the requisite fineness is produced, "quicksilver and sulphate of copper are mixed with it, and horses are driven to and fro over the mess as we have seen them being driven round and round to thresh corn. Men, also, were at work after the same fashion, under roofing, recalling, but by violent antithesis, the treading of the wine-press! Men and horses of course suffer by this ugly and incomplete process; their feet and legs become gradually paralyzed, and the men are subjected at last to great trembling of the nerves, and thousands of ingots escape reduction and are lost." At a hacienda near by there had been set up some "elaborate machinery for extracting silver ore. . . . But it unhappily came to pass that on its being for the first time set to work, it was committed to incompetent and uninstructed hands, and in consequence of this some boiler or boilers had burst, by means whereof the whole affair had been thrown out of order and had been left in that abject condition ever since. Now, this is a fair sample of what is going on in the not-doing style in Mexico."

At Las Animas, near Orizaba, was a large coffee plantation, from which Mr. Aubertin brought home "two sacks, one of the double-bean, and one of the perola, or single-bean coffee." These were tested in London by a Rio coffee shipper, who pronounced them both to be "first-class coffees. As regards the perola, indeed, he ranked it with the best Java that he is in the habit of drinking. Mexico, with fitting population, could produce an unlimited quantity of coffee. She has coffee grounds in all parts, and coffee trees

in comparatively very few. This is a question of overwhelming importance to her, considering what a large market for coffee exists among her Northern neighbors. And all who have an interest in Mexico have a right to augur the most promising results from an extended cultivation of this plant." At another hacienda, Jasmine, not far distant, sugar was the chief production. But of this Mr. Aubertin does not speak so particularly, though he refers to the "vast plantations" of the sugar-cane through which he passed, and to the excellent machinery, including the centrifugal pans, which had been set up in the sugar-house of the estate. Having been instrumental in introducing the culture of cotton into the Brazilian province of San Paulo during our Civil War, it was natural that he should be interested in the attempts to introduce the growth and manufacture of cotton into Mexico. The only factory which he visited was the "Hercules," at Querétaro, the largest at that time in the country. It employed 1,200 hands, all of whom are "Indians, steady, attentive, and obedient." Their working-hours, the year round, are from five o'clock in the morning till half-past nine at night, with two intermissions, if he correctly informs us, for breakfast and dinner, aggregating an hour and a half. "The short staple cotton in use comes from the State of Vera Cruz; the long staple from the Pacific Coast; and rather more than half the raw quality employed is imported from the States." It may be said here that while Mr. Aubertin is confident that a time of great prosperity is in store for Mexico, in which her rich natural resources will be greatly developed, he is no less certain that the United States must furnish both the capital and the men who shall accomplish this peaceful revolution.

By a rare good fortune, one of the three companions of our author in the diligence on his journey to Querétaro was "the Government Assessor at the court-martial which sat in judgment on Maximilian and his two Generals"; and the second was a Colonel who "commanded a regiment at the execution." His host in the city, the owner of the "Hercules" factory, had entertained Maximilian in his house "when he made his imperial visit to the city in the early days of his aspiring to found a throne," and "supported him later, and more sadly, while he lay for five weeks an invalided prisoner in the convent of the Capuchinas." By the aid of this latter gentleman Mr. Aubertin obtained an interview with the priest who attended the unfortunate monarch in his last moments. From these various witnesses was received a detailed and presumably accurate account of the tragedy on the Cerro de las Campanas. It is a sad and touching story, in which treachery combined with a fatal weakness of character brought a brave man to an untimely end. Two incidents of the closing scenes of his life seem to us to show in a striking manner both the weakness and the nobility of Maximilian's character. "Just as they were leaving the Capuchinas Convent for the Cerro," said the Canon Soria, his confessor, "Maximilian pulled himself together, and striking his hand over his breast, said: 'I have doubled eight handkerchiefs over here to prevent my blood from soiling my uniform.'" On reaching the place of execution he said to General Miramon, "on the latter passing to the left in order to leave the centre for Maximilian, 'General, a brave man must be respected, even by sovereigns; permit me, then, on dying, to concede to you the post of honor.'" Oppressed with the failure of all his hopes, worn out with sickness, and believing his wife, the scarcely less miserable Carlotta, to be dead, there can be little doubt that he went willingly to his fate. "He said he always wished to die on a fine day," his confessor told Mr. Aubertin, "and was well content to do so on that morning." As they rode together in a carriage to the fatal spot, "he remarked upon the view of the city, and said, 'What a beautiful view, and what a beautiful day to die on!'"

Here it may be well to call attention to an inaccurate statement in Sir Theodore Martin's fourth volume of his 'Life of the Prince Consort' in regard to this event. He represents Maximilian as, "just before he was shot," giving a message for his wife to the attending priest. But Mr. Aubertin makes it evident that he died in the firm belief in his wife's death. The false report which was brought to him, but three or four days before his execution, by Mejia, the Indian general who suffered with him, was "generally supposed to have been invented by Mejia to pacify the mind of the Emperor, who had been more afflicted by the idea of leaving her in misery than by any other consideration."

Though our author stayed in Mexico but nine weeks, he made such good use of his time and opportunities, and he was so thoroughly prepared by his life in Brazil to understand and appreciate what he saw, that his book is more than a mere sketch. To all appearances it is, as far as it goes, a faithful picture of the present condition and prospects of the country.

Essays at Home and Elsewhere. By E. S. Nadal. London and New York: Macmillan & Co. 1882.

THESE essays are partly critical and partly social; and, at the risk of using a very hackneyed phrase, we can think of no word that so aptly characterizes their general drift as "suggestive." Mr. Nadal's English is simple and straightforward, and no one can read the whole book without meeting with a good many trains of thought or suggestions that will make him feel that his time has not been thrown away. In the essay on Byron, which is the best in the book, Mr. Nadal has some interesting remarks on the fighting passion as it appears in Byron's poems. Byron's combatants, as he says, fight like tigers; they are filled with a deadly enmity. Sir Walter Scott's are apt to display a magnanimity in battle which reminds us of "highly honorable head-boys at Rugby." On the other hand, "the combatants of Byron have for one another a really feline hate. His imagination carries us into the midst of dark and implacable passions. He describes a character of man to whom an insult incompletely avenged is as irremediable a calamity as the loss of her virtue to a woman." Mr. Nadal adds:

"Such states of mind, although they exist, are very much the exception at present. It is, indeed, surprising, considering what the possibilities of those passions are, and their history, to see how little force they have in most people's minds. It is evident that they are gradually, but surely, growing weaker. This is being accomplished by the delicate and universal influence of democracy upon the individual character. This power works not through the moral sense of men, but through their self-interest. It does not repress the thought, but represses its manifestation. People cannot go on nursing thoughts which they are not permitted to express or exercise. Hence the passions themselves dwindle like those organs of the animal creation which disappear by disuse."

The idea which lies at the bottom of these passages, that the passions of hate and revenge in modern life are not what they once were, has no doubt a good deal of truth in it; and their intensity in Byron's poetry was the intensity of the antique, anti-democratic world—the world in which love-making and war were felt to be the only proper occupation for a gentleman. But the connection between the change and democracy Mr. Nadal does not make at all clear. It is probably the commercial spirit that every year tends to produce a type of character in which hate plays a very unimportant part. Displays of hate and anger, moral considerations apart, are discountenanced universally in this country, not because it is governed by universal suffrage, but because the country is devoted to business; and nothing is more dangerous to success in business than a sensitive and uncertain temper, or indulgence in feelings of animosity, as such. In a commercial country the man will get on best who is most universally good-natured and considerate of the feelings of others, and who allows his intellect to be least clouded by passion of any kind. A man who is frequently losing his temper, or easily insulted, is at a disadvantage in the struggle for opportunities of profit. Consequently, most Americans are accustomed to look upon temper of any kind as a vice, and even to confound a perfectly natural and just indignation with it. In a country in which most people are always trying to sell each other something, bad temper interferes with success in life; and, on the principle of natural selection, those will succeed best who have the best tempers, and thus amiability will itself become, as it has become in the United States, a marked national trait, and the Byronic passions will only be found among the uncommercial classes—the cutthroats and ruffians who figure in the police reports.

Mr. Nadal makes up for his occasional suggestiveness by writing a vast amount of rubbish, which there can be no excuse for printing unless the fact that the author really does not know the difference between the important and the trivial in literature. He has an essay on Artemus Ward which would probably have made that eminent showman laugh loudly if he could have read it. Mr. Browne was, after all, hardly a serious literary character, and an analysis of the sources and meaning of his humor is a task full of peril.

A Comprehensive Commentary on the Qurán: Comprising Sale's Translation and Preliminary Discourse, with Additional Notes and Emendations. By the Rev. E. M. Wherry, M.A. Vol. I. Boston: Houghton, Mifflin & Co. 1882.

WE have here the twenty-ninth volume of "The English and Foreign Philosophical Library," the constituent members of which have been of various degrees of excellence, and, taken altogether, rather a motley assemblage. For a moment our temptation is to say that the novelty of spelling which substitutes Qurán for Koran, is the only new thing about the book. Of 390 pages, more than 280 are taken up with Sale's preliminary discourse on the Koran, and much of the remainder of the book with his translation. This appeared in 1734, and has stood the winnowing of time remarkably well. The "Preliminary Discourse" also has suffered less than almost any other study in comparative religion of an equal age. Sale brought to his work of translation and exposition a remarkable sobriety and diligence, and a spirit quite uncommon 150 years ago. Luther's "Oh, fie, for shame, you horrid devil—you damned Mahomet!" was not then two centuries old, this being a note on a translation of the Koran, a miserable one in Latin, that he came upon in 1540. From Luther to Sale there was but little change, if any. The talk of Behemoths, and beasts, and korahs, and six hundred and sixty-sixes, and the Little Horn of Daniel, had shown hardly any sign of improvement when Sale attained by a magnificent leap to well-nigh the appreciation of Goethe and Carlyle. Mohammed was at least for him no miserable impostor, but a sincere reformer of religion, deserving of a name high and revered among the great religious founders

of the world. At points where the "Preliminary Discourse" of Sale has obviously been corrected by more recent studies Mr. Wherry has made the necessary corrections.

The translation of Sale, as well as his preliminary discourse, was a remarkable production for the time when it appeared, quite worthy of the generous commendation of Voltaire, though his opinion in the premises was of small account. Its arrangement of the Suras is the orthodox arrangement, whereas the recent translation of Rodwell attempts a chronological order. Both arrangements have their advantages. Mr. Wherry, preparing a commentary for the use of the missionaries, naturally preferred the orthodox arrangement. Rodwell's translation is more exact and has more of verbal felicity, but Mr. Wherry has used it so freely in checking Sale that not much is lost upon this side. For a translation that gives a better idea than either Sale's or Rodwell's of the Koran's real force and beauty we must betake ourselves to Lane's 'Selections.'

Mr. Wherry is a Christian missionary, and has worked with missionary aims, but he is one of the broader-minded of his class. He has been at considerable pains to draw out the testimony of the Koran to the genuineness and credibility of the Christian Scriptures; to insist upon the fabricated character of the Koran in contrast with its claim to supernatural inspiration; to indicate Mohammed's denial of the doctrines of the "Former Scriptures" while attesting their divinity; and to reprobate his appeals to Heaven in sanction of his personal immorality. There is something over "vigorous and rigorous" in Mr. Wherry's putting of these things; but, on the other hand, he is careful to correct many of the grosser misrepresentations and misapprehensions of the Christian world concerning Mohammed and his religion. Many of his own notes are a real addition to those of Sale, but the value of his commentary depends less on these than on his citations from the best Moslem commentators and the ablest European scholars in elucidation of the text. The notes from Muir and Nöldeke are always able and instructive. Mr. R. Bosworth Smith's 'Mohammed and Mohammedanism' is quoted in a manner more respectful than its trivial and bumptious character would seem to warrant. Another volume will be necessary for the completion of the translation and the commentary.

William Penn (1644–1718). By R. J. Burdette. [Lives of American Worthies.] Henry Holt & Co. 1882.

THE work before us marks a very decided departure from the ordinary methods of biographical and historical criticism. It is a difficult task for any but the most rigidly conscientious writer to execute a comic biography which shall do adequate justice to the merits of the character he designs to present, so easy is it, under the disguise of a joke, to portray the most disinterested and high-minded actions in such a manner as sorely to mislead the uninformed. Mr. Burdette appears to have been particularly sedulous to avoid this danger. He has endeavored, as far as possible, to be perfectly fair, and frequently at the close of some humorous or exaggerated account of events he has a serious paragraph by way of rectification. His closing eulogy of Penn is flattering enough to satisfy the great Quaker's most ardent admirer:

"In an age of bitter persecution and unbridled wickedness he never wronged his conscience. A favored member of a court where statesmanship was intrigue and trickery, where the highest morality was corruption, and whose austerity was venality, he never stained his hands with a bribe. Living under a Government at war with the people, and educated in a school that taught the doctrine of passive obedience, his life-long dream was of popular government, of a state where the people ruled."

But Mr. Burdette has by no means wholly escaped the quicksands of comic biography. The effort to present in a humorous guise Penn's final reception of his religious faith, his diplomatic mission to Holland, his prolonged residence in England, his assumed tenacity of self-interest, and his anxiety for "quit rents," has resulted, as such efforts are very likely to result, in somewhat distorting the real facts of the case. At one place the author says of Penn: "His faculty of self-interest was well developed," but forgets at the same time to give due prominence to the fact that Penn refused the offer of the Assembly of 1683 to grant him "an impost on certain imports and exports"; and also that, in after-life, when oppressed with financial burdens and despoiled of many of his rights by his delinquent colonists, he steadfastly declined to consider his manifest advantage, by selling the province to the Crown, without the strongest guarantees that the liberties he had granted to the people of Pennsylvania should be preserved intact. Our author also attributes the attitude of the early Pennsylvanians regarding "quit-rents" to the fact that their proprietor stood to them in the relation of a feudal lord. It is possible that such was the true cause, but it seems hardly likely when we inquire what ground they had for withholding supplies, and allowing the Proprietary to maintain, at his private expense, the Government by which they profited so much. The early settlers not only never paid Penn his "quit-rents," but the Assembly only voted supplies on one or two occasions. They even refused a grant to defray his expenses to England, when he was obliged to return to the mother country to represent their interests before the House of Lords. Logan's view of the case, that their conduct was due to an excess of freedom, is the more probable one. In a letter to Penn, the Secretary says: "There are few that think it any sin to haul what they can from thee."

Mr. Burdette has, upon the whole, displayed fidelity to historical facts. He has drawn his materials largely from the works of Dixon and Janney. His aim has not been to add anything substantially new to our knowledge of the subject, but simply to set forth in a comical way the somewhat prosaic items of history. His sketch of the pamphleteering energies of religious controversialists of the seventeenth century is very amusing.

American Game-Bird Shooting. By John Mortimer Murphy. Illustrated. Orange Judd Co.

A PARAGRAPH of the publishers' circular which accompanies Mr. Murphy's work claims preëminence for him as a sportsman on the following grounds: "Having served in the artillery, when only a mere lad, during the War, and subsequently acted as Assistant Adjutant-General of the State of Oregon, he has a complete knowledge of ordnance, and this and his varied experiences in field sports have made him a clever 'all-round sportsman.'" It would be most desirable if the majority of those who use a sporting gun were made to go through a similar course of training. What with the casualties of war and the dangers attendant on an Assistant Adjutant-Generalship of Oregon and the care of its ordnance, the chances of the survival of even an "all-round sportsman" would be pleasantly slim. Mr. Murphy has not emerged from so bitter an apprenticeship entirely unscathed, as is demonstrated by the fact that he has written a book on 'American Game-Bird Shooting.'

It is but just to concede that to one class of readers this book cannot fail to prove attractive. Those youths about to become the possessors of, or who already own, their first shotgun, will accord it a warm and gracious welcome. To them the facts the author gives will prove both instructive and entertaining; to the sportsman he imparts no information which has not been already given much more agreeably over and over again. What the effect of Mr. Murphy's success as an author will be, in the way of encouragement, upon his successors to the Assistant Adjutant-Generalship of Oregon and the "all-round sportsmen" of that State, is a question to which the boldest man will shrink from hazarding a reply.

Essays on the Floating-Matter of the Air, in relation to Putrefaction and Infection. By John Tyndall, F.R.S. D. Appleton & Co. 1882.

As all the essays contained in this volume have already been before the public for several years, it is only necessary to call attention to their publication in book form. No better book can be placed in the hands of a student about to engage in the study of the question of spontaneous generation and the germ theory of disease. The care and ingenuity displayed in peforming the experiments, and the power of close reasoning shown in the discussion of their results, entitle the book to be regarded as a model of its class. Now that the recent researches of Koch upon tuberculosis have justified the hope that we are upon the threshold of important discoveries in regard to the connection of low organisms with the production of disease, it is of vital importance that the minds of all who are engaged in the research should be imbued with the spirit of fairness and the love of truth which are so conspicuous in the writings of Dr. Tyndall.

BOOKS OF THE WEEK.

Brockhaus' Conversations-Lexikon. 13th ed. Parts 28–30. New York: L. W. Schmidt.
Collot's French Dialogues and Phrases.—Interlinear French Reader.—French Anecdotes and Questions.—Levizac's French Grammar and Exercises.—Pronouncing French Reader. Five volumes. Philadelphia: T. Ellwood Zell.

Zola, E. The Mysteries of Marseilles. Philadelphia: T. B. Peterson & Bros. 75 cents.

"Kinley Hollow

is quite above the line of the ordinary novel. To the merits upon which we have specially remarked, the skilful and effective delineation of a past and gone society, the realization of old fashions of thought, and the faithful representation of types of character which had much to do with making New England what it is—it adds the further excellences of vivacious dialogue, which serves really to illustrate the speakers, and a strong feeling for the beauties of nature."—TRIBUNE.

The Nation.

NEW YORK, THURSDAY, AUGUST 24, 1882.

The Week.

THE seizure of the Suez Canal by Sir Garnet Wolseley has some lessons which may be of service to our Government in the matter of the proposed canal across the Isthmus of Panama. The British have taken possession of it from end to end, and are apparently going to use it as a base for their operations against Cairo. Now, the neutrality of the Canal has been guaranteed by the Sultan, within whose dominions, technically considered, it lies; but it turns out, as might have been expected, that his guarantee is not of the slightest value, inasmuch as he has no power to enforce it, were he never so desirous of doing so. He weighs in the matter about as much as M. de Lesseps, who is protesting valiantly. Whether a joint guarantee of the Powers would have been any more effective is very doubtful. It could only have been made effective by combined opposition to the British plans on the part of the naval Powers, but this it would have been almost impossible to bring about. Guarantees of neutrality, like other joint treaties, are apt to be enforced only when it suits everybody concerned. In any such combination Germany would have been a leading factor, and it suits Germany just now to let England have her way; and in the presence of this attitude of Bismarck the French and Italian fleets count for nothing. One thing the whole affair teaches is, in fact, that nothing but a very powerful fleet at each end of an interoceanic canal, or very powerful army along its banks, can guarantee its neutrality. Another is that threats of what will happen if it is violated are not likely to be much regarded by a belligerent. Belligerents seldom care much about remote consequences. They trust to luck, and think only of to-morrow or the day after. As a matter of fact, most of the bold, unscrupulous strokes in war succeed. By the time those who feel outraged by them get ready to chastise the insult, their anger has blown over. Almost the only exception to this rule in recent times has been the Russian invasion of Turkey in 1853. If we want to have a perfectly sure hold of the Panama Canal, we shall have to own it, and have enough force on the spot to repel any attempt to seize it, besides guaranteeing its neutrality on paper.

The plan of campaign in Egypt, as now revealed by Sir Garnet Wolseley, bids fair to justify the anticipation attributed to him that active operations will be over by September 15. It may be described very briefly by saying that Arabi had made all his preparations to resist an advance on Cairo, the capital, from Alexandria, and had constructed extensive and formidable earthworks for this purpose, and that the British are ignoring these altogether and have established a base substantially in his rear, which will compel him to abandon his present position and fight, if he fights at all, somewhere northeast of Cairo, probably at Tel-el-Kebir, on the railroad from Ismaïlia. The British are now in possession of the whole Canal, and have established themselves at Ismaïlia, the little half-way city created by the late Khedive, and there is evidently to be a rapid concentric advance both from that point and from Suez to Cairo, a distance of about sixty miles. There is no sign as yet of any such fighting power on the part of the Arabs as to lead us to expect that the march across the desert will be seriously impeded. Thus far there has been substantially no resistance to the invaders in the open, and but a feeble one behind the works. The defeat and slaughter of the intrenched garrison of Shaluff by a comparatively small party of British, shows that the Egyptian troops have not improved in quality since the Crimean war, or the Russo-Turkish war of 1876. In both of these they were practically worthless, even when supported by men of sterner stuff.

In the meantime the state of things in Turkey is very curious. Lord Dufferin has been trying to force the Sultan into signing a convention binding him to send troops to Egypt to aid in subduing Arabi Pasha, but placing them practically under Sir Garnet Wolseley's orders. This the Sultan and the Pashas cannot make up their minds to do, almost certainly for the very simple reason that their object in going to Egypt is not to fight, but to get at Arabi's treasury, which they believe to be pretty full, as the fellaheen are much better taxpayers than the Sultan's own subjects. The reason why the English want to keep the Turks under their own orders is that they know the Turkish fighting will not amount to anything, but wish to show the natives that the head of the Mohammedan world is on their side. There is, too, some very reasonable fear that if the Turks were allowed to wander about loose, they would, if they helped anybody, help the Egyptians. The Sultan is accordingly in a very perplexing situation, and apparently also in a very bad humor, for he has issued a decree forbidding the sale of mules to the British commissariat. This is not surprising, for the court is credibly reported to be in worse straits for money than ever before, so that a second stoppage of the palace mutton is not unlikely. The Galata bankers will lend no more at any rate of interest, and the London *Truth* has an amusing story, which is not improbable, that one of the officers has been selling some of the imperial furniture to raise the wind for himself. In fact, it may be said that the treatment of this crew of swindling debauchees and eunuchs as a regular government, to be negotiated with and deferred to, is one of the oddest phenomena in modern history, when we consider that it is the result of a sort of concert between the leading civilized Powers of the world.

Mr. Gustav Schwab, while giving his views on the subject of the wool trade before the Tariff Commission, said, in the innocence of his heart, that if he were to follow his own convictions, he would make an argument in favor of free wool, but that he supposed it would not be acceptable to the Commission. This remark was made in the course of a colloquy with Mr. A. M. Garland, the President of the National Wool-Growers' Association, who enjoys a place on the Commission. The National Wool-Growers' Association is an organization whose chief business is to look after the wool tariff. Probably Mr. Schwab was aware of this fact, and hastily drew the inference that an argument for free wool would be out of place then and there. Mr. Kenner, of Louisiana, was so impressed with Mr. Schwab's frankness that he insisted upon knowing how the latter came to imagine that an argument for free wool would not be acceptable to the Commission. Mr. Schwab replied that he had learned at Washington city that the wool-growers had great influence in legislation, and that this fact was uppermost in his mind when he made the observation which excited Mr. Kenner's curiosity. No allusion to Mr. Kenner's colleague, Mr. Garland, was intended, or to any interests he might be supposed to represent. Mr. Schwab's politeness was as graceful as his former frankness had been charming. We trust that Mr. Kenner was soothed by it.

Before he made the formal statement of his views on wool duties, Mr. Schwab had had an informal conversation on the subject both with Mr. Garland and with Tariff Commissioner Hayes, a member of the same National Wool-Growers' Association and a representative also of the wool manufacturers. It might be hastily assumed that these particular wool-growers were associated solely for the purpose of promoting the raising and shearing of sheep, but that would be a great mistake. The chief object of the society is to maintain a satisfactory protective duty on imported wool, and the associates are far more concerned about members of Congress than about sheep. Mr. Hayes has made himself so useful in securing these high duties, in connection with high duties on manufactured wool, that he would be entitled to life-membership of the Association even if he should take no further interest in the wool question. A further and proper recognition of these services is his selection for President of the Tariff Commission. Mr. Schwab might be excused for taking for granted that these eminent wool-growers were not friendly to free wool. To assume that, after so long and so openly maintaining the patriotic and commercial duty of putting a high tariff on wool, they would prove false to their convictions and betray the trust of the National Association, simply because they had been appointed members of a commission to revise the tariff laws, would be an act of discourtesy of which we are sure Mr. Schwab is altogether incapable. But if there had been any doubt as to their position, these celebrated wool growers removed it in the course of the conversation, when Mr. Garland and Mr. Hayes both spoke of the abolition of the duty "as an

impracticable measure, which, of course, Mr. Schwab would not even mention." So when he addressed the Commission, instead of raising the unworthy imputation that an honorable wool-grower could undergo an economic transformation and abandon the opinions of a lifetime upon the calling of the Commission to order, Mr. Schwab politely assumed that these Commissioners believed then what they believed ten minutes before, and said that, while he was himself for free wool, he did not think it worth while to discuss the subject from that point of view.

In an interview reported on Thursday Representative Carlisle, of Kentucky, said that the meetings of the Tariff Commission "reminded him very much of the sessions of the Committee of Ways and Means." That Committee listens regularly to the "selfishly interested" people who want "the tariff adjusted to suit their own objects and views." This is what the Tariff Commission is doing. Mr. Carlisle predicted that the Commission would simply "send to Congress three or four thousand printed pages of testimony which not a half-dozen members would read." This is just what the Committee of Ways and Means would do if it should be directed to sit during the recess. The testimony will be almost wholly of the selfishly-interested kind which Mr. Carlisle describes. While the various witnesses will have particular interests to serve, there will be substantial unanimity of protest against a reduction of duties If it be asked why so much testimony of this sort will be taken, the answer is that it is generally understood that the Commission was organized for the very purpose of gathering such evidence. It is equally well understood that evidence of a different kind is not wanted. Neither Mr. Kenner nor any other rational man can suppose for a moment that the Commission was formed with a view to free wool or free anything else. If the design had been to reduce duties and enlarge the free list, a majority of the Commission would have been composed of men inclined to such a policy; or at least half of it would have been so made up. Certainly that policy would not have been altogether denied representation.

At Saratoga on Thursday Mr. Bonney, of Chicago, gave the Bankers' Convention some account of what is known as the "equity" bankruptcy scheme, reported favorably in the Senate at the last session. The scheme is simply to put the whole business of winding up bankrupt estates in the hands of the United States courts, leaving them, as in all other matters over which they have jurisdiction, to make their own rules of practice and procedure. This plan has never been tried, certainly in this country, where we have always had an elaborate system provided in the Bankrupt Act itself, with a special set of officials, minute regulations as to fees, etc. The act, when one is in force, is always amended every year, so that the procedure never becomes entirely stable. Now, this instability would undoubtedly be avoided by turning the whole matter over to the courts; and, taking the United States courts as they are, and Congress as it is, there can be little doubt that bankrupts and creditors would be better satisfied in the long run with having the matter wholly regulated by the judges in each circuit than by members of Congress. At any rate, the other plan, whenever it has been tried, has failed, while this plan may work well. If it does not, Congress can always interfere, and pass an old-fashioned bankrupt act, while, if it begins with one, it is not likely to go back to the equity plan; for, with an ordinary bankrupt act, owing to the number of officials interested in its being continued in force, the pressure against any change which would sweep them out of existence would be very great.

According to a cable despatch published the other day, Mr. Lowell has abandoned all hope of the international copyright negotiations coming to anything. Nobody is likely to be very much surprised at the news; it was anticipated by all who have followed the negotiations with any attention. The pirates have now a great opportunity, which they probably will not neglect, to reap a rich harvest, and we trust they will do so, for nothing but unlimited piracy will ever convince the great publishers that their attempts to establish international copyright on the basis of protection to the American book manufacturers will not work. The "Harper" treaty has broken down because the publishers have attempted, under pretence of making literary property sacred, to compel the foreign author to publish his book in America. Sooner or later the publishers will find out that they must all come into the market on equal terms, or else that they will be permanently driven out of the market by the pirates. The authors' best friend at present is the pirate, for it is the pirate alone who can bring the publishers to their senses. He has already half-converted most of the publishers, and in time he will make his work of regeneration complete.

The international law reformers have held their tenth annual conference of the International Congress at Liverpool, and discussed, among other things, the possibility of introducing an international form of bill of lading. It was voted, as the principle of liability, that the shipowner, whether of steam or sailing ship, should be liable for the faults of his servants in all matters relating to the ordinary course of the voyage, such as the stowage and right delivery of the cargo, and other matters of this kind; but, on the other hand, the shipowner should be exempt from liability for everything which comes under the head of "accidents of navigation," even though the loss from these may be indirectly attributable to some fault or neglect of the crew. This change seems very objectionable. It makes the responsibility of a carrier at sea different from that of a land-carrier, and without any good reason. A more sensible vote was that on the retention of the words "act of God," which some of the members objected to, incredible as it may seem, on the ground of "irreverence," and others because they were not sufficiently definite. The fact is that the term has acquired, by the decisions of judges, a perfectly definite legal meaning, and the sure way to unsettle it would be to introduce a new phrase, which would call for more interpretation. The Conference took this view, and the motion to strike out the words was lost by a vote of 27 to 12.

Another subject discussed by the Conference was that of marriage. The conclusion said to have been reached is, that the rule that a marriage valid in the place where contracted should be valid everywhere ought to be made international. This is the rule of our courts, but the fact that it is shows at once how very slight an improvement would be effected by making it universal. The rule has prevailed here since the settlement of the country, and yet there is no country in the world where divorce is so easy and the marriage tie so loose. In fact, in the modern world this country produces more marital troubles and complications than all the rest put together. Much of it comes from the ease with which foreign divorces are obtained on short residence, and this evil cannot be reduced by making a marriage good in one place good in all.

Another Southern "outrage" has been discovered in an election law passed by the Legislature of Louisiana. According to the account given by the alarmists, this statute provides that no ballot shall be received by the inspectors or counted by the canvassers "unless it is printed on paper furnished by the Secretary of State," and "so distinguished from all other paper as to be readily and unerringly identified." This is described as "the crowning manifestation" of "Democratic folly and recklessness and corruption," inasmuch as it leaves it for the Secretary of State "to say who shall cast a vote in Louisiana." We should be extremely reluctant to fix a limit to Democratic "folly and recklessness," in Louisiana or elsewhere; and certainly, if the Secretary of State should refuse to furnish the official paper to anybody but his friends, he might possibly prevent a good many people from voting. Any law may be abused, but it cannot be taken for granted that the officer entrusted with its execution will abuse it. Under such an assumption it might be necessary altogether to stop the making of laws. We suspect that this Louisiana law is very like the one under which elections are now held in the State of New York, and which prescribes the size of ballots, and the color and quality of paper on which, and the kind of type with which, they shall be printed. Some objection was made to this measure when it was proposed, but it is found to work well. Instead of promoting fraud, the intent and the effect are to prevent it. The tissue-ballot swindle is impossible under it, and as for the ready and unerring identification on which stress is laid by the critics of the Louisiana law, the truth is that, as the outside of all ballots of all parties will be alike, it will really be impossible to identify them for the purpose of intimidation or other unlawful object.

The principal financial event of the week was the advance in the posted discount rate of the Bank of England to four per cent. from three per cent. Although the reserve of the

Bank is not high, yet nothing in the present situation demanded the advance. It was therefore construed as a premonition or notice to the commercial world, and particularly to this country, that an effort will be made to prevent gold leaving London during the remainder of the year. It is now tolerably clear that England will need more of our breadstuffs and cotton than last year, and there was a good prospect that we should draw gold from her. The importance of the action of the Bank is that it weakens this expectation. Here the Treasury continues to take in more money than it pays out, and some currency is going to the interior from the Atlantic cities. The surplus reserve of the New York banks was reduced to less than $2,000,000, and is falling. The rate for call loans did not, however, fairly advance above 4@4½ per cent. Foreign exchange advanced for short-date remittances. At the Stock Exchange the tendency of prices for railroad stocks was, with few exceptions, to lower figures, and the decline ranged from ½ to 4¼ points. The general trade of the country is looking well and promises to be extraordinarily good during the autumn. The railroad tonnage does not yet show an increase, for the reason that the movement of the new crops has not yet become important.

Mr. James W. Fitch, of Ohio, has written a letter to the New Haven *Palladium* to protest against the "Walter Malley March" being played on the green, and against the Walter Malley jury having picnics in honor of saving Blanche and the Malley boys from the gallows. The *Palladium* thinks that "disgrace enough" has been brought upon New Haven by the trial, and insists that the "Walter Malley March" must not be played any more. The *Palladium* and Mr. Fitch do not analyze the reasons for objecting to such performances, but if they did, they would no doubt say that the whole Malley trial was a very disgusting and repulsive inquiry; that "the boys" are cold-blooded young villains, apparently destitute of shame; that their accomplice, Blanche, is an outcast of a very depraved type; that much of the testimony in the case was so disgusting as to be unfit for publication; and that consequently the whole affair is one which everybody in New Haven dislikes to hear mentioned or alluded to. The leader of the American band who plays the "Walter Malley March," however, draws exactly the opposite conclusion—that these facts make the case replete with human interest, and that there is nothing that the citizen of New Haven likes better, when he takes his pleasure, than to listen to inspiriting strains which recall the villany of the boys, the vileness of Blanche, and the excitement produced by the mass of filth and perjury which made up the evidence in the case. If the leader of the band could be induced to give his views about the matter to the press, they would constitute a contribution to psychology and sociology of great interest.

Mr. Wilde's lecture at Long Beach on the useful and the beautiful is said to have caused a great deal of ill-feeling, and from the reports of the lecture which have appeared, this must have been due to his uncalled-for attack on the cast-iron stove. He denounced it in very plain language, and declared that it was the stove which had most shocked and disgusted him in America. He found himself able to stand the architecture of the houses, and the dressing, and the insincere furniture; but the stove, the cast-iron stove, with its meaningless shape and its ornamentation of cast-iron roses, he protested against. That this should have caused some feeling in the audience is only natural, considering the important part that the stove plays in American life. The iron stove is a great national institution, and if the public is to be weaned from it, it should be gently and gradually, and not by violent denunciation and abuse. Other countries get along without stoves; but then they get along without a great many things that we have. The French, for instance, although their attention has often been called to the matter, get along without any word for "home" in their language, but we cannot. We are accustomed to the stove. We have it in the country store, and round it cluster a thousand interesting political and religious associations. The store "base-burner" has been in every town and village of the United States the nursery of political agitation and political harmony. Then there is the "air-tight" stove, at the glowing sides of which the solitary village Tweed, sent hungry to bed, warms himself while maturing schemes of adult pillage and spoliation. Then there is the railroad stove, which has slain its thousands, and tens of thousands, and the gas-stove, which has rendered the atmosphere hideous in many a happy American home. We may suffer from the stove, but our sufferings endear it to us, and therefore the reformer should rouse us from our dream gently.

It seems to be time that the somewhat ridiculous controversy which has been raging in England over the *Nation's* statement that not over "one man in one hundred thousand," in this community, "had the manners or cultivation of a gentleman, changed his shirt more than once a week, or ate with his fork," should cease. Mr. Matthew Arnold seized on it as a bit of statistics illustrating the low condition of American manners, in an article on American Society, and ever since then it has formed a subject of heated discussion between the friends and enemies of American institutions, which is continued in the last number of the *Spectator*. The article in which the shirt-and-fork illustration appeared in our columns was suggested by a protest of the *Pall Mall Gazette* against the luxurious habits and ideas in which boys who have no pecuniary expectations, and will have to earn their own bread, are brought up in English schools and colleges. We said this protest was as applicable to this country as to England; that here, too, young men in college get into wealthy men's way of looking at life, although, after leaving college, they will have to work for a living in a society which is, as to shirts and forks, in the condition we described, and to which they will have to adapt themselves. It was no more a statistical statement than that old one about the knowledge possessed by "every school-boy," and the crushing calculation which some of its critics have made, that this would leave only five hundred clean-shirted and fork-using men in the United States, is about as useful as the production of several school-boys ignorant of what "every school-boy knows."

The British Parliament has adjourned until the 24th of October, after a lively but entirely inconclusive debate on the arrest of Mr. Gray. In this Mr. Gladstone plainly indicated that he regarded the action of Mr. Justice Lawson in imprisoning Mr. Gray as oppressive; but very truly said that he knew of no way in which even a Parliamentary committee could secure his release. If, as we suppose, the punishment has nothing to do with coercion, but is simply an excessive punishment for a common-law contempt of court, there is nothing short of an address to the Crown for the removal of the Judge which would be of any avail. Mr. Gladstone went so far as to suggest such a course, amid loud cheers from the Irish members. Nothing could better show the embarrassing position in which the hasty action of the Judge places the Government than the debate which followed. Mr. Sexton insisted that he ought to have allowed Mr. Gray to make a defence, and read telegrams relating to one of the convictions commented upon by Mr. Gray's newspaper (the Hynes case), reciting affidavits declaring several of the jurymen to have been drunk, and repeating the accusations of jury-packing in Ireland. Mr. Gray of course ought not to have had a severe and unusual punishment inflicted upon him without being given leave to show that there was some basis of fact for his publication, and obviously it would be a gross outrage to carry out the sentence on Hynes if his conviction could be proved to have been procured from a drunken jury.

When these facts came out, Mr. Johnson, Attorney-General for Ireland, was obliged to enter into a defence of the composition of Irish juries, and to promise that Earl Spencer should investigate the charge with regard to the Hynes jury. Thus, while Mr. Gray is being locked up in Ireland for making the charge, the Attorney-General is promising in Parliament to have it at once investigated—a state of affairs only calculated to bring into greater contempt the administration of the law in Ireland. The publicity of the debate defeats any object that might be gained by the imprisonment itself. On this account the adjournment of Parliament will strengthen Mr. Gladstone's hands for the time being. Whatever is done in Ireland by hasty judges or over-zealous prosecuting officers—and probably many oppressive things will be done—the Government will escape the dangerous attacks of the Irish party in the House. The adjournment will also be an advantage in the Egyptian campaign, for an atmosphere of Parliamentary debate and criticism at home is not that in which any Government likes to carry on a foreign war. If, as now seems probable, the Egyptian campaign proves short and decisive, the prestige of Mr. Gladstone—for he is the Government—will be greatly increased when Parliament reconvenes.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, August 16, to TUESDAY, August 22, 1882, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR remained in this city until Tuesday, when he went to Newport. A Cabinet meeting was held at his house on Lexington Avenue on Monday afternoon. Nothing of particular public interest was discussed.

Considerable excitement has been caused in political circles in this State by a recent editorial article in the Albany *Evening Journal*, charging Mr. Conkling, in the interest of Jay Gould, with having endeavored to influence Governor Cornell's action on the Elevated Railway and Pacific Mail Steamship Tax Bills, offering him his (Conkling's) support in the Governorship contest, and also an opportunity to profit by the probable rise of the stocks. The article is supposed to have been "inspired" by Governor Cornell, and it will have a great influence on the coming political campaign for the Governorship in this State.

Mr. Jay Gould added his mite to the Conkling-Cornell controversy by asserting, in an interview published in a Sunday newspaper, that Governor Cornell promised to sign the Elevated Railroad Tax Bill, but that, after the bill had been passed, he discovered some constitutional objections, and expressed a wish that Mr. Conkling should be employed by the company to give a legal opinion on them. Mr. Conkling was employed, and the Governor vetoed the bill. Mr. Gould also asserts that Governor Cornell got up a blind pool in American District Telegraph stock, with his assistance and that of Mr. Russell Sage and Sidney Dillon; that after inducing his friends to buy stock he "went the other way" and made a large sum of money by selling. Governor Cornell denies that he promised to sign the Tax Bill, but makes no explanation in regard to the blind pool. The Albany *Journal*, in an editorial article on Monday, reiterated its charges, and also asserted that Mr. Cornell was promised Mr. Conkling's support, and that of all the Gould newspapers, if he would make a favorable decision on the Tax Bill.

The conventions of the First, Second, and Third Assembly Districts of Albany County, N. Y., were held on Tuesday, to select delegates to the Republican State Convention. Pronounced anti-Cornell delegates were elected throughout. In the Second District a resolution to endorse Governor Cornell's administration was overwhelmingly voted down. Secretary Folger was a favorite candidate among the politicians at the conventions.

Senator Mahone, of Virginia, is seriously troubled by the open revolt of Congressman Fulkerson, of the Ninth District, who has broken loose from the coalition, and declares himself an Independent candidate for Congress.

The Ohio Democrats, on Wednesday, nominated F. D. Walker for Secretary of State, John Foley for Treasurer, and minor State officers. The platform demands civil-service reform and a reduction of taxation in national affairs. In State affairs the Democrats declare that they will use all legal means to eliminate the prohibition amendment from the Constitution. They demand State regulation of railway freight charges.

On Friday the Greenbackers of Massachusetts nominated General Benjamin F. Butler for Governor, George Dutton, of Springfield, for Lieutenant-Governor, and other minor State officers. The platform demands a check upon the power of wealth, and a system that will secure to the laborer the profits of his toil; that the national debt shall be paid as rapidly as the revenues will allow; that the general Government shall coin and issue all money, whether metallic or paper, make it a full legal tender for all debts, without exception, and receive it in payment of all taxes, and that it shall abolish the national banks as banks of issue. A board of arbitration for the settlement of labor troubles in the State is recommended, and Minister Lowell's course at the Court of St. James is condemned.

The State Committee of the Anti-Monopoly party of New York held a meeting in this city on Wednesday and decided to hold their State Convention on September 13, at Saratoga.

Governor Foster, of Ohio, made a speech before a Republican County Convention on Wednesday, in which he denounced the whiskey dealers' rebellion in that State in strong terms.

At a meeting of the Western Distillers' Association in Chicago, on Thursday, resolutions were passed favoring the enforcement of the Sunday laws, and asking no special privilege for their business in that respect. They approve a well-digested license law, with the fee placed high enough to yield a large revenue and reduce the number of drinking-places. They oppose arraying themselves against either of the great political parties.

Before the Tariff Commission, during the week, pleas have been heard from the representatives of a great number of industries, most of them in favor of increased duties. A notable exception was Mr. Gustav Schwab, of this city, who remarked that he would advocate free wool, except that such an argument would not be acceptable to the Commission. This remark was resented by Commissioner Kenner, who said that they were willing to hear free-trade as well as protection arguments. William S. Rice, of New York, on Thursday, urged the removal of the ten per cent. duty on hay. A programme has been arranged by the Commission to hold meetings in a number of the prominent cities during the next few weeks.

The Bankers' Association opened its annual Convention at Saratoga on Wednesday with a large attendance from all sections of the country. The President, Mr. George S. Coe, made an opening address, in which he discussed the question of bi-metallism, the functions of a bank, and the best basis of a bank currency. A valuable paper was read by Professor Atwater, of Princeton College, on the means of securing a safe, elastic currency when Government bonds are no longer obtainable. Mr. W. H. Perkins, cashier of a bank in Jackson, Miss., read a paper, on Thursday, on the industrial growth of that State. The Convention adjourned on Thursday, after reëlecting Mr. George S. Coe President.

The American Bar Association, at its meeting on August 11, adopted the majority report of the Select Committee on a bill for relief of the Supreme Court of the United States, which approved the general scheme of the Davis bill, passed by the Senate on May 12, establishing an Intermediate Court of Appeal. It was erroneously asserted in the Summary of last week that Mr. Evarts approved of the plan adopted. On the contrary, Mr. Evarts favored the minority report, for a division of the Supreme Court into three Committees.

Arguments in the Star-route trial, at Washington, proceeded slowly according to the programme announced last week. Mr. Carpenter spoke for the defence on Wednesday, concluding his argument, and Mr. Chandler, counsel for Brady, followed. Colonel Bliss began his argument for the prosecution on Thursday afternoon, and finished on Friday. Mr. Williams and Colonel Totten spoke for the defence on Monday, the latter gentleman being succeeded by Mr. McSweeny on Tuesday.

Several more letters from ex-Senator Dorsey to the late President Garfield have been published. They are of a similar impertinent character with the first one, and are full of advice to him to give ample acknowledgment to the Stalwarts in all his nominations.

It is estimated that the Government receipts for the present fiscal year will amount to $450,000,000.

The State Department, at Washington, is informed of the release of Messrs. McSweeny and Slattery, two of the alleged American "suspects" who have been for some time imprisoned in Ireland.

Secretary Lincoln, of the War Department, on Thursday appointed 200 new clerks for the pension service.

The White House, at Washington, is being thoroughly renovated. The sewerage and ventilation are undergoing improvement.

Secretary Chandler, of the Navy, is making a tour of inspection of the Navy-yards, in the United States steamer *Tallapoosa*. He visited Wilmington, Del., on Wednesday, and inspected the unfinished monitor, *Amphitrite*.

Several Government expeditions, to observe the transit of Venus, in December, left this country for the Southern Hemisphere during the week.

Crop reports from the West continue to be favorable in the main. Oats are turning out well, but the crop will not meet the large estimates of a fortnight ago. The corn has been somewhat injured by cool weather. In New York State an increased yield is promised in all crops, with the exception of corn.

The Wampanoag Mills at Fall River, Mass., were compelled to shut down on Friday, on account of the strike of the spinners. The strike is extending among the driver-boys of the Pennsylvania coal mines.

The strike at the Cohoes, N. Y., mills has virtually ended in favor of the mill-owners.

Serious trouble was apprehended at the Pine Ridge Agency of the Sioux Indians last week. Troops were ordered to the seat of the difficulty. The trouble arose from dissatisfaction of Red Cloud with Agent McGillicuddy. The sentiment of the greater part of the tribe was against him, and he was forced to submit on Monday. He is now on parole, and the chiefs and police of the tribe are responsible for his conduct.

From Choctaw County, Alabama, it is reported that a bundle of papers recently found disclosed a plot on the part of negroes to kill all the white people in the county on a certain day, when a majority would be congregated at a camp-meeting. A meeting of the citizens of the county was held on Saturday last, at which 700 were present, 150 of them being negroes. After hearing the papers read it was decided by an almost unanimous vote that one of the negro leaders, Jack Turner, was a dangerous character, and that the public demanded his immediate death. He was accordingly hanged that afternoon. Six other negroes are in jail awaiting further developments.

Mr. Herbert Spencer arrived in this city, from England, on Monday afternoon. He is the guest of Prof. E. L. Youmans. His visit to this country is solely for his health. He will visit Chicago, St. Louis, Boston, and parts of Canada.

Mr. Frederic de Peyster, LL.D., one of the oldest and best-known citizens of New York, died at Tivoli, Dutchess Co., on Thursday night. He was eighty-six years of age. He was one of the oldest members of the Historical Society, and was the author of a number of essays on historical and antiquarian subjects. By profession he was a lawyer.

Senator Benjamin Harvey Hill, of Georgia, died, at his home in Atlanta, on Wednesday morning, surrounded by the members of his family. His illness began more than a year ago, but was not considered serious at first. He submitted to several operations upon his tongue, in Philadelphia, last fall, and a cure was predicted. But the cancer could not be conquered and finally resulted in his death. He was fifty-nine years of age. As a lawyer he was very successful; as an orator he was fervent and effective; as a Senator he was pugnacious, often inconsistent, but always sincere. At his home he was admired and respected for his manliness. His term in the Senate would have expired next March. During the war he was a member of the Confederate Senate. He was buried on Saturday with great ceremonies.

FOREIGN.

After the arrival of Sir Garnet Wolseley, the British commander, at Alexandria, on August 15, military affairs in Egypt became more interesting. On Wednesday, General Wolseley, with the authority of the Khedive, issued a proclamation to the people of Egypt representing that the sole object of the British was to restore the authority of the Khedive, and that all peaceful inhabitants would be kindly treated. He then held a conference with Admiral Seymour and all the generals, in order to consult in regard to future action. An incident of the day was an encounter between a British mounted patrol and a party of 500 Bedouins, near Ramleh. Five of the latter were killed.

On Thursday it was reported that General Wolseley had decided upon an early attack on the Abukir forts. Various reports were published as to his plans for the attack, but nothing definite was known. On Friday a number of the troops began to embark on the fleet in the harbor of Alexandria, and by evening the whole expedition was on board ready to start. At 1:15 P. M. on Saturday the fleet steamed out of the harbor to the eastward. In a few hours fighting was begun by the troops, along the Mahmudieh Canal, under the command of General Wood. He pushed a sharp reconnoissance of seven companies within 700 yards of the earthworks of Arabi, near Ramleh. A close examination of the works reveals that they are excellent, and that there are deep cuttings in advance of the entrenchments. It was supposed that, simultaneously with the fighting on land, the fleet would bombard the Abukir forts. The vessels arrived there on Saturday afternoon, but at half-past ten at night quietly steamed to the eastward. On Sunday morning they unexpectedly arrived at Port Saïd, about three o'clock, and occupied it with 600 men. The Government of the Khedive was reinstated, and the Canal closed to merchant vessels. It then became evident that General Wolseley had made a very important movement, which the rumored bombardment of Abukir had effectually covered. Not even the brigade commanders were aware of the plan until they opened their sealed orders on Sunday morning. The occupation of the Canal occasioned a warm protest from M. de Lesseps. The French Government, on Monday, sent him an official communication inviting him to employ prudence and circumspection in his language. On Monday the whole fleet entered the Canal and steamed away to Ismaïlia. The traffic on the Canal will only be temporarily suspended. On Monday evening there was a slight skirmish at Ismaïlia.

All the shops at Port Saïd were opened on Monday afternoon, and the Arabs began to fraternize with the Europeans. The outposts at Ramleh made a demonstration in the afternoon, and some artillery shots were exchanged. The English met with no loss. On Tuesday Arabi began to erect fresh earthworks at Ramleh, and to strengthen his position. It is reported that the Arab tribe holding the territory eastward of Bengazi, in Tripoli, is preparing to assist Arabi. A powerful chief, who is at the head of the national movement in Tripoli, is also reported to favor him.

The majority of the French newspapers comment unfavorably on the action of the British in occupying Suez.

Little has been accomplished by the Conference at Constantinople during the week. The draft of the military convention proposed by the Porte to England was as follows: "The Turkish Army undertakes the pacification of Egypt without foreign assistance, the British to remain in their present positions and not to participate in the operations. The Turks shall be allowed to use Alexandria as a base of operations, and the Turks and British both to withdraw after the pacification of the country." Lord Dufferin, the British Ambassador, rejected this and proposed in its stead that the Turks should not undertake operations without the previous consent of the British commander; that British officers should be attached to the Turkish headquarters; and that evacuation should be the subject of a special convention. Lord Dufferin was instructed, on Thursday, not to press the Porte for a reply concerning the military convention. A special Cabinet council was held in Constantinople on Saturday, and the Porte agreed to modify the Turkish draft of the convention by the following additions: that an English general shall be attached to the Turkish camp to facilitate communications between the Turks and the British; that the manœuvres of the troops shall be mutually carried out so as not to interfere with each other; that a date shall be fixed for the evacuation of Egypt by the English.

Lord Dufferin on Sunday assured Saïd Pasha that he was unable to accept the Turkish proposals, even in their new form. On Monday, Saïd promised Lord Dufferin that he would urge the Sultan to accept the British proposals.

Sympathy is growing in Constantinople with Arabi Pasha, and the Sultan is understood to be more averse than ever to the issuance of the proclamation against him.

The American Admiral Nicholson writes to the War Department denying that he warned the Egyptians, before the bombardment of Alexandria, that if they fired on any of his vessels, he would return the fire; he also denies that after the engagement he steamed around the English vessels and cheered them on their work.

Mr. Long, the American Consul, was attacked on Friday, inside the Gabarri Gate at Alexandria, by about forty natives. Some soldiers arrived and dispersed the crowd, and the ringleaders were arrested. The only cause for the attack known is that Mr. Long refused to be stopped when he was driving, and, urging on his horse, injured some of the party.

The report that the Ulemas of Egypt have deposed the Sultan is untrue. On the contrary, they sent congratulatory telegrams to him from all parts of Egypt, on the Feast of Bairam.

A deserter from Arabi's camp arrived at Alexandria on Thursday, and gave a graphic description of the misery prevailing there. The wounded are uncared for, and even shot to end their misery. Many Egyptians have been compelled against their will to fight.

The Khedive has summoned Riaz Pasha from France to join with Sherif Pasha in forming a combination Ministry under the Presidency of the Khedive. Omar Pasha Lufti will probably retain the post of Minister of War.

Great excitement was caused in Dublin on Wednesday, the day following the opening of the Exhibition, by the sentence of Mr. E. Dwyer Gray, member of Parliament and proprietor of the *Freeman's Journal*, to three months' imprisonment, and to pay a fine of $2,500, for contempt of court in publishing a letter of Mr. O'Brien, accusing the jury which recently convicted Francis Hynes of the murder of John Doloughty, of intoxication on the night previous to rendering the verdict, and in commenting thereon. Mr. Gray was then conveyed to Richmond prison. He was Lord Mayor of Dublin in 1880. At the presentation of the freedom of Dublin to Messrs. Parnell and Dillon, on Wednesday, great excitement was shown over the arrest. Mr. Parnell made a speech, advising calmness, and a proclamation was issued, signed by the Lord Mayor and Messrs. Parnell, Dillon, and Davitt, urging the necessity of temperance in the emergency.

In the House of Commons on Thursday, a letter was read by the Speaker, announcing the committal of Mr. Gray. Mr. Gladstone asserted that precedents in similar cases show that the appointment of a committee is the proper course. At the present period of the session, however, it was too late to secure the appointment of a representative committee. He did not, moreover, know any way in which the committee could release Mr. Gray if they wished to do so. He therefore made a purely formal motion that the letter of Judge Lawson be placed on the table. A passing reference of Mr. Gladstone to an address to the Crown for the removal of Judge Lawson as one of the possible alternative courses was received with loud cheers from the Irish members. An animated debate ensued, in which the fact was brought out that Judge Lawson, who sentenced Mr. Gray, had prevented him from making a defence, and refused an adjournment of the case. The debate was not resumed in the evening, and the matter was dropped.

Mr. Gray's newspaper, the Dublin *Freeman's Journal*, on Friday said: "Mr. Gray's sentence is absolutely unparalleled. He only received notice of the nature of the proceedings against him on Tuesday night, and was without any time to prepare his defence, which would probably have consisted of affidavits sustaining the truth of his published assertions." It is generally anticipated that Mr. Gray will soon be released by Earl Spencer, and his fine remitted.

On Thursday evening Mr. Gladstone moved, in the House of Commons, an adjournment from Friday until October 24. It was carried wthout a discussion. Accordingly, on Friday, both Houses adjourned without any formality.

A man named Joyce, and his family, consisting of his wife, mother, and daughter, were fired at and killed by a party of men in County Galway, Ireland, on Thursday evening. It is believed in that locality that the Joyces gave information in regard to the murder of the bailiffs of Lord Ardiloun.

Alarming rumors were telegraphed from Paris and St. Petersburg on Friday that Russia was concentrating an army of 78,000 men in the Caucasus, and that she was about to occupy the whole of Asia Minor to the Bosphorus. An official denial of the reported concentration of the troops was promptly issued at St. Petersburg.

There was a concentration of Greek and Turkish troops on the frontier of Thessaly recently, near the border as settled by the Commission. Hostilities seemed imminent, but satisfactory explanations ensued, and the Turks withdrew.

General Ducrot, a French soldier who took a prominent part in the Franco-Prussian war, died in Paris on Thursday, at the age of sixty-five. He was a grand officer of the Legion of Honor, and the author of several works on military subjects, among them a history of the defence of Paris in 1870-71.

The steamer *Hope*, commanded by Sir Allen Young, C. B., which left England in June last in search of the steamer *Eira*, has arrived at Peterhead, Scotland, with the entire crew of that vessel. The *Hope* picked them up in Matotchkin Straits, Nova Zembla, on the 3d of August, they having lost their ship off Franz-Josef Land and journeyed in boats to the straits through the ice. The *Eira* sailed from England in June, 1881, for Barentz Sea, the expedition being a private exploring enterprise of her owner, Mr. Leigh Smith.

Engineer Melville, and the seamen, Nindermann and Noros, *Jeannette* survivors, were given a grand reception at Moscow on their arrival there on Wednesday.

Admiral Feodor Lütke, the celebrated Russian navigator, died on Monday, at the age of eighty-five. He accompanied Captain Golovnin in his voyage round the world in 1817-19. He was the founder of the Russian Geographical Society.

The intention of the British Government to restore Cetewayo to his kingdom causes consternation at Durban, South Africa.

The troubles in Corea have culminated in an insurrection, and the King and Queen have been assassinated. The Japanese legation was attacked by the natives belonging to the anti-foreign party.

DORSEY'S CAREER.

THE *Herald* published on Tuesday some letters of Dorsey's to an Arkansas postmaster, written in 1877, but relating to a transaction which was prevented from furnishing materials for prosecution by the statute of limitations. In these he invites the postmaster, one Clendenning, to fill up a batch of surety bonds to be signed by anybody, and to certify to "the pecuniary ability and responsibility" of this anybody, and then send them on to Washington to be used by Dorsey in getting his fraudulent contracts. The correspondence is a perfect specimen of the swindler's art. The first letter is very affectionate, and only introduces the subject of the bonds, which he desired "made for a friend," after some expressions of friendly interest and hints how to keep his office so that "there would be no trouble," but concludes with a solemn warning "under no possible circumstances to let any one know from whom they (the bonds) came." Clendenning, however, proved to be an honest man, and pointed out to the Senator that he was inviting him to commit a crime. This drew from Dorsey what is probably as good a detected criminal's letter as ever was written. He knew nothing about these bonds whatever. The request he had made was simply to oblige a friend, and, having failed, he cared no more about the matter. But he was surprised that the tone of Clendenning's letter should have been a "little harsh." "It sounds," says he, "as if I had asked you to do an unlawful act, which you proposed to decline with implied indignation" He was shocked at this imputation, and he showed the harsh letter to another postmaster, who said there was nothing in Clendenning's scruples, and that he certified bonds in this way by the hundred. So Mr. Dorsey closed with a gentle reproach to Clendenning for doubting his integrity, and told him to send the bonds to some one else, or burn them up, it being "a matter of total indifference" to him (Dorsey) what became of them.

Curiously enough, another letter of his of exactly the same date as the letter to Clendenning, and addressed to another postmaster, whose confirmation was made while the letter was on its way, has also been unearthed, making precisely the same request, almost in the same terms, also for "an intimate friend," but as "a special favor to him," and also "under no circumstances" to be made known to anybody. Whether he succeeded better in this case than in the other does not appear; but the correspondence in both shows clearly that the man was really an habitual criminal, and was pursuing fraud on the Government through politics as a profession, and with all the dodges, in the way of tones, and gestures, and cant, of the regular pickpocket.

What is most interesting in his case is not, however, his rascality, for nothing is commoner than this. His little games as a criminal could be carried on just as successfully and neatly by scores of confidence men in all the great cities of the Union. What makes his case a remarkable one is the fact that he was able to bring high official position to the support of his real occupation. Great interest was excited some years ago by the extraordinary cleverness of some American swindlers in England, who, simply in order to defraud a London bank, actually formed a partnership in a provincial town, and took the trouble to carry on a legitimate business for two years. This was a very remarkable example of far-reaching forethought and persistence on the part of members of the criminal class, but it really falls short of Dorsey's in brilliancy and tenacity, for he seems to have climbed into the United States Senate, and to have successfully assumed and played the rôle of a statesman and party leader, for the simple purpose of stealing the public money; and by stealing we do not mean corruption in the ordinary sense of the term, but the plain fraud of the police courts, committed through perjury and forgery. We cannot recall anything like this in modern times. Men of high political position have before now fallen victims to pecuniary temptation, but they had attained their high political position through their political talents and attainments before they fell. They rose, in short, because they were worthy to rise, and were overcome by a novel strain on their integrity. But Dorsey seems to have risen and become one of the great men of the state for the purpose of swindling; which is very much as if a man were to pursue a laborious career at the bar in order to reach the bench and thus have decisions to sell.

His case is certainly, therefore, a very interesting one, and one which will repay the study of other people besides political reformers. To these it is most interesting, as showing the way in which the spoils system keeps Senators constantly on the verge of transactions which, even if they do not take the form of ordinary fraud, will not bear examination. The system is one, in short, which some men may carry on and remain pure, but to which no wise man will expose himself if he can help it, and of which any corrupt man may readily make use for the worst purposes.

STATE OWNERSHIP OF RAILWAYS IN ITALY.

THE Italian Government, having purchased all the railways in Italy, finds an elephant on its hands. In order to get at all the facts bearing on the case, a Railroad Commission was constituted in 1878 to ascertain, if possible, how far the present railroad system served the interests of the state, and whether any other system was better. After nearly three years' work, during which sessions were held in almost all the principal Italian cities, the Commission made its report in seven large folio volumes. The last volume contains a summary of the arguments and conclusions of the Commission and is especially worthy of notice. We depend for our points upon a review of the work in a German economic periodical.

At the close of the year 1879 there were in operation in Italy 8,348 kilometres of railroad, of which the state owned 5,384 kilometres, was part owner of 444 kilometres more, and operated 564 kilometres belonging to private parties. By the close of 1880 the state had practically come into possession of all the railways on the peninsula of any importance, without, however, being altogether satisfied with the result. As far back as 1874, the proposition was made by the Government to lease the railways then owned to private parties, but it was rejected by Parliament; and, on a renewal of it in 1877, when it was again rejected, the Railroad Commission was constituted to investigate the question. The report first discusses the railroad as an industrial enterprise. The operation of railways cannot be regarded as one of the functions of the state. He who considers it as such has a false conception of the state, is, if logical, a Socialist, and would end by favoring the absolutism of the state. The operation of a railway is a series of processes partly industrial and partly commercial. It is in every respect a mere branch of business. It is objected that this business is a monopoly. But it is tempered by the competition of other transportation agencies. And, even where this is not the case, since it is the function of the state to protect the interests of the public against the abuse of the railroads, they are naturally better protected when the state is not at once interested party and judge.

Some have expected that freight tariffs would be lower on public railways, but facts disappoint the expectation. The state has, on the contrary, in some countries actually increased freight rates by the introduction of a tax on transportation. In Italy, during the five years following the establishment of the tax, the consequent increase in rates amounted to 73,000,000 lire. In several instances where the management of the roads proposed to lower the rates the Government refused to allow it, lest the burden of paying the interest on the bonds should prove too heavy; and in many states the financial condition would justify such a fear. The state might also treat the freight tariff as a tax and increase it *ad libitum*. For 1876 the expenses of operating amounted to the following per cent. of the gross income in the countries named:

	Public roads.	Private roads.
Germany	59	53
Austria-Hungary	76	50
Belgium	63	59
Denmark	71	55
Norway	74	63
Sweden	63	57

On the average, the running expenses of state roads amounted to 67 per cent., and of private roads to 56 per cent., of the gross income. On the basis of these facts the French Railroad Commission declared in 1878 that the comparative study of these two systems of management, and the tables exhibiting its results, proved that everywhere, in Italy, Germany, Austria, Belgium, state management had been more costly.

It has been objected, again, that private railroads, in the pursuit of their own selfish ends, will be likely to sacrifice the permanent interests of the community for the sake of some temporary advantage to themselves. But it must be remembered that the interests of the railroads and those of the community are in the long run identical. Railroads can be permanently prosperous only so long as the community is prosperous. Moreover, the railroads, being generally chartered for a long or indefinite period, can afford to make temporary sacrifices for the sake of future advantages, and are therefore not likely to come in

conflict with the permanent interest of the community, even if they are left without state control. On the other hand must be considered the influences which work against economy under state management, such as the constantly increasing demands of the general public for better accommodations, greater speed, and more frequent trains. Parliamentary governments are rarely able to withstand such pressure. Already trains are run on the Italian railways with little or no business. The public demands much and wishes to pay but little.

The report considers with great detail the political and economical dangers connected with a state system of railways. The concentration of power in the hands of the Government, and the abuse of that power in the spheres of production, exchange, and consumption, lead to innumerable inconveniences, darken and confuse the simple relation between state and subject, make parliamentary control difficult, and render even an approximately correct budget impossible. The Italian railroads employ more than 54,000 officers, who, with the other public officers, represent an army of 120,000 men. These are scattered throughout the land, appear at elections as political factors, and depend upon the Government, from which alone they have to expect favors. In the year 1879 the Alta Italia gave notice of 120 places to be filled by competition. 2,731 candidates appeared. Of these 2,731, 2,611 had to be rejected. Is it not probable that these discontented persons appeared at election time as dangerous elements? Nor must we forget that nowadays every one who aspires to even the most unimportant position takes care to provide himself with recommendations from influential politicians, and that the Government is compelled in its choice of candidates to strengthen its own party. As a consequence, neither rewards nor punishments are fairly distributed. If, therefore, a state bureaucracy is, under the best conditions, poorly adapted to undertake business enterprises, a set of officers who are neither rewarded nor punished as they deserve will certainly perform their services indifferently. When the Alta Italia passed into the hands of the state, there was a marked deterioration in the discipline and industry of a formerly very excellent body of employees.

The state, again, acquires too large powers of interference in the whole economic life of the nation. It becomes the greatest undertaker, and thus it will determine prices and usages. Other undertakers must follow suit; but there is a great difference between them and the state. The state simply shifts its losses upon the taxpayers; but what are the private undertakers to do, who in the long run must bear both their own losses and those of the state (in the form of higher taxes)? Besides, many difficulties will arise from the laborers themselves. In the workshops alone of three great Italian railroads there are over 9,000 laborers employed. The state will, of course, as railroad operator, own coal and iron mines, and thus have control of an army of workmen. If they demand higher wages, the state will often be compelled to yield. As a strike against the state assumes the character of a riot, in the absence of an impartial judge the state (which is an interested party) must proceed against the laborers with its own police or, perhaps, military. This the Government would be slow to do, at the expense of its own popularity. And what would the taxpayers have to say to all this? It can easily be seen how, under such circumstances, the relations between state and subject would become strained.

Further, a great economical interest is entrusted to an administration whose head changes with every change in the parliamentary majority. Parliamentary control is no control at all. Even now the final balances in the public accounts remain unsettled for years, to be disposed of in two or three hours. Besides, as a matter of fact, the railroad bureaus undertake enterprises and make contracts without any authority from Parliament. And how is it possible to hamper and cripple the management, with its ever-varying necessities, by tying it fast to a budget? But if this is impossible, of what value is parliamentary control when a budget of two milliards (as, for instance, in France) is withdrawn from its supervision? From all these considerations the Commission concludes that the system of state railways endangers political freedom; the power of the Ministry is enormously increased; personal interests become hopelessly involved with those of the public welfare, of politics and administration; they corrupt each other, and thus the form of liberty may be preserved while its substance has been lost. The Commission recommends, therefore, that the state should lease its railways to private companies, the latter to pay all running expenses and outlays for repairs, and also the interest on capital invested by the state. The companies might either pay a certain fixed rent or a given per cent. of their gross income.

We have no space for a discussion of the views above presented. Many of them are just, some exaggerated, and one or two probably false. The Commission evidently has large faith in the results of free competition, and, as it seems to us, too great a fear of state interference. The Italian civil service we might infer to be in much the same condition as our own, from the distrust of the efficiency and honesty of the Government system which the Commission evidently has, and which is quite as evidently based on Italian experience. The report is worthy our careful study.

SOCIETY AND ADVERTISING.

The announcement that a young London club man, well known in Society, is going on the stage, following close upon the heels of Mrs. Langtry's engagement, has caused some excitement in London, and the usual discussion as to whether he is likely to "succeed" in his new venture. Of course, speculations of this sort are not worth much except among those who have actually had some means of judging, but it should be observed that success in such a case has two entirely different meanings. A "society" man or woman who takes to acting may make a hit from having real dramatic talent; on the other hand, what the French call a success of curiosity is almost certain, from the mere fact that Society is interested in the event. The success will be in proportion to the amount of social notoriety the person who makes the attempt enjoys; but almost any one is sure of a certain share of it. It is evident, from the discussions in the London papers, that London Society enjoys having Mrs. Langtry become an actress, and for a variety of reasons. It has one more thing to talk about, and its own importance is increased by one of its leading members doing something eccentric and original. If, after the disturbance which took place some time ago in the Union Club in this city, Mr. Loubat or Mr. Turnbull had suddenly gone on the stage, he would undoubtedly have had an immediate and phenomenal success, though whether either of them has any dramatic ability, it is of course impossible for any one to tell.

The reformers who are always urging a *rapprochement* between Society and the stage, and the impossibility of actors leading good and pure lives unless their art is recognized as entitling them to an assured position in Society, ought to be pleased with such attempts as Mrs. Langtry's and Mr. Farquhar's. If they were to become common—and there is every probability that a good many of them will be made—it would be impossible for Society to regard its life as something apart from that of actors and actresses. Society can hardly give better proof of the feebleness of the old social prejudice against the stage than by its members adopting it as a profession.

It may be said that the notoriety attendant upon débuts of this kind is very offensive, and that Society, being based on the principle of seclusion and reserve, must in the long run discountenance them and cast off such of its members as make them. But this view is based on the antique theory of Society as a close corporation, governed by strict rules, transmitted mainly by inheritance—a body which only exists by rigidly excluding those who do not conform to its code. But Society as it now exists is not like this at all. For exclusiveness and reserve it has substituted notoriety and advertising. It has in England, from which country we derive at present our social ideas, a regularly organized machinery for the purpose. In fact, it is hardly too much to say that Society is getting to be something like a circus, in which the Society newspapers play the part of advertising wagons and brass bands. It announces and describes its parties, balls, dinners, games, rides, drives, with the same publicity that Barnum gives his performances. Its leading performers acquire the same world-wide notoriety that attaches to the "queens of the air" who are able to take flying leaps through six hoops, and their photographs are to be bought at the same stores.

The notion that Society is managed by a very exclusive and fastidious body, which has a holy horror of publicity and sensationalism, is a survival from a period when it really was exclusive, and is wholly unsupported by the facts as they exist. It enjoys and promotes just the same sensationalism that we lament so much in the Church, but which is, after all, characteristic of the Church as it exists. It

rejoices in anything that will bring its performances to the notice of the world at large, and imagines that its interests are advanced by this.

This tendency must often suggest a wonder as to what is going to become of Society in the future. There always must be something of the sort in the world, for Society is nothing more than the organized pursuit of pleasure. But now that it has become recognized that a great part of the pleasure consists in being seen in the act of taking it, and that Society has become a show, and advertises its attractions, it has a great many opportunities which it never had before. The æsthetic tour of Oscar Wilde, under the management of a showman who also ran a burlesque of him, gives us a hint of what we have to look for in the social world. Mr. Wilde took up æstheticism much as Mrs. Langtry and Mr. Farquhar are taking up the stage. Mr. Wilde's whole capital as a reformer comes from Society, which first took him up from its liking for anything odd, and then caricatured him into notoriety. Society is capable of producing many more such attractions, and would really offer a fine field to Barnum, were it not that, from the nature of the case, it has to be its own showman.

THE PARLIAMENTARY CRISIS.

LONDON, August 10, 1882.

As the strong point of the British Constitution is its flexibility, its indefiniteness, its capability of being stretched and twisted to suit the exigencies of an unexpected case, so its weak point is the existence in it of a variety of powers which are expected to work in harmony with one another, but which may by their discord and collision bring about a deadlock. The House of Lords, as everybody knows, is in theory a coordinate power with the House of Commons. Its consent is equally necessary to every act of legislation (setting aside the different functions of the two bodies as regards money bills), and no means exists of overriding its resistance to a measure which the House of Commons may have passed by the most overwhelming majorities, except the extraordinary one of creating Peers sufficient to change the balance of parties in the Upper House. Practically, it has become of late years a received maxim that when the country has been appealed to by a general election, and has given its decision between the programmes placed before it by the two rival parties, the House of Lords ought to bow to that decision. But of course it is often inconvenient to have a general election, both because it is a very heavy fine upon members and because it disturbs the regular course of government at home and abroad. When, therefore, a Prime Minister cannot dissolve Parliament, and finds himself in conflict with the majority of the House of Lords, he is really without any constitutional remedy. He can only appeal to public opinion, and if the Peers deem that public opinion is against them, or are willing to defy it, they can checkmate him—checkmate him for the moment; for, of course, there is a fear of penalties which may result in future.

Such a deadlock between the two Houses has often been dreaded, and has several times seemed on the point of straining the Constitution beyond what its aged frame could bear. The most famous instance was before the passing of the Reform Bill of 1832, when it was with the greatest difficulty, and only by fears of a revolution, that the Lords were brought to yield. We had another a year ago, apropos of the Irish Land Act, when the Lords introduced amendments to which the Commons objected as destroying the value of the measure. For two days the crisis was very acute, and then it became known that the Peers would yield in substance, while receiving some formal concessions to soothe their feelings. We have now just had a similar crisis, very like the last in most of its features, and specially like in the behavior of Lord Salisbury and Mr. Gladstone respectively. The occasion was a smaller one, because the Irish Arrears Bill of this year is a far less considerable measure than was the Irish Land Bill of last year, but the situation was in some respects more complicated and more dangerous, for Mr. Gladstone's Government is not so strong now as it was then, so that there was a greater temptation to the Tory leaders to play for a dissolution of Parliament, while at the same time the state of foreign affairs, with a war just beginning in Egypt, and a possibility of diplomatic difficulties with Turkey and perhaps other European Powers, makes a dissolution a far more inconvenient and even dangerous course.

It is not worth while to trouble you with the minor points of difference between the two Houses as to this Arrears Bill. The principal were these two: Ought the application to the Land Court for the benefit of the Act to be open to either the landlord alone or the tenant alone, as the bill proposed, or ought it, as Lord Salisbury's amendment insisted, to be made only by landlord and tenant jointly, so that the landlord would have the power, if he chose, of preventing the tenant from applying? Ought the value of the "tenant-right," as it is called—that is, the proceeds of the sale of the tenant's interest when it may come to be sold—to stand charged with the payment of the arrears from the present payment whereof the Act relieves the tenant? The bill of the Government, while giving the Court a discretion as to whether they would or not take into account the value of the tenant-right in estimating the tenant's ability to pay, did not charge the arrears upon the tenant-right when a sale should take place. The House of Lords proposed that such a charge should exist. The bill went up to the House of Lords in the end of July. It was read a second time without a division, Lord Salisbury, as leader of the Opposition, announcing that he proposed to amend it in Committee; and when Committee came, these two amendments, with others of less magnitude, were passed not only by considerable majorities, but with a good deal of strong and bold language, Lord Salisbury denouncing the bill in vehement words, and some of his hotter followers declaring that this time there must be no surrender; that the bill was a disgraceful concession to Irish agitators; that the House of Commons was far too subservient to Mr. Gladstone; that the country would support the Peers in resisting his dictatorship, with much more to the same effect.

This attitude startled and alarmed the Lower House, who had by this time become very weary of the Arrears Bill, of all Irish affairs, and indeed of legislation altogether—no more unprofitable session having been seen for many years past. Even the most careless were anxious to get away from work and London altogether, and in no mood for a fresh struggle, while serious politicians felt that the time was a bad one for a crisis which might weaken or even paralyze the executive. The usual course would have been for the House of Commons to proceed forthwith to consider the Lords' amendments. Mr. Gladstone, however, adjourned them for some days, prudently desiring to take time to consider what course his Ministry should pursue, and also to allow the opinion of the country to be fully expressed and to tell upon the House of Lords. He doubtless also hoped that an interval of reflection would sober down the passion for combat, if not of Lord Salisbury himself, at least of a part of his supporters. An anxious week elapsed, everybody asking everybody else what the Lords would do, and the barometer, so to speak, falling and rising from day to day. The hotter Tories argued thus: Mr. Gladstone's Ministry has been discredited by the barrenness of the present session, by its Irish policy, by the outbreak of hostilities in Egypt. It has lost its hold on the country. If it ventures to dissolve Parliament, it may be defeated, and will at any rate come back with a greatly diminished majority. If when stopped by the House of Lords it does not dissolve Parliament, it may resign; and in that case we can come in, carry on the administration for some months, keep Ireland in order by stringently using the Prevention of Crime Act, have a successful campaign in Egypt, and then, on the strength of these achievements, dissolve and get a majority from the country. If, finally, Mr. Gladstone neither dissolves nor resigns, he will at any rate be damaged by the check the Lords will have given him; and a measure wrong in principle and not likely to do any permanent good to Ireland will have been averted. The country is far too much disgusted with legislative remedies for Irish ills to care what becomes of this bill, or to resent the conduct of the Peers in rejecting it.

These arguments were zealously urged by minor Tory speakers, and still more by Tory newspapers, our Conservative press generally going further and faster than its leaders do. On the other hand, the more cautious Conservative statesmen pointed out that if the resistance of the House of Lords provoked a dissolution, the blame of it and of all the injury to our foreign policy which it might involve would be thrown on the Lords; that the chief cry at the election would be a cry against the House of Lords; that this would in fact rehabilitate the Liberal Ministry and make its shortcomings forgotten. Even if Mr. Gladstone were to resign, the time was not a good one for the Tories to come in and succeed him. They could not count on a majority, and to be in office with the House of Commons against them, or even with a very small majority, would be an unfortunate position, dangerous to their future prospects. These reasonings had their effect: the Tory leaders in the House of Commons showed no alacrity for a contest; the feeling of the Tories throughout the country did not promise much zeal in case of a general election; at last the Tory Peers themselves who had supported Lord Salisbury began secretly to waver and doubt whether the ground was a good one on which to give battle to the Commons. When on the evening of Tuesday, the 8th of August, Mr. Gladstone brought the Lords amendments before the House of Commons, it was already beginning to be understood that the crisis was virtually over. Nobody could say that anything had happened; nobody could give any good reason for his belief; yet everybody felt that the thunder-cloud was moving away. The Prime Minister's speech was an instance of that wonderful skill, tact, and delicacy which he can put forth on great occasions; it was eminently respectful and conciliatory toward the House of Lords, and spared all their susceptibilities, while yet intimating a firm resolve to stand by all the essential points of the bill. Some of their minor amendments were to be accepted; others were to be recast; they were to be dealt with neither hostilely nor, as he expressed it, "in a huxtering spirit." This moderate and dignified attitude partly contributed to the largeness of the majority—one hundred and thirty-six—by which his dissent from

Lord Salisbury's principal amendment was carried. When the numbers were announced it was felt that the struggle was ended, not so much on account of the mere difference in numbers, as because it was plain that the Tory party had not put forth its full strength. Some of its most judicious and respected members refused to vote, and it was certain that the feelings which moved them would move the Peers also.

So it has now turned out. This evening, after a previous private meeting with his supporters in the House of Lords, Lord Salisbury has declared that though he retains all his objections to certain parts of the Bill, and would reject them if he could, the bulk of his party does not agree with him, so that he has no choice but to give way, while disclaiming all responsibility for "an act of robbery." We are thus in smooth water again. The remaining business of the session will be chiefly formal. The country will breathe again after the mingled excitements and vexations of the last six months. Nothing will remain from this latest constitutional crisis except a strengthened distrust of Lord Salisbury's leadership by the more moderate Tories, and a strengthened desire to agitate against the existence of the House of Lords among the less moderate Whigs. Y.

"PARSIFAL" AT BAYREUTH.

A RETROSPECT.

BAYREUTH, August 1, 1882.

FRANZ LISZT wrote to a friend in 1875, after listening to about twenty rehearsals of the "Ring of the Nibelung" at Bayreuth: "It overtops and commands our whole art-epoch as Mont Blanc does the other mountains." In "Parsifal" a new summit has been raised by the volcanic force of genius, but it belongs to another chain. It is the culminating point of religious music, which has only once before, in Bach's Passion Music, reached to a similar height. An agnostic confessed to me, after listening to "Parsifal," that in this dramatic apotheosis of religious music he had for the first time realized what was meant by religious emotion. Those unfamiliar with the details of Wagner's life are apt to imagine that old age, which naturally turns men's thoughts toward religious affairs, explains the choice of such a subject for his last drama. But Wagner's interest in religious symbolism is of much older standing, as his oft-expressed admiration for Palestrina and Bach alone would have sufficed to show. In 1843 he composed for a music festival a Biblical scene, "Das Liebesmahl der Apostel," and six years later he conceived the plan of writing a work on the subject of Jesus of Nazareth, which, however, he subsequently laid aside as impracticable. The former work has probably, and the latter beyond doubt, furnished some of the poetic motives for "Parsifal." By transferring his conceptions to the mystic regions of mythology, they became available for theatrical purposes, and the result was "Parsifal," which its author appropriately called neither a music drama nor simply a festival drama, but a festival-consecration drama—why, only those can appreciate who have heard it; for it is a matter of feeling, not of intellect.

A German critic has already expressed his fears that the religious feelings of some people will be offended by some of the scenes and proceedings in "Parsifal." I cannot believe this, unless religion be synonymous with the crudest bigotry and ignorance. Nevertheless, it is doubtful if Herr Neumann could obtain permission to produce this work on the London stage next spring, or as long as the present laws in regard to the exclusion of religious subjects from the theatrical stage prevail in England. On the concert or oratorio stage, of course, Biblical personages may appear in dress coat and kid gloves and sing those love songs which Handel transferred from his worldly operas to his oratorios; but they may not, on the dramatic stage, walk and act in appropriate costumes singing appropriate music. The distinction is one of those profound subtleties which my feeble mind is utterly unable to comprehend, all the more as the modern drama is generally derived from mediæval religious miracle plays. The stage, it is true, is often, or let us even admit commonly, used for frivolous purposes; but is that any reason why, therefore, any class of pure and noble subjects, which cannot but refine the audience, should be excluded from it altogether? The logic is absurd.

As given at Bayreuth the performances of "Parsifal" extend over six hours—from 4 to 10—only four of which, however, are devoted to the drama, the remaining time being devoted to recreation in the open air or refreshments in a restaurant, whence the hearers are summoned to their seats again by the Parsifal or Grail motive blown by trombones and a trumpet on the balcony. These long intermissions suggest the performances in the days of Bach, when part of a long religious work was given in the morning and part in the afternoon. Over-fatigue is thus avoided, and the third act, which is the grandest of all, is much more appreciated than would be possible in any other place where such an arrangement would not be feasible. That the four hours of music are not exclusively of a religious character is self-evident, as Wagner is too great a dramatist to overlook the necessity of contrasts. In the second act we have the weird, gloomy scenery and music of the wizard *Klingsor*, followed by the brilliant colors of the magic flower garden (suggesting the Venusberg in "Tannhäuser"), the captivating forms of the flower-decked girls, and the sensuous charm of their song. In the first we have reminiscences of "Lohengrin," the death of the swan, followed by the reproaches of *Gurnemanz*, which are expressed in poetic language of the greatest beauty, introducing a most touching episode. *Kundry's* mysterious character, with its various psychic transformations—now as the wandering, unhappy bearer of a great curse, now as the submissive servant of the Grail, and again as the lovely, alluring slave of *Klingsor*—gives scope for effective contrasts and bold situations. *Parsifal* unites with the character of a saviour that of a second *Siegfried*, who grows up in a forest, ignorant of the world and its ways and of any but the natural love of woman, until he meets *Kundry*, whom he relieves from her curse by resisting her blind, delusive temptations. The unhappy *Amfortas*, a modern Philoctetes, appeals to our pity, even as the wounded *Tristan* in the drama of that name. *Gurnemanz* is an admirably-drawn character, to whom some of the most melodious and expressive music is allotted, notably the sublime benediction motive after the anointment of *Parsifal*—one of those scenes which make the poor critic realize most vividly the immense superiority of musical expression to the written words which fain would give an idea of its beauty.

It has been repeatedly asserted that Wagner has in "Die Meistersinger," and again in "Parsifal," "gone back on himself" to a certain extent by abandoning some of his theoretical notions and reverting to his second, semi-operatic period. He has done no such thing. "Parsifal" is in its form as perfect an embodiment of his theories as is "Tristan," with which it has much in common, especially in harmonic structure and in the *Amfortas* music. Nowhere has the skeleton of the music-drama, the system of leading motives, reached such absolute formal perfection as in "Parsifal." These leading motives characterize the general emotional aspect of each person in the drama as vividly as the poem itself. They are usually assigned to the orchestra, but are not played each time a person speaks or acts. *Parsifal* may sing for ten minutes and his own motive not be heard once, unless reference is made to his own peculiar mission in the dramatic plot. These motives have a three-fold import. They are always admirably adapted to the prevailing "tone" of each character, be it frivolous, sentimental, heroic, gloomy, tender, or ferocious; and no one succeeds better than Wagner in embodying each person's "tone" in tones. Then they gain a great psychological value in the drama by calling up a presentiment of a coming event, as when *Kundry* in the first act falls into her sleep of exhaustion, while *Klingsor's* magic motive is heard; and in the second act we behold *Klingsor* invoking her to the same music; whereby the two events are at once connected in the hearer's mind. Thirdly, a leading motive can serve as a reminiscence, and thus associate the past with the present in one moment, while it would require many minutes to explain the same situation in words or by a scenic change. In these three elements lies the epoch-making value of the leading motives. Wagner's motives are of great rhythmic, melodic, or harmonic beauty, and almost always of plastic simplicity, so that they can be easily retained in the memory. Often, however, they possess no particular charm in their primitive skeleton form, and no more suggest the gorgeously colored instrumental tapestry the composer weaves with them than Bach's fugal themes suggest the wonderful structures he builds on them.

The vocal parts of the actors are in "Parsifal" in the same accordance with the style of "Tristan" and the "Nibelungen." We have here neither old-fashioned melody or tune nor recitative, but something intermediate between the two, which allows the words to be clearly spoken while retaining a melodious flow. The proper word for it is melodious declamation. But there is also a good deal of choral music in "Parsifal"; and in this it might seem as if there were a case of "reversion" to the "Lohengrin" period. Wrong again. Wagner does not assert that choral music should be banished altogether from the stage, but only when its introduction has no other aim than that of producing "effect," by making music the end and the drama the means, instead of vice versa. The stage is a mirror of life, and in its proper place a chorus can be as dramatic as anything else. Even the florid melodies we hear in Italian operas might under some conditions be called dramatic; if, for instance, the scene were laid in the room of a singing-teacher giving a lesson in trills, runs, and *fioriture* in general to one of his pupils. In an otherwise appreciative notice of "Die Meistersinger," an English critic lately said that "in the final scene the three choruses of shoemakers, tailors, and bakers, most charming and genuinely comic as they are, can hardly be justified by the composer's theories." Yes, they can. If Wagner brings a Volksfest on the stage, nothing can be more dramatic than the introduction of such processions, songs and dances, for they are an exact reproduction of the scenes which have often been witnessed in that Nürnberg meadow, famous for its historical processions. So, in "Parsifal," the choruses of knights, youths, and boys are highly dramatic in effect, as they help the hearer to realize fully the ecclesiastic situation and to forget that he is a mere spectator before the stage. Even the "four-storied" arrangement of these choruses is justifiable; for when the Grail motive is taken up successively in a higher position first by the knights on the

stage, then by the youths midway up the cupola, then by the boys at the top, and finally by the violins in their highest position, down in the mystic abyss, the effect is quite ethereal and superterrestrial; it is an effect with a cause, and in accordance with the situation, and not an "effect without a cause," as in the operas of Meyerbeer and others.

In its dramatic structure "Parsifal" is equal to the best of its predecessors. It would be a mere truism to say to-day that no dramatic poet ever had a more admirable instinct for stage effect than Wagner, Shakspere not excepted. Even the long episodic narratives which contain the exposition are exceedingly interesting if every word is as distinctly pronounced as it is by some of the vocalists assembled here, notably by Scaria, who is the lion of the present festival, although Materna, Brandt, Hill, and Winkelmann are very close approaches to him. The poetry of "Parsifal" is, of course, devoid as a rule of rhetorical embellishments, figures of speech, and similes, for these are here supplied by the music, which is like the soul breathed into the dramatic body. There are some beautiful exceptions to this statement, which space alone forbids my quoting. A "reversion" might be imagined in the fact that rhyme is introduced, were it not that in this "Christian" drama this is quite in place, as Wagner himself has explained that rhymed verse is the characteristic form of Christian poetry. Alliteration, on the other hand, is not resorted to in this drama. The repetition of a number of soft or harsh consonances in one word intensifies the general tone of softness or harshness of the situation, and is therefore desirable in a drama like "Tristan," but not in a religious drama like "Parsifal," where the tone must be more quiet and subdued, even as the music itself, which is more solemn, majestic, and ethereal than in Wagner's worldly dramas. "Parsifal," I repeat, rightly bears the name of "stage-consecrating play," for by it the stage is consecrated for religious purposes.

I cannot close my Bayreuth correspondence without a parting reference to the theatre in which these performances are taking place. Of the successful *ensemble* I have already spoken, and it would not be worth while at this distance to compare the merits of the singers who alternate in their rôles. But to the theatre itself attention cannot be often enough called, for it is the only existing theatre in which a complete illusion is attained; and if at the present day an architect undertakes to build an opera-house on any old-fashioned system, he can only be accused of either great wilfulness or gross ignorance. I earnestly hope that if a new opera-house is to be built in New York, the Bayreuth model may be taken into consideration. The very entrance puts the spectator in an artistic mood. The whole theatre is one parquet, in the shape of an amphitheatre, each row rising above its predecessor, so that up to the royal boxes in the background one seat is about as good as another. There are no boxes at the sides, their places being taken by simple but handsome columns, between which are the twelve exits by means of which the whole house can be emptied in two minutes. Especially advantageous is the absence of a proscenium box connecting the stage with the auditorium. Its place is taken by an open space between the last columns and the stage, leading down into the mystic abyss in which the invisible orchestra is at work. The effect of this open space is that it makes the stage seem further removed, while the figures on it are as large as before, and, in consequence, by a familiar optical illusion, everything seems larger and more distinct, the difference between our ordinary stages and that of the Wagner theatre being similar to that between a photograph and a stereoscopic view. This optical illusion is rendered the more complete by the invisibleness of the musicians and the conductor to the audience, although the conductor is visible, of course, to the vocalists. The sounds rising from the mystic abyss are not localized by the hearer. They seem to come from the stage itself—to hover about the singers as its fragrance does about a rose; and the music thus gains that exquisite charm which alone belongs to invisible music, as all those know who have ever been waked up in the morning by a serenade. The sounds, too, are somewhat subdued, so that the singers are never "drowned," as so often happens in ordinary theatres. The only disadvantage of the present arrangement is that the brass, being actually placed under the stage, is a little too much subdued, for which reason the stirring fortissimo passages lose some of their accustomed splendor and glory. But this shortcoming can probably be remedied by a somewhat different acoustic arrangement, while retaining all the present advantages.

Three performances have now been given, and the house has been full each time, while the enthusiasm has steadily increased. I have already written that on the first night Wagner begged the audience not to applaud after the first and second act, so as not to spoil the "Stimmung." This request was respected by the audience on the second night, when the majority still belonged to the society of patrons. On the third night, however, the audience was of a more miscellaneous character, and, in spite of the efforts of the faithful, the applause broke out like a storm after the second act. *Que voulez-vous?* The people are accustomed to express their approval by clapping their hands, and it is not easy to cure them of this habit, although it certainly would be more artistic to wait till the end. The fact, however, that the hearers—and those not the full-blooded Wagnerites—would applaud in spite of Wagner, proves better than any adjectives of my own the beauty and impressiveness of "Parsifal." Many who came to hear only one performance left Bayreuth after securing tickets for a later performance, and there are some who have tickets for all the sixteen nights.

THE RESTORED CASTLE OF CHANTILLY.—II.

PARIS, August 4, 1882.

I HAVE attempted to describe the Château of Chantilly in its present state. I have left aside, however, the principal room in the new Château, which has received the name of the *Tribune*, as it somewhat recalls, by its dimensions, the famous Tribune at Florence. This room is circular, and placed in one of the three towers which flank the great polygon of the Castle. The gem of this choice collection is the famous "Vierge d'Orléans," by Raphael. This picture belonged once to the Regent, and adorned for a long time the Orléans gallery; it was sold at the time of the Revolution, and came into the possession of M. Delessert, the banker. At his death it was sold at public auction in Paris, and the Duc d'Aumale, who was at the time in exile in England, had it bought for the sum of 150,000 francs. Such treasures have really no price. The "Vierge d'Orléans" is a picture of modest dimensions; it has all the freshness, the youth, the grace of the *péruginesque* manner of Raphael, while it has already the perfection, the solidity, the grand style of the Raphael of the third manner. It is a sort of connecting-link between the end and the beginning—a résumé of all the qualities of this ever-admirable master. The child has on its little face the stern expression which was so intensified in the great Madonna which is now admired in Dresden. The Virgin is perhaps the prettiest of all the Madonnas painted by Raphael. The color is as fresh as on the first day—no hand has ever touched this delicate masterpiece; it can safely be said that it is now exactly as it was when it came from the hand of the greatest painter of all times.

This picture is placed on a little stand by itself; close by it are two portraits placed also apart. One of them is a picture which has been, so to speak, rediscovered. It was part of a collection of portraits, called the Collection Lenoir, which was formed at the end of the eighteenth century by a M. Lenoir, who was a great amateur, and sold by him in England to the Duke of Sutherland. These historical portraits for a long time adorned the rooms of Sutherland House; they did not attract much notice, as they were chiefly portraits of Frenchmen and Frenchwomen. Many were by Janet, called Clouet, and Clouet has only become the fashion again lately, since the revival of the French historical school. A few years ago the present Duke of Sutherland sold the Lenoir collection to the Duc d'Aumale, who valued it chiefly on account of its historical character. Among the rest, there was a portrait which much attracted the notice of those who first saw it in France. It was evidently painted by one of the earliest painters in oil; it recalls the manner of Van Eyck or of Antonello da Messina. The Duc d'Aumale had a very good copy made of the famous head of a condottiere by Antonello, which is in the *Salon Carré* of the Louvre. It is impossible not to be struck with a certain similarity between the picture by Antonello and the portrait I am now speaking of. On looking closely at this portrait, which is painted on wood, curious traces were found on the back, which was quite blackened by dirt and by age. It was washed carefully, and on it were found monograms and emblems, and a device: "Nul ne s'y frotte." There was no doubt now: the portrait represented a prince of the House of Burgundy who is called the "Grand Bâtard de Bourgogne." He wears the Golden Fleece, the curious black pointed cap over long hair. In my opinion, it was painted by a pupil of Van Eyck rather than by Antonello da Messina. Whatever be its origin, it is a most curious relic, and nothing can exceed the perfection of it, in a technical point of view. The young Prince has a hard, wicked, stubborn expression; he seems alive, and I doubt if ever life has been represented with a more extraordinary degree of realism.

The third picture placed apart is a portrait of the Cardinal de Bourbon, a great-uncle of Henri IV., not the Cardinal de Bourbon of the Ligue. This picture is much older than the preceding; it is also very interesting, both historically and technically. Among the pictures of the *Tribune*, I will mention at once a portrait of Molière, as it was also sent from England in the Collection Lenoir. This portrait had been quite forgotten, and the French amateurs were not aware of its existence. It was thought that the best likeness of Molière was his portrait by Mignard, which may be seen in the foyer of the Théâtre-Français. There is a very interesting life of Mignard, which was written after his death, in which it is related that this painter was extremely fond of Molière, and that he made his portrait three times. We have now the portrait of the French Theatre and the portrait in possession of the Duc d'Aumale (which is undoubtedly, in my eyes, by Mignard); what has become of the third? I have tried in vain to discover it: it has probably been lost or destroyed. The portrait of the French Theatre represents Molière in one of his costumes as an actor, rouged, with a false moustache, and with a wig. The portrait which be-

longs to the Duc d'Aumale represents Molière as he was—as a man ; and in this respect it is invaluable. You see there the true Molière, the unfortunate husband, the worn-out, sad, melancholy creator of so many immortal types. His mouth, with thick lips, has a curious curve, as if even smiling had become painful ; his eyes are heavy and red, with an indescribable sweetness and sadness. I know of nothing more pathetic than the face of this true Molière ; it makes you love the man, it fills you with pity. If Mignard had only painted this picture and the portrait of his daughter, which is in the gallery of Versailles, he would be a very great artist. There is no *mignardise* in it ; it is nature itself.

The *Tribune* of Chantilly has some pictures of the early Italian painters, which come chiefly from a collection formed by M. Reiset, formerly custodian of the Louvre (the catalogue of this collection was published by M. Reiset when he intended to sell it at public auction ; but the Duc d'Aumale bought the whole collection before the sale took place). One of the finest pictures in it is a portrait of the famous Simonetta by Pallajuolo. It has all the qualities of the precursors : it is bold, original, and has an intense individuality. I must cite also an allegorical figure of Spring, by Sandro Botticelli. Spring is represented by a tall young woman, with flowers in her arms and children clinging to the folds of her gown. The children are somewhat grotesque, as is often the case in Botticelli's pictures ; but the young woman is very charming. She has all the grace, the elegance, of the best figures of this extraordinary painter, who was at the same time a naturalist and an idealist.

I cannot cite here all the ancient pictures of this collection. There are some beautiful portraits of the sixteenth and of the eighteenth century. The modern school is represented by some very remarkable specimens. I will name first a portrait of Bonaparte, then First Consul, by Gérard. It is perhaps the best portrait of the greatest man of our times. The face has a classical beauty, and is full of genius ; at the same time, the brow and the clear eyes have a hardness which verges on cruelty. The First Consul wears the very simple green uniform of the Consular Guards.

The Duc d'Orléans, the eldest son of Louis Philippe, was a great patron of literature and of art. He was acquainted personally with Musset, with Decamps, and many others ; he ordered once two pictures of moderate dimensions from Ingres and from Delaroche. The price was to be 6,000 francs apiece, which was thought very generous in the year 1830. Ingres made for the Duke his "Stratonice," and Delaroche his "Assassination of the Duc de Guise," which is by far his best picture. The Duke was so satisfied with the pictures that he sent to each of the painters 12,000 francs—double what had been agreed on. The Duc d'Aumale is now the possessor of these two pictures, which are very good specimens of the school of 1830. The "Stratonice" does not find as many admirers as it did once : Alma-Tadema and others have shown us Greece and antiquity in truer colors. Still, it cannot be denied that the composition is very noble, and that the æsthetic effect is considerable. The "Assassination of the Duc de Guise" is truly a magnificent picture ; it has every quality—line, color, truth ; it is a page of history. Delacroix is represented in the *Tribune* by one of his best pictures, the "Two Foscari," a most pathetic composition. The old Doge is obliged to deliver his own son to the torturers. The color of this great scene is very much admired by all artists. In order to be complete, I should have to make a real catalogue. I will only say that Watteau and Prudhon are very well represented in this room, where every picture is a choice one.

Thus far I have only spoken of the showrooms, if I may so express myself, of the new Castle. There is, besides, a great *corps de logis*, which forms what is called the Apartment—that is to say, it is destined for the most distinguished guests who will be received at Chantilly. This part is not quite finished, and is not visible to the public. Many works of art, tapestries, pictures, bronzes, etc., have already found a place in the fine rooms, which look out on the enormous parterre planned by Lenôtre. In the centre of this parterre one sees a statue of the Grand Condé, in a sort of Roman dress. The Duc d'Aumale has ordered other statues, which will be near the statue of Condé. Bossuet has already been finished by M. Guillaume ; he was a great friend of Condé, and delivered his funeral oration, as everybody knows. The other statues will be those of La Bruyère (who was a preceptor in the house of Condé, and who composed his immortal 'Caractères' at Chantilly), Molière, and Lenôtre. There are, besides, in the parterres several allegorical statues. Chapu has just finished two very pretty ones, "Pluto" and "Proserpine." Proserpine is seen gathering flowers, and Pluto watches her at a distance, concealing himself among marine plants. These statues give a very noble character to the old French parterres, which are made a sort of continuation of the architecture of the great Castle.

In our artistic world great curiosity is felt on the subject of the statue which Dubois is preparing for the Constable's Terrace. The model already set up there, and to which I alluded in my last letter, is a rough sketch, which Dubois only made so as to get a true impression of the scenery, of the height of the pedestal, of the general effect of the work. But, as I have said, it would not be fair to judge his future work by this *maquette*. Dubois is the most conscientious of artists ; he is never satisfied. In fact, he is in danger of spoiling the work of his inspiration by over-correcting. We may feel sure that he will spare no pains to produce an equestrian statue of the Constable worthy of the great name of Montmorency, worthy of Chantilly and of its present proprietor, who is doing his best to make of Chantilly a kind of museum of French history.

Correspondence.

ERRORS OF THE CENSUS.

To the Editor of The Nation :

Sir : I should like to call your attention to some errors in the Population Volume of the Tenth Census.

Table I *d*, on page 5, purports to give the number of inhabitants to the square mile of land surface in each of the States and Territories at the date of each enumeration. From this table we learn that in 1870 Connecticut had, for every square mile of her surface, 110.9 inhabitants, and that in 1880 this number had decreased to 107.8. The natural supposition would be that the population of the State was less in the latter year than in the former. But Table I *c*, on the same page, indicates that the population had *increased* during the decade to the extent of 15.8 per cent. ; and Table I *b*, on the opposite page, gives the number of inhabitants in Connecticut in 1870 as 537,454, and in 1880 as 622,700. According to the Special Census Bulletin which gives the area of the States and Territories, the land surface of Connecticut is 4,845 square miles. Experiment will show that if the population of the State at each Census be divided by this number, the quotient will be identical with the figures which Table I *d* gives as the number of persons to the square mile at that date, except in 1880. In that year the quotient will be 128.5, and, as we have already seen, the figures in the table are 107.8. As Connecticut has not increased in area in the last ten years, it follows that the table is wrong, and that instead of 107.8 inhabitants to the square mile in 1880, as is asserted by it, Connecticut really had 128.5.

In the same table (I *d*, p. 5) the number of persons to the square mile in the District of Columbia in 1870 is stated to have been 2,191.0 ; in 1860, 750.8 ; and in 1850, 516.9. The increase of population between 1860 and 1870 thus appears to have been about 181 per cent. Table I *c*, on the same page, however, says that the increase was only 75.4. The area of the District is 60 square miles (see Special Census Bulletin on Areas). The population in 1870 was 131,700 ; in 1860, 75,080 ; and in 1850, 51,687. If the population at any period be divided by 60, the quotient will be the number of inhabitants to the square mile at that period. The results obtained in this way are below contrasted with those given in the Census :

	Result of Division.	Census Result.
1870.....	2,195.0	2,191.0
1860.....	1,251.3	750.8
1850.....	861.4	516.9

The error of 4 in 1870 is apparently a mere slip. The mistakes in 1860 and 1850 are of a more interesting character. It will be noticed that the figures for those years given by the Census are the exact ones which would be obtained if the population in those years had been divided by 100. The area of the District of Columbia was originally 100 square miles. In 1846, however, Alexandria County was receded to Virginia. Since that time the area has been, as above stated, 60 square miles. The Census Office kept on using the old area till 1870. It is not speaking harshly to say that this error is evidence of great carelessness.

Among other maps in this volume is one showing the curves of mean annual temperature. On page 17, Table I *m* purports to give the number of persons in each State and Territory living between the several curves. The map and the table correspond in form and intention, but, as will presently appear, they frequently contradict instead of confirming each other. Thus the map places a considerable tract in northern Arkansas between 55° and 60° of mean annual temperature. If this tract be carefully measured, it will be found that it must comprise the counties of Benton, Baxter, Boone, Carroll, Fulton, Madison, Marion, Washington, and parts of several others. The population of the counties named is 107,861 (see p. 50), whereas, according to the table (I *m*, p. 17), that part of Arkansas having a mean temperature of 55°–60° has a population of only 12,647.

According to the same table, the entire population of Maryland lives in the belt of country in which the mean annual temperature does not fall below 50° ; but on the map the curve corresponding to a mean temperature of 50° crosses the State at about the longitude of Hagerstown. All the State west of this curve has a mean annual temperature of 45°–50°. Garrett, Alleghany, and part of Washington Counties are west of this line. The population of the first two alone is 50,187 (see p. 64).

The same map indicates that the temperature of something more than one-half the area of West Virginia is 45°–50°. Measurements will show that this part of the State comprises counties whose aggregate population is rather above than below 210,000. Yet the table (I *m*, p. 17) gives its population as 22,193.

On the same map, the curve corresponding to 55° mean annual temperature divides Missouri into two unequal parts. About three-fifths of the State lying north of this curve have 50°–55° mean annual temperature, and about two-fifths

lying to the south of it a mean annual temperature of from 55° to 60°. Just on the northern boundary there is a small piece, made up of parts of Putnam, Harrison, Mercer, and Worth Counties, in which the mean temperature is 45°–50°. Thirty thousand would be a very large estimate of the population of this tract. The entire population of the four counties named is only 56,735 (see pp. 68, 69). In the extreme southeast corner of the State there is a strip of land which, as closely as can be judged, is about coterminous with Dunklin and Pemiscot Counties, in which the temperature is 60°–65°. The aggregate population of these counties is 13,903 (see pp. 68, 69). Now, the table (I *m*, p. 17) puts 1,323,176 people in that small section of northern Missouri in which the mean annual temperature is 45°–50°; 831,301 are assigned to the three-fifths of the State where the mean temperature is from 50° to 55°; and only 13,903 people are given as the inhabitants of the southern two-fifths of the State in which the mean of the thermometer is 55° to 60°. This last-named portion of the State, as represented on the map, contains the city of St. Louis, whose population is 350,518 (see p. 246). No population at all is credited to the small area in Dunklin and Pemiscot Counties which has a temperature of 60°–65°. It is plain that there is an error somewhere.

It will be noticed that the population credited to the 55°–60° belt—viz., 13,903—while absurdly too small for it, is exactly the population of the two counties in the tract having a mean temperature of 60°–65°. 831,301 seems rather a small population for the thickly-settled counties in the northern three-fifths of the State, but it is just about what we should expect to find in the 55°–60° section. 1,323,176 is an impossible population for a belt of country taking in parts of only four counties, the aggregate population of which is, as we have seen, only 56,735, but it is a very reasonable number for the inhabitants of the 50°–55° belt of the State. In short, the figures for Missouri in this table (I *m*, p. 17) have all been moved one column to the left of their proper positions. It is true that if this explanation be accepted, it would appear that it had not been intended to credit any population at all to the part of the State having a mean temperature of 45°–50°; but the proof is too plain that the error arose in the manner suggested for this circumstance to cast any serious doubt upon that explanation, especially as we have already seen that omissions in this table of even more important groups of population are by no means rare. The blame for this misplacement of figures cannot be saddled upon the broad shoulders of the printer, for it is carried through no less than four tables (I *l*, p. 16; I *m*, p. 17; I *n*, p. 18; I *o*, p. 19). It certainly seems that a very little vigilance would have sufficed for the discovery and correction of so patent a slip.

This is but the first instalment of the errors and inconsistencies discovered by me in this volume; I may soon call your attention to others.

JOHN C. ROSE.

BALTIMORE, MD., Aug. 15, 1882.

THE MANUFACTURE OF HAY.

TO THE EDITOR OF THE NATION:

SIR: Referring to your remarks on hay in this week's issue, may I, as a practical yeoman, ask how the article may be "cured," or manufactured, by "only lying in the sun"? Such simplicity would materially lighten the labor and expense of harvesting a crop which, to a New England farmer, is of some value during the long winter.—Yours,

H. S. RUSSELL.

HOME FARM, MILTON, August 12, 1882.

[The hay is cured by "only lying in the sun." What the practical yeoman does is to make it lie in such manner that the sun can get at it. Nothing else that we know of is done, except cart it home to the barn; but if this constituted "manufacture," coal would be a manufactured article, and so would seaweed used as manure. At all events, we have the authority of the courts for saying that haymaking is not "manufacture," and maintain that it consists in exposing cut grass to the sun's rays. We greatly doubt, however, whether this explanation will be of much use to the practical farmer.—ED. NATION.]

THE DUTY ON BICYCLES.

TO THE EDITOR OF THE NATION:

SIR: You mention that a manufacturer of bicycles only asks to be "let alone, . . . being neither helped nor hindered." According to the newspaper accounts, this is exceedingly inaccurate. The manufacturer of bicycles asked to have the duty on steel lessened, but not the duty which falls on bicycles. He did not ask to have the 35 per cent. *ad valorem* duty on bicycles remitted, or inform the committee that by means of this heavy duty, and $10 royalty charged for patents, the Pope Manufacturing Co. has established a monopoly which, even for an "infant industry," is exceedingly oppressive.

It was truly "a very unreasonable position for an infant to take."—Respectfully,

M. B. T.

MILWAUKEE, August 16, 1882.

THE LANDING OF THE PILGRIMS.

TO THE EDITOR OF THE NATION:

SIR: Your valued correspondent, Dr. Dexter, in his communication of the 20th of July, has briefly referred to a number of authors whose testimony he did not cite. Some of this evidence seems to me too valuable not to be laid before your readers. Some additional facts and reflections suggested by the discussion follow.

In Dr. Belknap's sketch of the life of Governor Carver, published in the second volume of his 'American Biography,' issued in the year of his death, 1798, he says, in reference to the landing from the shallop, "Monday, December 11th":

"The rock on which they first stepped ashore, at high water, is now enclosed with a wharf. The upper part of it has been separated from the lower part, and drawn into the public square of the town of Plymouth, where it is distinguished by the name of *The Forefathers' Rock*. The 22d of Dec. (Gregorian style) is regarded by the people of Plymouth as a festival."

Dr. Belknap was born in 1744, twenty-five years before the Old Colony Club instituted the celebration of the landing on the 22d of December. And he says here that the people of Plymouth celebrate that day as expressing in the Gregorian calendar, the day of the landing.

Dr. James Thacher, an Old Colony man, in his 'History of Plymouth,' 1832, pages 24, 25, has a long account of the landing from the shallop, "on Monday, the 11th day of December, O. S.," after which he proceeds to say: "This, then, is to be considered as the first stepping on the Rock of the Pilgrims from the shallop belonging to the *Mayflower*, and this is the *birthday of our nation*." He then says that the day usually celebrated, the 22d of December, has hitherto been supposed to correspond to the 11th, O. S.; that this is an error, and that the 21st should hereafter be commemorated. He then proceeds to give a long history of the introduction of the Gregorian calendar, and the reason for the blunder which the Old Colony Club made in 1769 in assigning the 22d of December instead of the 21st, as the true day for celebrating the landing.

Dr. Thacher was born in 1754, fifteen years before the Old Colony Club was instituted, of which he gives a history, and he may reasonably be supposed to have been informed on all the questions here discussed. He lived in Plymouth nearly all his life. As he could not have been ignorant himself of the significance of the day celebrated as that of the Landing, so he must have known the views of others who were equally intelligent with himself.

Judge John Davis, the editor of Morton's 'Memorial,' was emphatically the antiquary of the Old Colony. What he and his brother, Samuel Davis, the author of 'Ancient Vestiges,' did not know about the antiquities of Plymouth was not worth knowing. Judge Davis was born in Plymouth in 1761. He must have known all about the Old Colony Club, and about all its members, and about all the orators, of which he himself was one, of Forefathers' Day. He must have known, himself, the day he was commemorating, or the event he was commemorating. In a note to his edition of Morton's 'Memorial,' 1826, page 48, he quotes from "Mourt" the well-known passage of the landing from the shallop on Monday, the 21st of December. After saying that the place of the landing is satisfactorily ascertained, he says:

"The 22d of December, corresponding to the 11th, Old Style, has long been observed at Plymouth, and occasionally at Boston, in commemoration of the landing of the Fathers. The New England Society, in the city of New York, annually celebrate this day by an appropriate festival. At Plymouth it has universally the familiar appellation of *Forefathers' Day*."

Judge Davis says nothing here about the error of one day in reckoning from old to new style; but in a later *manuscript* note in his own copy of the memorial, now before me, written on this page, he says: "In 1620, December 11, O.S., corresponded to December 21, N.S. When the anniversary was instituted at Plymouth, in 1769, *eleven* days were added for difference, instead of ten, the true difference. The difference between old and new style then existing was incorrectly assumed in determining the day of celebration," etc.

Why should we seek to relegate to the region of myths the well-known facts of history? There are myths enough already woven into our history against which we may sharpen our wits while we expose them; so we can afford to let the facts that have an historical basis stand. We see here how the celebration of the 22d of December came about. There was a landing of the Plymouth fathers on the 11th (21st) of December, 1620; and any one who wishes to celebrate the day may be sure of its genuineness. There was no landing there on the 22d, old style or new style, of which there is any record. Why, then, confuse the minds of people by getting up or perpetuating a celebration on that day? Why introduce an element of myth into Plymouth history where the facts are clear? The story of the landing *upon a rock* is traditional. It has been handed down from an early period, but it does not rest on contemporaneous record. But the landing from the shallop somewhere within the Bay, and the marching into the land on Monday, the 11th of December, O.S., 1620, is a matter of record at the time.

Some surprise has been expressed, mingled with incredulity, that the Old Colony Club, in 1769, should have so blundered on the subject of the old and new style; but as wise persons as they have blundered since, and continue to blunder, about the same thing. Dr. Belknap delivered in Boston, in 1792, before the Historical Society, a discourse to commemorate the discovery

of America three hundred years before, on October 12, 1492; and the day selected for the celebration was October 23—eleven days being added, after the reckoning of the Old Colony Club, whereas, for the year 1492, but *nine* days were required to represent the difference.

The American Antiquarian Society was founded in 1812, and in the following year they instituted an annual celebration to be held October 23—that being, they say, the anniversary of the discovery of America by Columbus. The annual meetings of that Society continued to be held on that day till, about thirty years ago, after Mr. Savage's report to the Pilgrim Society, the 21st of October was, by a vote of the Society, substituted.

The Essex Historical Society in 1828 celebrated the two hundredth anniversary of the arrival of Endicott at Salem, September 6, 1628, and they selected the 18th of September as the true day, thus adding *twelve* days to represent the difference of style. Being asked, a few days before the festival, in the street, what is the difference between old and new style, Dr. Bowditch, the greatest mathematician in the country, correctly replied, in his prompt way, "Twelve days." But Dr. Bowditch afterward said, when it was too late, the question should have been, "What *was* the difference two hundred years ago?" (Savage's 'Report on the Day for Celebrating the Landing of the Pilgrims,' Boston, 1850, p. 10). The Essex Institute, the successor of the Essex Historical Society, celebrated, in 1878, the two hundred and fiftieth anniversary of Endicott's landing, and they still adhered to the day adopted fifty years before, September 18, instead of selecting the true day, the 16th; the President of the Society, in his opening address, saying they did not wish to discredit the judgment of their predecessors, nor "express an opinion on a subject that has agitated so much the minds of scholars and historical students."

When John Quincy Adams was asked, in 1843, to deliver an address before the Historical Society, on the "Confederation of the Four New England Colonies of 19th May, 1643," it at first occurred to him—perhaps from his long residence in Russia, where the old calendar is still in use—that twelve days would be required to represent the true date; but he soon saw, or was led to see, his error, and the address was delivered on the 29th (Savage's 'Report,' pp. 10, 11).

C. D.

CAMBRIDGE, MASS.

[The argument of our correspondent controverts no statement made by the *Nation*. It shows clearly enough that learned historians and societies of historians "blundered on the subject of the old and new style," and that wise persons "continue to blunder about the same thing"; all which, in view of the simplicity of the subject, is strange indeed. But the "blundering" (the candid reader will excuse the word, seeing that we take it from the pen of our much-esteemed correspondent) of Dr. Belknap and Judge Davis must not be shifted over to the Old Colony Club. That very respectable club had no occasion to "institute" the anniversary called Forefathers' Day, and consequently had no occasion to confuse the calendar. To cite Dr. Thacher's 'History of Plymouth,' second edition, 1835, page 29: "Tradition says that Elder Faunce was in the habit, on every anniversary, of placing his children and grandchildren on the rock, and conversing with them respecting their forefathers." Elder Faunce died in 1746, when in the ninety-eighth year of his age, and as he "bid an everlasting adieu" to the rock in 1741, when he is reported to have "bedewed it with his tears," his "habit" of taking his descendants thither on the *anniversary* of the landing of the forefathers was formed many years before the Old Colony Club came into existence. The club was established in 1769, in which year it "instituted" the first public celebration of Forefathers' Day in Plymouth. It had nothing to do with "instituting" the anniversary, for that, in 1769, was already a time-honored day, and had been celebrated, in a quiet way, as was his "habit," by Elder Faunce, and we know not by how many others.

Our correspondent holds that what Judge Davis "did not know about the antiquities of Plymouth was not worth knowing," and yet all the Judge's marvellous knowledge failed him in his reckoning of old and new styles. He was a Forefathers' Day orator and ode-maker, and we willingly admit that he must have known "the day he was commemorating, or the event he was commemorating." In 1813 the Massachusetts Historical Society voted to "celebrate the anniversary of the Landing of the Forefathers on the 22d of December," and elected Judge Davis to deliver a discourse. The discourse was printed, and having carefully searched its pages, we can say that it contains no mention of the "shallop" landing. On the contrary, the Judge's reference to "the little band whom we this day commemorate," points distinctly to the landing of "the whole number of the company," which he puts down as "one hundred and one." And in his "Ode for the 22d of December, composed for the anniversary festival, 1792," we find that his poetic vision was in harmony with the sentiment of his oration. We have room for one verse only of that ode:

> "By yon wave-beaten rock
> See the illustrious flock,
> Collected stand;
> To seek some sheltering grove,
> Their faithful partners move,
> Dear pledges of their love,
> In either hand."

Neither the oration nor the ode will apply to the landing of an exploring party on the 11th of December. The real question for discussion is not about the landing of the "shallop" party (we have alluded to that event, as a matter of fact, over and over), but it is whether *Forefathers' Day* commemorates the landing of a few sailors and adventurers, or a subsequent landing of the entire body of the Leyden Pilgrims—the landing from the *Mayflower*, on Plymouth Rock. Our "view" of Forefathers' Day, as it was presented in the *Nation* of July 6, has not been shaken by any quotations from Mourt, or Belknap, or Davis, or Thacher; and believing it to be the true one, we have no hesitation in reproducing it:

"Whether the disembarkation [from the *Mayflower*] was made in one day, or occupied several days, is not so material. It is the idea of a general landing of men, women, and children that has made any one day remarkable; and the stream of literature sets in one plain direction—to the 'consecration' of the landing of the Pilgrims from the *Mayflower* on the 22d of December, 1620."

—ED. NATION.]

Notes.

CHARLES SCRIBNER'S SONS send us vols. i.–xiv. of their so-called "Subscription Edition" of the 'Encyclopædia Britannica,' beautifully bound in half-morocco. The impression has been made from the original plates, and one only misses the broad page-margins; but this, while a loss to the eye, is more than offset by the greater ease in handling the at best heavy volumes. A welcome new feature of the "Subscription Edition" is a series of United States maps designed to replace those which have already appeared. Their merit does not lie in artistic engraving, but in clearness and accuracy. The selection of names of towns has been determined by the populations of the last census. The railroad lines are delineated in red—sometimes, we observe, a little in advance of the actual rail-laying, as in the depicted junction of the Oregon and California roads. Many will find the series in a detached form convenient. Of the latest volume, the 14th, we must take another occasion to speak in detail.

A work of no ordinary interest, 'The Letters of Lydia Maria Child,' with a biographical introduction by J. G. Whittier, and an appendix by Wendell Phillips, is in the press of Houghton, Mifflin & Co.

Harper & Bros. will have ready next month Mr. Wm. H. Gibson's 'Highways and Byways,' with his own illustrations; and in October, Mr. Abbey's illustrated Herrick.

The second volume of Mrs. Stanton's 'History of Woman Suffrage' will be published immediately by Fowler & Wells.

G. P. Putnam's Sons' fall list embraces 'Social Equality: a Study in a Missing Science,' by W. H. Mallock; 'The Development of Constitutional Liberty in the English Colonies,' by Eben G. Scott; 'The Political Conspiracies preceding the Rebellion, with the true stories of Fort Sumter and Fort Pickens,' by Lieut.-Col. Thomas M. Anderson; 'Six Months in Persia,' by E. Stack; 'Travels and Researches among the Lakes and Mountains of Eastern and Central Africa,' by J. Frederick Elton; 'A History of English Prose Fiction,' by Bayard Tuckerman; 'Songs of Lake Geneva, and other Poems,' by John Brayshaw Kaye; 'Sheaves,' a volume of poems by Harriette Converse; 'A School Atlas of Astronomy,' by A. Keith Johnston; a second series of 'Best Reading,' for the five years ending December 31, 1882, edited by L. E. Jones; and a curious symposium, 'How to Succeed,' to which Senators Bayard and Edmunds, novelists, soldiers, politicians, and inventors contribute their experience—shall we say?—or belief.

Houghton, Mifflin & Co., in issuing the complete 'Poems of Thomas Bailey Aldrich,' have taken exceptional pains with the illustrations, which for the sake of harmony have been executed by members of the Paint and Clay Club of Boston, in mutual understanding and criticism. Mr. W. B. Closson engraves two of his own designs.

Père Didon's lectures on 'Science without God,' translated by Rosa Conder, will be issued in September by T. Whitaker.

Macmillan & Co. have repurchased from Henry Holt & Co. their "Elementary Classics," of which a list was given in last week's *Nation*.

Wentworth's 'Elements of Algebra,' with the addition of half its bulk devoted to the discussion of subjects usually found in the higher algebras, will compose his 'Complete Algebra' promised immediately by Ginn, Heath & Co.

We receive from Ithaca, N. Y., a 'Bibliographia Psiupsilonica,' issued by the Chi Charter—a small pamphlet of seventeen pages, compiled, doubtless, by Prof. Willard Fiske, of Cornell. Its fifty-eight numbers are pronounced nearly complete.

A bibliographical list of the English translations and annotated editions of Goethe's *Faust*, compiled by William Heinemann, is begun in the August *Bibliographer* (J. W. Bouton). The

same number reviews a work by J. H. Hessels, 'Gutenberg: Was he the Inventor of Printing?' to which Dr. Van der Linde's reply will be interesting reading.

A sketch of the late Stephen S. Foster, by Parker Pillsbury, is printed in the current number of the *Granite Monthly* (Concord, N. H.).

Mr. Christern will receive subscriptions for a charming art-work, on the Estense Gallery at Modena, by Inspector Venturi, who in the text will trace the origin of this collection, and its varying fortunes of war and of necessity, with the aid of fine illustrations.

The widow of Professor Cairnes is desirous of obtaining copies of his letters, many of which were written to friends in America. She will be very grateful to any correspondent of her late husband who will send such copies to her, or the originals, which she will carefully return after making copies of them. Address Mrs. Cairnes, 46 Oseney Crescent, London, England.

—Our endeavor last week to explain briefly a technical term in the extract from Minister Marsh's letter from Vallombrosa was not quite successful. *Ueberwallung*, in its dendrological sense, of which the common dictionaries take no cognizance, means "the covering over with a growth of bark the top of the stump of a tree which had been entirely cut down; this growth being formed without the aid of leaves, and so without the elaborated sap on which the formation of wood largely depends." The phenomenon is of very rare occurrence, and the writer has never witnessed it in this country.

—"A Summer at York," by Sara D. Clark, and "Spanish Vistas—Mediterranean Ports and Gardens," by George P. Lathrop, are the chief illustrated articles in *Harper's* for September. They will be found worth reading as well as looking through, both having some literary as well as pictorial value. Mr. Lathrop gives an account of a gypsy dance, the *flamenco*, as danced in Malaga, which seems to have the peculiarity of being an Oriental dance performed in Western costume. Two other illustrated articles are "The Weibertreue," by Elise Allen, and the "Visit of the Vikings," by T. W. Higginson, whose conclusion with regard to the Vikings' visit to this country—that there is very little hope of ever identifying a single spot where they landed, or of ever being sure of anything about it beyond the bare fact that they came here before Columbus did—is one not likely to be quarrelled with. "In Surrey," by Mrs. John Lillie, is founded partly on a trip to that county and partly on Madame D'Arblay's Memoirs. For more serious contributions, Mr. Edwin P. Whipple writes on Emerson, and dwells a good deal on a trait which many of his disciples failed for very good reasons to notice—his humor. This serves to explain, or half explain, a good many things that have passed with the untranscendental for pure extravagance or nonsense. We should be inclined to doubt whether his "Nay, Margaret, it is religion," was said with the entire seriousness that is always attributed to it, and certainly it would be unsafe to take Margaret Fuller's word for it. David A. Curtis contributes an article on "The Mississippi River Problem," in which no attempt, however, is made at a solution of the stated problem, "how to keep within fixed bounds a stream that flows in varying volume over a bed of mud, without banks that can be called banks." It is at present one of the grandest fields for the theorist and for an appropriation in the world. The Mississippi River Commission, a body created by the Forty-sixth Congress, believes in keeping the river within bounds by artificial means, and proposes to narrow the river to a uniform width of 3,000 feet, to strengthen the banks, and regulate the shape of the bottom. The critics of this plan say that it cannot be done—that the river must overflow, and that the proper thing to do is to provide auxiliary channels and outlets which shall guide the surplus water to the sea. The cost of the work of the Commission has been put by one of its members at $33,000,000, while its critics say that $460,000,000 would not complete it satisfactorily. The poetry of the number consists of "A Garden Secret," by Philip Bourke Marston; and "Marit and I—a Norse Idyl," by Hjalmar H. Boyesen. Mr. William Black's "Shandon Bells" is continued, and Mr. Curtis contributes two or three graceful essays in the "Easy Chair," the best of them being on that universally conceded American good nature which leads us in travelling and elsewhere to submit to so many impositions that Englishmen cannot be brought to endure.

—The September *Century*, like the other September magazines, is stronger in prose than poetry. Mr. S. G. W. Benjamin contributes an illustrated article on ocean steamships, which brings out in a striking way the extraordinary reduction in the length of ocean voyages effected within the past generation by the introduction of the screw, the compound engine, and the increased size of steamers, and in which he calls attention to the curious fact that stern-propulsion, suggested by the earliest inventors of the marine steam-engine, is, after many experiments, and a long trial of lateral propulsion, the plan upon which the world has finally settled down for marine navigation. Other illustrated articles are "The Original of Rebecca in 'Ivanhoe,'" in which Mr. Gratz Van Rensselaer shows by what seems very conclusive evidence that the idea of the daughter of Isaac of York was suggested to Sir Walter Scott by Irving, through the account given by the latter to the novelist of a certain Rebecca Gratz, a Philadelphia Jewess; "An Old Town with a History" (Castine, Maine), by Noah Brooks; "The Academic Career of President Woolsey," by Prof. George P. Fisher, an article of some intrinsic biographical value; "Dante Gabriel Rossetti," by Edmund W. Gosse, who adds a detail here and there to our knowledge of a very singular man—singular, among other things, in the fact that his mediævalism in art and poetry was not, as was the case with others of his time, the result of study or reflection, but a pure case of what Darwinians would call reversion, for his imagination, born in an English and modern and utilitarian and formal *milieu*, had a distinctly Italian and mediæval character; and "Ningpo and the Buddhist Temples," by Constance F. Gordon-Cumming. The serials go on as usual, and there are two or three serious and critical articles, as well as a short story by Joaquin Miller. Mr. E. V. Smalley's second paper on the "New Northwest" is a very good bit of description, in which he points out what he thinks is a radical difference between the railroad and the pre-railroad genesis of towns in the West. "Formerly the country was settled first, and the towns grew up to supply the needs of the rural population. Now the towns are created by speculators far in advance of the farming settlement; and by the conveniences they afford for selling crops, and buying implements, lumber, and household supplies, they attract farmers to their vicinity. Each new frontier town is an advertisement of the surrounding country, upon the settlement of which it must depend for its existence." As an instance of this process, he cites the town of Billings, on the Yellowstone, where the bare prairie was staked out with streets, avenues, and parks on a scale for a city of 20,000 inhabitants, a "Billings boom" was started in the real-estate market, and blocks in the new city were sold in Chicago and New York. Within sixty days after Billings had been born, $220,000 worth of lots had been sold within its imaginary limits. The town of Duluth was, if we remember right, placed on the market in much the same way, but in such speculations the chances of a financial crash have to be taken into the account, and 1873 was too much for Duluth. General McClellan writes a very inconclusive article on "The War in Egypt," and Mr. Howells a pleasant essay on Mark Twain, an engraving of whom makes the frontispiece of the magazine. Mr. Howells somewhat exaggerates the importance of Mr. Clemens in literature, for although we may be ready to grant all that is said of his native powers, the use to which he puts them is, in estimating his literary rank, a serious matter. Mr. Howells thinks that Mark Twain will last. "All fashions change," he says, "and nothing more wholly and quickly than the fashion of fun; as any one may see by turning back to what amused people in the last generation; that stuff is terrible. As Europe becomes more and more the playground of Americans, and every scene and association becomes insipidly familiar, the jokes about the old masters and the legends will no longer be droll to us. Neither shall we care for the huge Californian mirth when the surprise of the picturesquely mixed civilization and barbarism of the Pacific Coast has quite died away; and Mark Twain would pass with the conditions that have made him intelligible, if he were not an artist of uncommon power as well as a humorist." We wonder what Mr. Clemens himself would say to this. Mr. Smalley, by the way, contributes a new Western waiter story, which might have come out of Mark Twain. The waiter inquires patronizingly of the guest if he is hungry, and on the guest's replying that he is, "I am glad of it," says the waiter; "I like a hungry man."

—Mr. Austin Dobson's illustrated paper on "Thomas Bewick," with which the *Century* opens, has not only the literary finish we expect from this writer, but also the merit of orderly exposition and of a certain originality. Mr. Dobson has visited the engraver's birthplace and his haunts in country and city, and compares his impressions with those recorded by Bewick in his autobiography. He shows us in modern woodcuts what remains of Cherryburn, the Ovingham parsonage and church, with its memorial tablets, the Newcastle workshop of Bewick & Son. Then, proceeding to trace the artist's career, he settles a moot point concerning his early work for Saint's 'Select Fables' in 1776. The rest is for the most part not new, excepting a few details of considerable personal interest. Add to all this twenty specimens of Bewick's art, the largest one being printed from the original block. We have examined these somewhat curiously to see whether they have gained or lost by the *Century's* presswork. It is well known that when Bewick had mastered the difficulties of engraving on wood, he had to overcome the printer's inability to deal with cuts, for an instance of which take the twelfth edition of Croxall's 'Æsop,' printed for the foremost houses in London in 1782. He accordingly lowered the surface of his blocks in such a way that the darker portions protected the lighter against the rough usage of the press, while the proper effects of light, shade, color, and distance were preserved. We could criticise the *Century's* prints more intelligently if we knew which of them were recut and which reproduced by "process"; but we have not found one of them superior to the originals, while, what is most singular, the loss of "atmosphere" is ap-

parent in several (*e. g.*, "The Farmyard," the tail-piece to "The Beaver," and "The Common Snipe"). The prevailing defects are that the absolute blacks are made grays, though in "The Starling" the black of the head is ruinously overdone and extended; and that the finer details are often half or wholly obliterated (see especially the two owls). This last is bad enough when the background is in question, but when plumage is involved the effect is meagre on the one hand and mussy on the other. We apprehend that the ink has something to do with the matter; but, without disparaging the pressman or the ever-watchful supervision of him, we incline to think that Bewick's work will suffer more by excess than by neglect of "overlaying." On the whole, Mr. Dobson's favorite "Old English Hound" comes off best.

— The *Atlantic* for September has a very small supply of poetry—a sonnet to "Darkness" by Julia C. R. Dorr, and three verses called "Tears of Isis" by Francis L. Mace, being all. R. Fellow contributes an article on "American History on the Stage," in which he suggests one or two subjects for serious treatment; among others, the expedition of Sir William Phips against Quebec, and the life and death of John Brown. Nobody can say that a subject is not a good one till it has been tried, but we confess that to our minds it is difficult to imagine anything of importance being done with either. History is the stumbling-block of the playwright. Picturesque, romantic, and dramatic incidents in it attract and delude him at the same time. The best proof of this is that very little really good historical drama has ever been written. The great Greek tragedians employed legend rather than history as the groundwork of their drama; the French classical school took classical subjects as far as possible. Shakspere wrote "histories"; but they can hardly be said to have held the stage. The romantic drama of France, of which "Hernani" may be taken as a type, made use of historical names, but hardly came much nearer actual history than does such a play as "Adrienne Lecouvreur." It must be remembered that in Shakspere's time the drama performed a good many functions which fall to literature now. Audiences which came to see "Henry V.," for instance, came to have the story told them. This they would now get out of a book or a magazine. The modern familiarity with history, the fact that every American boy, for instance, learns the history of his country at school, is a reason the more for thinking it unadapted to dramatic representation. Nobody who could get hold of Parkman's delightful volumes would care to go to see *Sir William Phips* or *Frontenac* given by a star actor at the Grand Opera House, or even at Booth's. Another reason why American history seems to make poor material for the drama is that many of its most serious persons and events have been turned into general ridicule and have had an air of burlesque thrown over them by a variety of causes, which need not here be gone into, but which have permanently impaired their gravity. Washington on any stage would be a failure. They do these things better in France, and they made the experiment there and failed. Against one thing it is safe to warn the playwright—that is, against attempting to write historical drama as such. Let him try producing a good play, and, if it turns out to be historical too, no one will have a word to say. If it is bad, its historical character will not help it. Elizabeth Robins writes on "Evil in the Greek Mythology," and shows how different a part evil plays in mediæval Christianity:

"'From Harz to Hellas, cousins we discover!' cries Mephistopheles. There were in Greece creatures as grotesque, as improbable, as hideous as any to be found in India or in Scandinavia. There were dragons with seven heads, and great giants with but one eye in the middle of their foreheads. Strange beings—partly birds, partly women—haunted hill and valley, and the calm blue sea concealed terrible monsters. At first it seems as if sirens and lamiæ, griffins, hell-hounds, and cyclopes must be the same in every respect as the asuras of the East, or the grotesque demons of mediæval Europe, whom they resemble in outward form. But they are in reality as distinct from them as classic is from Oriental and romantic poetry. Goethe, in pointing out the likeness, has also analyzed the difference between Greek and Northern demons. This dualism has never been so tersely explained as when he makes Mephistopheles, on the mountains of Hellas, miss the smell of pitch and brimstone, to which he is accustomed on the Blocksberg, while he wonders what can be the nature of their hell-fire."

—Another instalment of "Studies in the South" contains a discussion of what is being done for the education of the negro. Mr. Harrison criticises the plan of national aid, which he thinks would be a positive evil. The poverty of the Southern States is not, he says, so great as to render it at all necessary, and it is very desirable that both whites and blacks should be accustomed and remain accustomed to a full local responsibility for the results of ignorance if they permit it. Mr. Harrison, it should be said, is very sceptical on the subject of common-school education. What the negroes need, he thinks, is industrial and moral training. These the public schools do not give. The negroes must, of course, be taught the rudiments of knowledge—reading, writing, and arithmetic. But what they must actually do in life is work, and nothing taught them at school ought to produce a dislike in them for manual labor. They are "serfs," says Mr. Harrison bluntly, and serfs they must remain, and it is mere cruelty to give them an education such as Northern common schools furnish, which "tends very generally to produce in the pupils a dislike of manual labor, and a disposition to regard those who live by it as an inferior class." Alexander C. McClurg contributes a readable war article called "The Last Chance of the Confederacy," and the three serials are carried bravely forward by Mr. Hardy, Mr. Bishop, and Miss Phelps. They are all three full of character. Doctor Zay is the most tremendous woman doctor that has yet appeared in fiction. Swithin St. Cleeve as the lover of science cannot be matched anywhere, and for fastness it would be hard to beat young Kingbolt, of Kingboltsville. Mr. F. H. Cushing's "Nation of the Willows" is interesting and valuable, as everything he writes about the Indians is.

—*Lippincott's* for September opens with an illustrated article describing "An Antwerp Printing House," by Rose G. Kingsley. Amelia E. Barr contributes an article on "Songs that have Made History," such as "Lillibullero," "Ça Ira," and the Marseillaise, but her material is very well worn. A curious collection might have been made of the songs that were popular in our Army and among the rebels during the war, as well as of the songs which it was attempted to nationalize here without much success. As music the successful and popular songs had little value, except in the case of one or two old and familiar tunes. All of them were extremely simple melodies. "John Brown's Body," and "Maryland, My Maryland," and "Marching through Georgia," and "Dixie" were those which probably had most moral military effect; but we fear the result of the examination would show us to be a most unmusical nation. The current instalment of "Fairy Gold," a novel published anonymously, is not at all bad, and there is further provision of fiction in the form of short stories—"Guy's Legacy," by William O. Stoddard, and "Mrs. Witherell's Mistake," by Edward Lassetter Bynner. "Animal Electricians," or in other words animals provided with "stored" electricity, such as the torpedo and the electric eel, are written about by C. F. Holder. Octave Thanet gives an account of a trip "Through Great Britain on a Drag," which seems to be that noticed in the newspapers some months ago as having been taken by Mr. Andrew Carnegie and his friends. Mr. Charles Wood gives an account of his invasion of the "Temple of Heaven" in Peking, and A. Granville Bradley gives some valuable information about a most interesting part of Virginia in an article called "Round about the Peaks of Otter." Louise Chandler Moulton and Mary B. Dodge furnish the poetry of the month in "At War" and "Interchange." In "Our Monthly Gossip" we always find some extraordinary statement. This month it is the suggestion that hospitality is dying out. We should like to be informed where. Is it in Philadelphia, and is the phenomenon connected in any way with protection to American industry?

—Mr. Clarence Cook has a very depressing article in the current number of the *North American Review* on "Architecture in America." The only houses in the country which satisfy him are the "cottages and small houses of the last century" scattered over eastern Massachusetts and "found plentifully in New Jersey." As far as we understand what he says, the reason why these are good specimens of architecture is that when they were built there were no architects in America. "The general excellence that marks the dwellings of any people is a proof of the non-existence of professional architects among that people"; and conversely, "when architects abound the art of building always deteriorates." Again: "It is to architects that we owe all the ugly building that offends us in our large cities and in our country towns and fashionable summer quarters." So far all is plain sailing. Before there were any architects there were, of course, nothing but builders, and it is to the honest, unpretending builder that we owe all the good early Colonial structures that Mr Cook finds so satisfactory. This is something like the view that Carlyle took of the matter, as may be seen in his lamentations over the decay of the art of masonry, in which his father was such a proficient. But in the next sentence Mr. Cook destroys the whole fabric of his argument by declaring that "it is to architects that we owe, nowadays, the few, the very few, buildings on which our eyes can look with pleasure," and he adds that "the work of the professional builders is always in these days an eye-sore." It is easier to follow Mr. Cook when he does not generalize, and when he tells us what he thinks of particular buildings. He has surveyed the field, and has found very little that is good in it. For instance, there are "the churches on the Back Bay lands" in Boston—one "with the foolish frieze of sculpture encircling the lofty, awkward tower, and wholly unintelligible from below," another with "the completest Saratoga trunk" on top of it; for what purpose placed there Mr. Cook does not know, and the Art Museum, "so finikin fine, with its heads of great men, looking out of portholes in the most shipwrecked fashion." The same extravagance we find repeated in the Sanders Theatre at Cambridge and in the Historical Society's building in Brooklyn. The Boston Art Museum and the Memorial Hall at Cambridge are, it seems, "examples of what comes of building getting into the hands of literary, critical men, art students, with their heads crammed full of remembered bits of Old-World architecture, and their portfolios stuffed with photographs of more and more bits." As for the Vanderbilt houses, the two built by Herter and

the third built by Mr. Richard Hunt—what are they? The art of architecture, it seems, "has not received many worse blows in this country" than have been given her by these three houses. Of Mr. Hunt, Mr. Cook says he "has certainly loaded earth with some of the most ungainly among all the ungainly structures that make our streets such a misery to any one who cares for good building." He "spoiled quiet Beacon Street" by the erection of what Mr. Cook cautiously says he "believes" to be "the ugliest house that has ever been built this side the Atlantic"; and he built the Lenox Library, too, "with its silly pediments and blank monotony of wall." No wonder such a man as this should have built the third Vanderbilt house, "a patchwork made up of bits." This is certainly a gloomy picture; and the worst of it is that there seems to be no chance for anything better, for reform must come either from builders or architects or students of art, and for all three classes Mr. Cook has the profoundest contempt. After reading the article we can only say, Alas! alas! there is no hope. Other readable articles are "Tornadoes and their Causes," by T. B. Maury, and "Earth-Burial and Cremation," by Augustus G. Cobb. Mr. Cobb quotes an eye-witness as giving the following pleasant account of the spectacular effect of crematory funeral: "When, in obedience to his own dying request, I saw the door of the cinerator taken down, its rosy light shine forth, and his peaceful form, enrobed in white, laid there at rest amid a loveliness that was simply fascinating to the eye, and without a glimpse of flames or fire or coals or smoke, I said, and say so still, this method, beyond all methods I have seen, is the most pleasing to the senses, the most charming to the imagination, and the most grateful to the memory."

—The Norwegian Edmund Neupert, now on his way to America for the purpose of giving concerts in our larger cities, is a pianist of the first rank and a composer of considerable merit. He is in the prime of life, having been born on the first of April, 1842. He received his first lessons in music from his father, Hermann Neupert, a music-dealer and teacher of the pianoforte in Christiania, Norway. He played in public concerts at the age of seven with marked success, and in 1858 he was sent to Berlin, where he received further instruction from Professor Kullak. Here he soon became a favorite in the best musical circles, and at the age of twenty-two he appeared in the "Singakademie," and was received with favor. By invitation of Gade he became a teacher in the Copenhagen Conservatory of Music in 1866. He has repeatedly given concerts in the largest cities of Germany and Scandinavia. In 1880 Neupert was called to a position in the Musical Academy of Moscow, Russia, where he was greeted with great applause. After the death of Nicholas Rubinstein, at whose request Neupert had gone to Moscow, he returned to Christiania, where he has established a music school. If we except Erika Lie, who is a famous interpreter of Beethoven, Neupert is unquestionably the most brilliant piano virtuoso the Scandinavian countries have produced. Among his compositions his six "Improvisations" on Norse themes are perhaps the best known and most popular. His "Études" are also frequently found on concert programmes.

—In an interesting essay on the connection between Arthur Schopenhauer's philosophy and personality, in the July *Rundschau*, Professor Paulsen certainly proves that Schopenhauer's peculiar philosophy was the direct outcome of his private convictions, and that theoretically as well as practically he was the pessimist *par excellence*. He was the most distrustful of human beings.

"He believed in no man's honesty, not even the commonest, every-day sort. Just as he feared that his own mother and sister wanted to take advantage of him, so he did in the case of all his friends. A friend of his youth, a Frenchman, who had shown sincere devotion for him, was asked by Schopenhauer for advice concerning a projected investment in a French life-insurance company. His friend dissuaded him, and offered to invest part of the capital in his own business. Schopenhauer never answered the letter, but wrote on the margin: 'Do you smell a rat?' (*merkt Du was*). For a similar reason he received an extremely painful rebuke from his publisher, Brockhaus. After having sent him the manuscript of the first edition of 'Die Welt als Wille und Vorstellung,' he could not shake off the suspicion that Brockhaus wanted to defraud him of his payment. He accordingly wrote him a tolerably impudent letter, adding that he understood the firm to be generally unreliable as far as payment was concerned. Brockhaus asked him to name a single instance in which he had failed to meet his obligations, saying that otherwise he could no longer consider him a man of honor. Schopenhauer had to swallow the reproach, and Brockhaus broke off all further connection with him."

—His valuables were so carefully hidden that in spite of the Latin direction contained in his will it was difficult to discover them. After his second journey in Italy he kept his account-book in English, and important business notes he wrote in Latin and Greek. In order to be safe from thieves he wrote deceptive labels, calling bonds *arcana medica*, keeping coupons in old letters and among sheets of music, and gold coins under the inkstand in his writing-desk. Altogether, Schopenhauer knew well how to take care of his own. A large part of his money, as well as that of his mother and sister, was invested with a commercial house in Dantzic, which in 1819 became insolvent. All the creditors lost seventy per cent. of their claims; Schopenhauer alone, by skilful threatening and bullying which would have done credit to any lawyer, managed in a few years to recover his capital with interest added. Schopenhauer, like most eminent men, seems to have inherited a fair share of his temper from his mother, one of the prosiest of novel-writers, who exchanged with her son such genial epistles as the following: "You may dine with me on my reception evenings provided you can abstain from your troublesome disputing, which always puts me out of humor, as well as from all lamentations over the stupid world and human misery, which never fail to give me bad dreams, and you know I like to sleep well."

LECKY'S HISTORY OF ENGLAND IN THE EIGHTEENTH CENTURY.—II.

A History of England in the Eighteenth Century. By William Edward Hartpole Lecky. Vols. III. and IV. London: Longmans; New York: Appletons. 1882.

THE key to Mr. Lecky's theory of our Revolutionary struggle may be found on page 113 of vol. iv.:

"The American people, though in general unbounded believers in progress, are accustomed, through a kind of curious modesty, to do themselves a great injustice by the extravagant manner in which they idealize their past. It has almost become a commonplace that the great nation which in our own day has shown such an admirable combination of courage, devotion, and humanity in its gigantic Civil War, and which since that time has so signally falsified the predictions of its enemies, and put to shame all the nations of Europe by its unparalleled efforts in paying off its national debt, is of a far lower moral type than its ancestors at the time of the War of Independence. This belief appears to me essentially false."

While, therefore, Mr. Lecky sympathizes, on the whole, with the results of the Revolution, and pays a hearty tribute to the character of some of its leaders, the general tone of his book is that of depreciation at once of the American people of that day, and of the acts of aggression which led to the Revolution.

Nothing is easier than to make a plausible showing on at least the first of these. In any popular movement the good and the bad are so intermixed that it depends entirely upon what eyes we look with, whether we approve or condemn. The reader of Macaulay wonders how a revolution carried through with such venality and half-heartedness as that of 1688 can have been a "glorious" revolution. What meanness and hypocrisy one meets at every turn in the revolution of 1640. Mr. Lecky eulogizes the spirit and character of the American people in the time of the Civil War; but the noble army of contractors, the chronic grumblers, and the venomous Copperhead, gave occasion to lamentations and discouragement quite equal to any that he quotes from the correspondence of Washington and Adams. Times of revolution bring out all the heroism of a people, but they also place its low and evil traits in a glaring light.

When we pass to the other question, the provocations to the Revolution, and its justification, it is certainly true that the oppression exercised by England was not of the kind that drives men to madness. But is not this fact, in view of the almost unanimous feeling that existed at first against separation, even on the part of those whom Mr. Lecky calls "demagogues" (Otis, the Adamses, etc.), the clearest evidence of the loftiness of spirit with which the colonists entered into the struggle? It was only the assurance that they were contending, not for threepence a pound on tea, but for the principle which lay at the foundation of English liberties, that could have inspired them to a resistance which seemed so desperate. The American Revolution finds its fullest justification in the present policy of the British Government in dealing with its colonies—a policy forced, we may say, upon the mother country by the success of the American Revolution.

Excellent as is Mr. Lecky's analysis of the causes of the Revolution, he wholly fails to appreciate, or at least to bring into due prominence, its relation to the colonial system. This subject it is, we believe, Mr. Bancroft's merit to have first elaborated, but, after all, Colonel Barré's speech, familiar to every schoolboy, contained the gist of it. It was urged, and Mr. Lecky urges, that the contributions called for from the American colonies were far from being their fair proportion of the expenses incurred by the war from which the colonies had so largely profited. And this is very true, if we could consider the colonies as really forming part of the British Empire, and the war as waged in their behalf. But it is manifest that this was not the case; that the colonies were planted and administered as pure dependencies, for the sole profit of the mother country. Of course all prosperity which fell to the lot of the mother country could not fail to redound in some degree to the benefit of the colonies; but this was no part of the plan. From the passage of the Navigation Act of Charles II. (that of Cromwell was conceived in a different spirit, and treated the colonists as *Englishmen* of equal rights), the colonies were systematically forced to make their industry subservient to the interests, not of *England*, but of English manufacturers and merchants. Mr. Lecky says (vol. iii., p. 372) that the restrictions upon manufactures were "of no great consequence to a country where agriculture, fisheries, and commerce were naturally the most lucrative forms of enterprise"; but nothing is more certain than that, except for these restrictions, the natural inventiveness and enterprise of the New Englanders would

have made manufactures a "lucrative form of enterprise" long before the Revolution. With good reason, the Americans felt that it was an impertinence to require them to contribute to the expenses of the Government when they not only were unrepresented in its counsels, but were treated by it as only a source of profit. Moreover, if it was right that the colonies should be taxed for the benefit of the Empire, it was right that they should be made an integral part of the Empire; and this step should have come first. No doubt it would have been a matter of great difficulty to arrange the details of such a union —perhaps it would have been impossible. The first great attempt, Franklin's scheme of union, in 1754, failed; but, at any rate, wise statesmanship would have made fresh efforts, and would have been willing to wait indefinitely, rather than insist upon raising money by taxation from a community which stood in no organic relation to the British Empire except that of subjection.

Compared with the injustice of the colonial system, the legal argument as to the right of the Crown or of Parliament in the colonies is of very secondary importance. No doubt, the colonists did shift their position from time to time, as the inherent injustice of the system became more strongly impressed upon their minds. It was at first only internal taxation that they resisted; then external taxation; then the right of legislation. This was inconsistent, perhaps; but, after all, they proceeded by logical steps. Nothing would have satisfied them in the long run —and nothing ought to have satisfied them—except either an integral union with the British Empire or such complete administrative independence as is now enjoyed by Canada and Australia. As, therefore, they understood the injustice of their economical relations as clearly as Adam Smith and Turgot, so they, by a prophetic instinct, led the way to the present colonial policy of Great Britain. We are told that even at that time the British colonial policy was far more liberal and just than any other. No doubt; and no wonder the routine British statesmen could not comprehend the attitude of the colonists. So much the more must we honor their clearness of view and their readiness to devote themselves for a principle which is now recognized and unquestioned.

Mr. Lecky's failure to appreciate the importance of the colonial system as a cause of the Revolution gives to his whole discussion a certain one-sidedness in tone. He believes that the Americans were right, and that their triumph was the triumph of constitutional liberty. He sees this clearly now, in the light of events; but he cannot understand how the American leaders could see it a hundred and twenty years ago. The English statesmen—except Burke and a few others—thought it clear that the colonies should contribute to the burdens of the war; and it seems to him strange that the colonists should have thought differently. The result is a curious inconsistency: the *opinions* are generally favorable to the American cause, the *tone* generally unfavorable. The Boston Massacre affords a very good illustration of this. After an account at considerable length of the unreasonableness and insubordination of the people of the colonies, and especially of Massachusetts (vol. iii., p. 397), the so-called massacre is described, and its effects dwelt upon, in exciting the passions of the people and alienating them still further from the mother country. The impression given is almost that of a reign of terror; and when we read directly after of the trial of the soldiers, their defence by Adams and Quincy, their acquittal, and the complete acquiescence in this acquittal by the American people (including the election of Adams as representative for Boston), one cannot but feel that the previous account was somewhat exaggerated, or, at any rate, that the author fails to understand the real sentiment of the community. And when he proceeds to ascribe this result solely to the "humanity" of the American people, we feel that he totally misapprehends the situation. It was a far nobler thing than sentimental unwillingness to shed blood: it was a sense of justice—a readiness to understand the requirements of the law and to acquiesce in them.

We have pointed out what seems to us the principal defect in Mr. Lecky's view of the American struggle, in his failure to go behind the mere question of law and to comprehend the position of the Americans as a people. In his account of the War he has brought out with great fulness—possibly with some exaggeration —the weakness of the American cause, the strength of the loyalists, the lukewarmness of the majority of the inhabitants, the shortcomings of the administration. It would almost seem as if he wished to show, as M. Taine has shown for the French Revolution, that the movement was pushed through by a resolute and unscrupulous minority. But an essentially democratic country like America, in which local self-government was carried to its furthest point, cannot be compared with a centralized despotism like France. No doubt, as Mr. Sabine and others have shown, the strength and respectability of the loyalist element were much underrated in the first years of the Republic; but we think it certain that in most of the colonies a large majority was in sympathy with the Revolution.

The military history, as might be expected in a work of this character, is the least complete part of the history of the Revolution. On the other hand, the political and financial portions are very well handled; the sketch of the powers of the Continental Congress (vol. iv., p. 33) is especially good. We find on page 12 of vol. iv. the strange statement that in 1776 "Congress, without absolutely superseding [Schuyler], gave the supreme command to Gates, who was by birth a New Englander." Schuyler offered to resign at this time, but his resignation was not accepted by Congress; it was a year later that he was superseded by Gates, who was an *Englishman* by birth. Again, on page 63, it is said that Carleton was, in 1777, superseded by Burgoyne. Here, too, Carleton had offered to resign, but was left in his original command in Canada, while Burgoyne advanced to the South. Charlestown, near Boston, is regularly called "Charleston," and Dickinson is spelt "Dickenson."

BOOKS ABOUT THE STAGE.

Mrs. Duff. By Joseph N. Ireland. With Illustrations. [American Actor Series.] Boston: James R. Osgood & Co. 1882. 12mo, pp. 188.

Great Artists of the American Stage: a Portrait Gallery of the leading Actors and Actresses of America, with Critical Biographies. By Alfred Trumble. New York: Richard K. Fox. Part I. 8vo, pp. 73.

Un Dossier: "La Fiammina" contre "Odette." Par Mario Uchard. 1882. Paris: Dentu; New York: F. W. Christern.

Mémoirs de Samson, de la Comédie-Française, avec un portrait dessiné par G. Jacquet. 1882. Paris: Ollendorff; New York: F. W. Christern. 12mo, pp. xxi.-338.

L'Odéon: histoire administrative, anecdotique et littéraire du Second Théâtre-Français. Par Paul Porel et Georges Monval. Paris: Lemerre; New York: F. W. Christern. Vol. I. (1782–1818). Pp. 355.—Vol. II. (1818–1853). Pp. 397. 1876, 1882.

Vor den Coulissen. Original Blätter von Celebritäten des Theaters und der Musik. Herausgegeben von Josef Lewinsky. Zweiter Band. Berlin: A. Hofmann & Co.; New York: B. Westermann & Co. 1882.

Mr. Joseph N. Ireland is honored by all students of the history of the theatre in these United States as the author of the admirable 'Records of the New York Stage,' the two ample and accurate volumes of which come down to the end of 1860; and they cannot but wish that Mr. Ireland had preferred rather to give them a third volume, covering the score of years and all the changes between 1860 and 1880, than to tell anew and at length the story of the life of a single actress, even though she were as great an artist as Mary Duff. It is a curious commentary on the prevailing ignorance of the highly honorable history of the earlier American stage that the general reader, however fond he may be of the theatre, probably never heard of Mrs. Duff before. Hence Mr. Ireland's assertion that she was a great actress, the equal of Fanny Kemble and Charlotte Cushman, and unsurpassed by any who have come later, excepting only Rachel and Ristori, will take most persons by surprise. No one, however, who is versed in American histrionic memoirs can doubt that this assertion is well founded. Mrs. Duff was a great actress. As a woman she held on our stage a position like that held by Cooper as a man. But Cooper was a man, and with careless strength held his own to the end of his life; so it happens that some memory of him survives, though his biography is still unwritten. Mrs. Duff, was a woman lacking in self-assertion, and with a large family, and at the height of her powers she left the stage and hid herself in religious seclusion; so that recollection of her artistic powers naturally faded away. It is well that Mr. Ireland has taken such great pains to trace her career. His investigation has been thorough and his narrative is simple and straightforward. There is in it none of that convenient omission and ignoring of dates which make many theatrical biographies most exasperating. There are lists of parts acted by both Mr. and Mrs. Duff; there are two portraits of each; there is a facsimile of Mrs. Duff's autograph, and there is a view of the Federal Street Theatre, Boston, in which Mrs. Duff had many of her greatest triumphs. It may interest some not specially interested in the stage and in stage folk to be told that she was the elder sister of the Miss Elizabeth Dyke whom Tom Moore married, and that Mr. Ireland thinks it was Mrs. Duff, then Miss Mary Dyke, to whom the poet was first attracted, and to whom he addressed the well-known lines:

"Mary, I believed thee true."

A word of special praise is due to the very full and unusually accurate index provided by the editor of the series.

Mr. Trumble's pamphlet contains brief biographies of thirty actors and actresses seen of late years on the New York stage, accompanied by wood-cut portraits engraved from photographs; and it is apparently a reprint from some weekly paper. The photographs have been well chosen generally, and they are engraved boldly, if not delicately: most of them are good likenesses, though there are a few hopeless caricatures. The biographical sketches are not ill done, though they contain little that is new. In the main they are fairly accurate, but we observe a few unfortunate slips, like that on page 19, where Miss Clara Morris is said to have made a hit in the "Geneva Cross," in which the chief part was acted in reality by Miss Rose Eytinge. Misprints are also more frequent than they need be. "Coleman" for Colman, and "Monte Christo" for Cristo (both on p. 21), "John Hollinshed"

for Hollingshead (p. 34), "Sangarelli" for Sangalli, and "Woolcroft" for Moorcroft (p. 47), etc. We believe that the assertion (p. 60) that Mr. Bret Harte derived his play "Two Men of Sandy Bar" from his novel 'Gabriel Conroy' is wholly unfounded. But altogether Mr. Trumble's work is better than might be expected from its rather glaring and gaudy appearance.

M. Uchard's pamphlet is an accusation of plagiarism in due form. In it M. Sardou is charged with having taken the vital situations of "Odette" from "La Fiammina," and M. Uchard remarks that various critics have declared that "Divorçons" was inspired by "Brutus lâche César"—an old play known to the English stage in Charles Dance's very skilful adaptation called "Delicate Ground." M. Sardou has filed a plea of confession and avoidance: "Odette" is like "La Fiammina," but "La Fiammina" was like earlier plays, and he who seeks equity must come with clean hands. It is the same defence he has made when accused of borrowing the fundamental situation of other of his chief plays. But, in anticipation of this, M. Uchard brings forward a new battery. M. Sardou, he says, is ever complaining of English "adapters"; now, what is he but an adapter himself? And this, in fact, is just what Sardou is—an adapter, a contriver, an arranger, a maker-over of old coats; but so skilful is he and so brilliant is his new gilt embroidery that it takes a keen eye to detect the trick.

Although he was one of the most artistic and consummate comedians of the French stage, Samson is perhaps best remembered now as the trainer of Rachel. It was he who planned Rachel's best work; hers was but the unequalled execution. It is therefore with not a little disappointment that we find that Samson's memoirs break off abruptly just after Rachel came within his circle, and just as he was about to set forth in detail his relations with her and his opinion of her character and genius. We learn more of the way in which they toiled together over a part from M. Legouvé's lecture on "Samson et ses Élèves" than from these pages. But if we get little new light on the workings of one of the greatest histrionic geniuses of this century, we have none the less an interesting picture of the early struggles of Samson himself, both pecuniary and artistic. He was very slow in making his way, but he was sure. Not only had he no great natural advantages, but he had positive defects to overcome by force of will and by dint of hard work. Worse than all, he was timid—distrustful of his own powers and terribly afflicted with stage-fright. Yet he began in a small provincial theatre, and he ended the first comedian of the Théâtre-Français, a teacher at the Conservatory, and the instructor of Rachel, Mme. Allan, Mme. Plessy, the Brohans, and of many others who now hold a foremost rank on the French stage. Such a life was worth living, and the story of such a life is well worth reading.

The Odéon, one of the most important and one of the honorable theatres in Paris, is fortunate in its historians. M. Porel is an actor of marked ability, and he has for many years been attached to the theatre whose annals he now publishes; while M. Monval, who was also an actor at the Odéon when this book was planned and when the first volume was published in 1876, is now the archivist of the Comédie-Française and the founder and editor of *Le Moliériste*. When the third and final volume appears, the Odéon will have a history worthy of its reputation, for the work before us is exactly what a book of this sort should be. It does for one theatre of Paris what Mr. Ireland in his 'Records' did for all the theatres of New York; and the French book is very like the American in its method and in its merits. For some years after the erection of the building, the Odéon was occupied by the Comédie-Française, which there gave the famous and long-deferred first performance of the "Mariage de Figaro" of Beaumarchais, on Tuesday, April 27, 1784. At the Odéon, again, in 1824 and 1825, Weber's "Freischütz" and "Preciosa," fearfully mangled, were first presented to the Parisian public; and in 1827, the English actors, headed by Charles Kemble and Miss Smithson, began to introduce English tragedy to the French and to lend the mighty aid of Shakspere to the then slowly-gathering Romantic movement. The next year, Victor Hugo's first acted play was performed there and damned out of hand. It was an "Amy Robsart" imitated from Scott, and produced as though it were the work of M. Paul Foucher, the poet's brother-in-law. In 1843 and 1844 began, still at the Odéon, the reaction against the Romanticists by the so-called School of Common Sense, with the "Lucrèce" of Ponsard and the "Ciguë" of M. Augier; and here, finally, the first play of Alfred de Musset met with a noisy reception, and the first play of M. Octave Feuillet met with one scarcely less boisterous.

There are many humorous incidents narrated with due effect in the course of the history, but none is so comic, perhaps, as a little slip of the author's in printing the name of Mrs. Cowley's comedy as the "Bell's Stratagem," and in translating it accordingly—"Le Stratagème de la Cloche"! This is almost equal to the famous rendering of Cibber's "Love's Last Shift" as the "Dernière Chemise de l'Amour"! It remains to be added that this mistake is almost the only one we have noticed in the two volumes, and we can also report that each volume has an excellent index.

'Vor den Coulissen' is a collection of some forty articles, written by as many theatrical and musical celebrities. It is a second venture, the first volume consisting chiefly of sketches and essays by actors, while in the present issue musical artists and composers predominate. While it is creditable to the theatrical profession that so many of its members should give evidence of a considerable degree of literary culture, it must be confessed that, on the whole, the book is a disappointment, and does not keep the brilliant promise of its table of contents. One naturally expects much enjoyment from "Recollections of Schubert and Beethoven," by Franz Lachner; from "Reminiscences of My Life," by Flotow; from "A Meeting with Heine," by Friedrich Kücken; from "Jenny Lind," by Sir Julius Benedict; but the principal benefit to be derived from reading these tempting productions is an abiding conviction of the truthfulness of Sydney Smith's new beatitude. They all give evidence of having been made to order, and are correspondingly flat and bald. In the four articles just mentioned there is but a single passage worth quoting—a letter of Heine to Kücken, enclosing some new poems which the composer was to set to music. It may be necessary to mention that Kücken is a playful North German expression for chicken. The letter is as follows:

"My Dear Kücken:

"Here are some eggs for you to hatch; don't cackle over them too long, and let me hear from you soon. Yours, H. HEINE."

Kücken asked Heine why he did not write his articles in the French periodicals in French (of which he was a perfect master), instead of writing them in German and having them translated by Alexander Weil, the well-known author of Jewish village tales. Heine answered: "It is said that I write a good German style, and I should hate to spoil it. Weil does the business well, and I pay accordingly."

One of the most serious contributions is Rubinstein's proposal for the establishment of sacred opera, which may be defined to be a dramatic oratorio, or an operatic miracle-play. The distinguished pianist considers the entire species of the oratorio objectionable, and is greatly disturbed to see the grand personages of the Bible represented by gentlemen in dress-coats and white cravats, and ladies in extravagant evening dress. He would have such themes represented dramatically, with all the accessories of costume and scenery. While he rejects the popular notion that there is any sacrilege in producing sacred subjects on the stage, he would make such a concession to a widespread prejudice as to have a theatre specially devoted to this new kind of entertainment. This project has been his hobby for a quarter of a century, and he has made numerous efforts to carry it into execution, applying for aid in divers quarters, but always in vain. The Grand Duke of Weimar, to whom he suggested the idea, was of opinion that it could only be carried out in a large city; Mühler, the Prussian Minister of Public Worship, thought it might be applicable to subjects taken from the Old Testament, but not the New, and did not consider that the state should concern itself with such an undertaking; Dean Stanley advised that it be tried as a popular entertainment in a booth at a fair. The nearest approach to success was in this country, the chief obstacle being the lack of the musical talent to produce the entertainment. Undaunted by all his failures, Rubinstein has composed two sacred operas—"Paradise Lost" and "The Tower of Babel"; and is writing four more—"Cain and Abel," "Moses," "The Song of Songs," and "Christ."

There are some amusing passages in a description of a concert tour in the Caucasus in the winter of 1879–80, undertaken by Désirée Artôt, her husband, Mariano de Padilla, and the pianist Sternberg. In Kizliar, Mme. Artôt, who relates the story, was terrified when she stepped upon the stage and beheld the audience, clad, some in furs and some in immense shawls, wearing high bearskin caps on their heads, girt about with broad belts which had a big knife and a brace of pistols stuck in them, and holding lances in their hands. This audience manifested its applause by bellowing like wild beasts. Although programmes had been distributed, not a soul stirred when the concert was over. The artists were frightened. Mme. Artôl sang a few more airs. Still the audience remained seated. Her husband sang a few more airs. The audience howled with delight, but made no motion to go home. Then M. Sternberg sat down at the piano, and played without interruption till three in the morning. In another place, a half-savage fellow bought a ticket for five rubles. After the second number of the programme he walked out with tears in his eyes, went to the ticket-office and laid down a fifty-ruble note. "What is that for?" asked the manager. "For my ticket." "But you paid for your ticket." "Oh, no, sir," shaking his head; "I should be ashamed of myself to hear such great people for only five rubles."

An Amsterdam manager, A. van Lier, tells a good story of Marie Seebach, who played a star engagement at his theatre in 1855. On the way from Amsterdam to Leyden the actress lost her jewel case, containing valuables to the amount of 20,000 thalers. Her despair may be imagined, and it was with the greatest difficulty that she could be prevailed upon to go upon the stage that evening. The manager succeeded in recovering the lost treasure, and in doing so incurred an expense of thirty-eight guilders. When pay-day came he desired to deduct this amount from what was coming to Seebach. "See here, my friend," she said, "our agreement was to go

halves on this trip; I'll pay nineteen guilders, and you can pay the other half."

The longest article is a lecture delivered in Florence by Salvini, and treats of Hamlet, Macbeth, and Othello. Salvini's views of Shakspere are not unknown to American readers, and it is not necessary to examine them here; but it is curious to note what a singular blunder so clever a man may commit. He gives several reasons, none adequate, for the innovation he introduces, in the final scene of "Othello," of cutting his throat, instead of stabbing himself, as other actors do. One of the reasons is this speech of Othello:

> "I took by the throat the circumcisèd dog,
> And smote him—thus."

He argues from this that Shakspere intended that Othello should cut his throat. Now, leaving out of view the stage direction, "Stabs himself," which may be an unauthorized interpolation, and admitting that the word "smote" may be ambiguously translated in the Italian version, it would be interesting to have it explained how it is possible to cut the throat of a man whom one is holding by the throat. It would be, to say the least of it, an awkward and complicated operation, while to plunge a dagger into the breast of a man so held would be a natural and impulsive action.

It will indicate the cosmopolitan character of the book to mention that besides Salvini's contribution, it contains a lecture delivered at Edinburgh in November last by Henry Irving, on "The Stage as It Is," and a sketch of the German stage in New York, by Adolf Neuendorff, the manager of the Germania Theatre, who does not even mention the rival establishment, the Thalia Theatre—more successful, if not more important, than his own. The sad fortunes of the German opera in New York are briefly narrated by Mr. Max Goldstein, formerly the editor of a musical journal in this city, but now living in Berlin.

Guide to Moosehead Lake and Northern Maine. By Lucius L. Hubbard. 3d ed. Boston: A. Williams & Co. 1882.

Paddle and Portage. By G. W. Steele. Boston: Estes & Lauriat. 1882.

It is an odd fact that the art of getting away for a little from the complexities of modern life has more than kept pace with the development of those complexities. We have Horace's word for it that in his day Care scaled the brazen-prowed trireme; while every sportsman nowadays knows that Care never yet ventured to put foot in a birch canoe. It is much to be feared, however, that she will go with the crowd the moment the birch canoe becomes fashionable, and for that reason there are many people who are sorry that it ever occurred to Mr. Hubbard to write the guide-book whose title we give above. The thing being done, however, the jealous lovers of the Maine woods must reconcile themselves to the fact, and are at least bound in honor to admit that if their secrets must be revealed, it could not be by a more faithful hand. Mr. Hubbard's third edition shows unwearying work. A considerable amount of new matter has been added, dealing in particular with the extreme northern and northeastern parts of the State, and an additional map has been made which covers the headwaters of the St. John and Aroostook Rivers. The two beautifully printed maps now included in the Guide represent a prodigious amount of the most careful labor. A slighter addition, but one which will be welcome to amateurs, is to be found in the two pages of illustrations of the foliage and bark of the six most familiar evergreen trees. A feature which we shall hope to see further developed in later editions is the explanation of the meaning of Indian proper names, in which northern Maine is very rich.

Of quite a different character is Mr. Steele's 'Paddle and Portage,' the alliterative successor of his 'Canoe and Camera.' The new book purports to be a narrative of adventures on the trip from Moosehead Lake, Me., to the Aroostook River. These adventures are made to do service to their utmost capacity, the most effective of all being a moose-hunt in which no moose was seen, and the inflation by the guides of the rubber beds of the luxurious tourists. The narrative serves, however, as a thread upon which to string unnumbered stories and jests, of which material the writer appears to have so large a supply that one cannot help regretting that he should have found it necessary to repeat upon page 50 and illustrate over again by the engraver's art his jest upon the "wet and dry process of photography," from page 77 of 'Canoe and Camera.' Mr. Steele's nimble fancy should have been kept under some control for the sake of people who know the things he is writing about. He himself is, of course, perfectly well aware that his Indian guide, Thomas Nicholas, does not talk Indian English in real life as he does in Mr. Steele's book. He probably knows that no guide would draw up a canoe into such a place as one is seen to occupy in the illustrations upon pages 52 and 101, unless it were for the especial purpose of making a falsely effective foreground for a picture. He cannot believe in his own heart that even a party of novices without a guide would arrange for a carry as is shown in the monstrous illustration on page 43, where one may see a canoe placed upon a sled, another laid directly above that, with no other support, and two men seated, in absolute indifference to consequences, upon the upper canoe. And at any rate, whatever may be the impression which Mr. Steele is willing to convey in regard to his own knowledge of wood-lore, he ought not to represent his "comrade adventurer," Colonel G., who has a sportsman's reputation, as jerking a trout "which weighed above two pounds" high into air with a rod that bent "like a whip-lash."

A map prepared to accompany this book would naturally be a careful presentation of the country through which the trip was made. Instead of this, we find a map of all northern Maine from Moosehead Lake up. The region of the author's trip is given with much less detail than in Mr. Hubbard's new map, while the rest of the map abounds with errors. Towns and houses are placed on the wrong bank of rivers, or are removed miles from their true situation (see on the St. John River Savage's, Baker's Mills, Fort Kent, Edmundston, and the Edmundston block-house). Even for Moosehead Lake, the map is grossly wrong. Deer Island is placed far from its real position, and two islands are put down to the southwest of it which have no existence. Mount Kineo itself is twisted out of shape, and even the Kineo House is placed where it is not. The simple secret of all these errors is the fact that Mr. Steele copied his map, with scarcely a change, from the very inaccurate and now antiquated State map.

The style of the book is in admirable keeping with the illustrations and the map. The author finds it well to use italics thrice in a single page of preface; to use the word stimulate in place of the word produce; to speak of horses' snouts, etc., etc. A single sentence will illustrate the peculiar glow of his manner. Its meaning, as appears later, is that the Colonel and Mr. Steele took their guns and went off to shoot a partridge or two for their first supper. But Mr. Steele uses no such commonplace language. Under his pen this simple occurrence becomes: "And the Colonel and I, seizing our rifles, sauntered forth with sanguinary strides to decrease the population of the forest game in the interest of our first meal."

Notes Preparatory to a Biography of Richard Hayes McDonald, of San Francisco, Cal. Compiled and edited by his Eldest Child, Frank V. McDonald. Vol. I. Honour thy Father and thy Mother.—Ex. xx. 12. Cambridge: University Press. 4to, pp. xvii.–119.

The enormous size of the vegetable products of the Pacific Coast would appear, from this sumptuous volume, to have an analogy in the cultivation of the domestic virtues in that favored section. Mr. F. V. McDonald has already published three genealogical works on his father's family, and one on his mother's, and will have another quarto volume of 'Notes Preparatory' before arriving at his ultimate task of a Biography of his father, all the main incidents of whose life and a large number of the petty are related in the work before us. But why do we say ultimate? Dr. R. H. McDonald is still living, and it is not intimated that the Biography will be postponed till his death. When that event occurs, filial piety will certainly prompt another tome or tomes in memoriam. A small library will thus take the place of the modest memoir which, east of the Rocky Mountains, usually discharges a man's obligation to honor his father and his mother, even when they have been persons of eminence. Dr. McDonald's distinction consists in his having been the pioneer druggist in California, and in his being now the President of the Pacific Bank. From his predecessor in that office, ex-Governor Burnett, we have lately had some very interesting autobiographical 'Recollections'; and if his example has become a tradition and regulation of the bank, it is clear that that institution must be reckoned among the more important literary agencies of the land of gold.

Governor Burnett, however, was content with 448 pages duodecimo, and candor compels us to say that had Dr. McDonald written about himself in the first person, not only would the story have been much more valuable, but it would have occupied, it is safe to infer, scarcely one-quarter of the space allotted to it by his son. This defect of second hand is perhaps nowhere felt more than in the chapter relating to Dr. McDonald's practice among the Mormons at Nauvoo at the time of their expulsion. The editor, on his part, has taken considerable pains with this episode, whose relative importance in any rational biography of his father he has tacitly signified by giving in an appendix forty pages of extracts from various works on the Mormons. But still he has not succeeded in making a real contribution to the subject as his father might have made, and as Governor Burnett did make in recording his experience with the sect during its earlier lodgment in Missouri. The hardships of the overland journey in 1849, Dr. McDonald's first partnership in the business of dealing in emigrants' outfits, and squatter and gambling lawlessness, furnish occasion for graphic descriptions, and this has been well improved. We can also praise the interesting foot-note on page 84, which explains why Sacramento fell behind in the race with San Francisco. The editor is old enough to speak from personal recollection of the time when the American River had not begun to be filled up with silt from the mining sluices; and this incident in the development of California is worthy of a place in the late Mr. Marsh's 'Man and Nature.'

To a foreign reader Dr. McDonald's career will probably appear more eventful than to an American. He was a native of Kentucky, and his early years were passed in that State and in two adjoining, until the gold fever caused him

to embark, with a thousand other dissatisfied, invalid, or ambitious spirits, in the quest for laborious ease. He did not perish by the way, nor in the struggle for existence at the end, and his face shows him to be a typical American of the Western variety. We should hardly have supposed another volume necessary for the "preparatory notes" on his "family relations," his "life as husband and father" and as a "man among men" in the State of his adoption. But there can be no limit to filial reverence, and the means to gratify it in print seem in this case to be also illimitable. The numerous family portraits, on wood and steel, and the singularly chosen illustrations, of which "Indian Summer" may be taken as a specimen, leave no doubt as to the pecuniary backing of this unusual enterprise. As to the genealogical part, this line is doubtless traced from Brian McDonald who settled in New Castle County, Del., and died in 1707. It is here stated that he was from Wicklow, Ireland, had been one of the supporters of James II., and, above all, that he was descended from the Mac Donnells of Leinster, a branch of the Lords of the Isles. Pedigrees are proverbially problematical, but we never feel sure that the Irishmen believe in their own pretended records. Lists of names without evidences of any description, without a single point on which to fix a distinguishing mark, are as worthless as the columns of a herd-book. But as we have not yet read the fuller genealogy also issued by Mr. MacDonald, perhaps we do him less than justice.

We cheerfully comply with the editor's request to mention that the work has been placed in the leading libraries of the country and in the British Museum.

BOOKS OF THE WEEK.

A Tight Squeeze; or, The Adventures of a Gentleman as a Professional Tramp. Boston: Lee & Shepard. $1.
Cook, B. F. History of the Twelfth Massachusetts Volunteers (Webster Regiment). Boston: Twelfth Regiment Association.
Craik, Georgiana M. Fortune's Marriage. Harper's Franklin Square Library. 20 cents.

Look Before You Leap.

By Mrs. Alexander, author of 'The Wooing O't,' etc. 16mo (Leisure-Hour Series), $1.

Kinley Hollow.

By G. H. Hollister. 16mo (Leisure-Hour Series), $1.

"It is quite above the line of the ordinary novel. To the merits upon which we have specially remarked, the skilful and effective delineation of a past and gone society, the realization of old fashions of thought, and the faithful representation of types of character which had much to do with making New England what it is—it adds the further excellences of vivacious dialogue, which serves really to illustrate the speakers, and a strong feeling for the beauties of nature."—NEW YORK TRIBUNE.

HENRY HOLT & CO., New York.

Important New Text-Books.

FRENCH SYNTAX. On the Basis of Edouard Mätzner. By James A. Harrison, Professor of Modern Languages in Washington and Lee University, Author of a 'History of Spain,' and Editor of Beowulf, Selections from Heine, etc., etc., etc. 12mo, cloth extra, $2 50.

THE SCIENCE and ART of ELOcution; or, How to Read and Speak. A Series of Exercises for Gesture, Calisthenics, and the Cultivation of the Voice; and a Collection of nearly One Hundred and Fifty Literary Gems for Reading and Speaking. *New and enlarged edition.* By Frank H. Fenno, of the National School of Oratory. 12mo, cloth extra, $1 25.

THE ARTIST and his MISSION. A Study in Æsthetics. Designed for the use of Schools and Colleges. By Rev. William M. Reily, Ph.D., Professor of Ancient Languages, Palatinate College. 12mo, cloth extra, $1 50.

A MANUAL of the GERMAN Language. By Augustin Knoflach, Teacher of Languages. 12mo, cloth extra, $1.

AN INTRODUCTION TO THE Study of English Literature and Literary Criticism. Designed for the use of Schools, Seminaries, Colleges, and Universities. Vol. I. POETRY. By Prof. James Baldwin. 8vo, cloth extra, $2 50.

The Nation.

NEW YORK, THURSDAY, AUGUST 31, 1882.

The Week.

COLLECTOR DANIELLS, of the Oswegatchie District, has just been removed, in the middle of his term, without cause, which is not what the civil-service doctrines of the President's Message led us to expect, but is quite consistent with the general contempt displayed by the Stalwart faction for their own professions on all matters connected with the civil service. Moreover, it will continue, like all political abuses, until it meets with punishment at the polls. Collector Daniells was, we believe, an officer without reproach, and his removal is, according to the local papers, meant as "punishment" for Congressman Parker for going to Albany to lobby against the reëlection of Conkling and Platt, and for the State Senator and County Assemblymen for "carrying out the wishes of their constituents in the matter," and for divers other persons supposed to be Mr. Russell's patrons or backers. But then as long as such occurrences are resented on these grounds solely or mainly, we shall have no improvement. If we object to the arbitrary removal of an officer because it "punishes" some politician, we acquiesce in the whole spoils system. The real objection, and the only one that will hold water, to turning officers out of their places without cause is, that it is an offence against the people of the United States, and injurious to their business. As long as Senators and Assemblymen can be "punished" by removals, it will be done, when their enemies get into power, as part of the little game which political factions play with each other.

The humor of Hubbell's performances as an assessor of officeholders is heightened by the fact that the practice seems to be spreading among all who in any way "influence" appointments. Mahone, of Virginia, for instance, having had the Federal patronage in Virginia placed at his disposal, seems to think that this gives *him* the right of assessment. Accordingly he has issued a circular assessing the Virginia officeholders five per cent., in addition to Hubbell's two per cent., making a "voluntary contribution" of $84 on a clerk's salary of $1,200—an enormous sum to take from a poor man for any purpose, without authority of law. There is no good reason now, under the spoils theory, why individual members of Congress should not assess officeholders for whom they have procured places, or indeed sell their "influence" openly for a fixed sum to be used in procuring their reëlection. It is, however, pleasant to witness the rapidity with which the system is running into wild and ridiculous excess. Congress must interfere to stop it, as it is assuming the character of simple plunder, against which officers will have to recoup themselves, as in Turkey, by fraud and embezzlement. The demand of the Michigan Democrats, in their platform, that the practice be made felony, is really neither untimely nor extravagant, whether it be sincere or not.

Like Mahone, Cameron's State Committee ferrets out all those who owe their appointment to Pennsylvania "influence," warns them of "what must prove a great battle with the Democratic party," hands them the hat, and assures them of its belief that they will esteem it "both a privilege and a pleasure" to drop in not less than the two per cent. aforesaid. "Such voluntary contribution," the Committee facetiously remark, in the now stereotyped phrase, "will not be objected to in any official quarter." But it is high time the public were told, from the only official quarter worth taking into account, at what percentage his objection will begin; for though there is a considerable margin between seven or even four per cent. and one hundred, President Arthur must be aware that the principle of these exactions would justify an indefinite encroachment on the salary of the political appointee. If fifty per cent. would not trouble his conscience from a moral and legal point of view, four per cent. should be quite enough to shock his feelings as a kind-hearted and sympathetic man.

Although the Bank of England's posted discount rate remains 4 per cent., the actual discount rate in London advanced during the week to near the posted rate. The Bank of Belgium put its discount rate up to 4½ per cent. Exchange at New York on London advanced during the week to near the gold-exporting point, and $300,000 gold was actually shipped. The exports of domestic merchandise from this country were very large during the week, but this had little influence on the market for foreign bills, for the reason that in the drawing of bills these exports had been anticipated. The foreign-exchange market may, however, on any day decline sharply, and there is no fear of any significant gold exports. The Treasury continues to take in more money than it pays out, and some currency has been sent during the week from New York to interior cities. Altogether, however, the statement of the New York banks for the week was less unfavorable than was expected; they still hold a surplus reserve of $1,131,025, where a year ago they lacked $2,568,025 of the 25 per cent. reserve required by law, and the rate for demand loans did not rise above 5 per cent., except momentarily. The United States Treasury officials were busy during the week in exchanging 3½ per cent. bonds for the new 3 per cents, and it is expected that the Treasury will shortly issue a call for the redemption of $15,000,000 more 3½ per cents. The news respecting the harvests continues encouraging, and everything promises a sound and profitable autumn trade. The passenger agents of the trunk-lines early in the week agreed upon a schedule of differential rates between Chicago, St. Louis, and Cincinnati, and New York and Boston, to take effect September 1. On the same day, also, the advanced rates of the Southern Railway pool go into effect. The new trunk-line from Buffalo to Chicago, which parallels the Lake Shore, and which is entitled the New York, Chicago and St. Louis Railway was opened for business during the week. At the Stock Exchange it was a week of declining prices, until near the close, when a part of the decline was recovered.

It seems that the prohibition agitation in the West is alarming both the Republican and Democratic managers at Washington. In some of the Congressional districts the temperance organizations are working against both parties, and upsetting all calculations. They have no doubt been greatly encouraged by their recent success in Iowa, where a constitutional amendment forbidding the sale of liquor has been passed; and there are plenty of indications, of which the most recent is that furnished by the Convention which adjourned last week at Chicago, that they will soon make their demands heard very plainly at Washington. The Chicago Convention adopted a good many resolutions which have nothing to do with temperance or prohibition; but its real object was to organize a national party, for the purpose of securing the absolute prohibition of the manufacture and traffic in liquor. The two resolutions which relate to this subject are as follows:

> We declare in favor of the following national principles and measures, to be incorporated in the national Constitution and enforced by Congress and the Government:
>
> I. The prohibition, as public crimes, of the importation, exportation, manufacture, sale, and supply and taxation of all alcoholic beverages.
>
> II. The prohibition of tax, license, regulation, or legal sanction in any form of them, or any other public crimes.

It will be seen that the legislation which this plan calls for is very comprehensive. It is not merely that the Prohibitionists demand that the Constitution should be amended so as to make the manufacture and sale of liquor a crime, but they would prevent also the raising of any revenue from it, and propose to strike at the roots of all state license laws, which would, of course, be simply void, after the adoption of the amendments, as being in conflict with the Constitution.

We have looked in vain, however, through the proceedings of the Convention for any indication that the Prohibitionists perceive that the great difficulty with which they have to contend is not legislative. What they undertake to do is not merely to pass laws to prohibit, but actually to break up, the business. Yet the means required to do this are seldom or never discussed by them. It is assumed at all the conventions that making it criminal and subjecting those who engage in it to statutory penalties, is all that is asked. Fifty years ago it may have been fair enough to assume this; but after all the experiments that have been made, and all the failures that have resulted, it can hardly be considered so any longer. Liquor is sold as openly in Maine to-day as it was before the Maine Law was heard of, and in Massachusetts, where a special constabulary was orga-

nized for the purpose of keeping the bars closed, the work was only accomplished for a time. The public would not endure the stringency of the law, and repealed it. In the Western States which have adopted constitutional amendments on the subject, the traffic goes on, according to the latest accounts, much the same as before. It can hardly be that the Prohibitionists are really satisfied with this state of things, and their determination to make the matter a national issue shows that they are not. But as they are going into national politics, it is highly important that they should consider and let the public know what precise means they intend to take to carry out their scheme. When they have got their constitutional amendments adopted, they have still to meet the old difficulty of enforcement. The question is something like that of "abolishing polygamy." Would they employ troops? Would they break up all liquor-shops by means of a national police, and throw the "rum" into the streets? What would they do?

At a Boston session of the Tariff Commission Mr. H. O. Houghton, of the publishing firm of Houghton, Mifflin & Co., gave some novel reasons for objecting to any reduction of the twenty-five per cent. duty on books. Authors, he said, "are likely to reside at the centres of the manufacture of books," and, "if the duty were removed, the manufacture of books for this market would largely be in Germany and England. This would compel the residence of even American authors to a very large extent abroad. We all know how much any person is influenced by the locality in which he resides, and this fact cannot fail to show itself in the character of the books written by such authors. The readers of books in this country are very largely young persons, and our institutions, both political and religious, and our modes of thought, are radically different from those abroad. The effect, therefore, of removing this duty would be, primarily, the manufacture of American books abroad; secondarily, their teaching principles of politics and religion and modes of thought alien to the theory of our institutions." It is easy to see that the effects of the removal of the duty would not stop here. As soon as a new generation of Americans became thoroughly steeped in "modes of thought alien to the theory of our institutions" the next step would be to attempt to undermine these. European modes of thought would be fatal to their permanence, and Europeanization of America is inevitable if the duty on books is not maintained. Thus not only the future of letters in the United States, but that of freedom and progress throughout the world, hinges upon the retention of the duty on books. Now that the danger is pointed out, it will, we suppose, be avoided; but some means ought to be taken to insure its being kept permanently in view. Mr. Houghton's argument ought to be preserved, and the young should be made familiar with it as early as possible. All children are taught that vigilance is the price of liberty, but the maxim is open to the charge of vagueness, which could never be brought against Mr. Houghton's substitute that the price is simply a twenty-five per cent. duty on books. Nothing short of twenty-five will do, it should be remembered. Ten, or fifteen, or even twenty would be equally fatal, and we cannot afford to run any risk about freedom.

The renewed discussion as to the character of Mr. Conkling's legal practice can hardly be altogether satisfactory to his clients. It seems as if no certain conclusion could be arrived at about it. When he abandoned politics and returned to the bar, some lawyers maintained that he had as lucrative a business as any man in New York, and it was stated that a leading firm had offered him a guaranteed income of $50,000, his refusal of which was a pretty sure indication that he counted on making more. Other lawyers maintained that he had not a client in the world, and, moreover, was no lawyer, and that when he appeared in court and attempted to argue a point of law he cut such a ridiculous figure that the whole court had great trouble not to roar with laughter. A dispute as to whether a man is a leader of the bar or is unfit to argue a case, is a very singular one, and we do not remember one like it in the history of his profession. The dispute now as to the character of his practice is not less singular. There is no doubt that he was retained by the Elevated Railroad to make an argument before Governor Cornell on the Tax Bill, but the reason why he was retained is involved in mystery. According to Jay Gould, the Governor asked that he be retained because otherwise his (the Governor's) mind could not be satisfied on certain constitutional points. On the other hand, the Governor's organ declares that Mr. Conkling was retained by Jay Gould to bribe him. Mr. Conkling's friends say, of course, that this, with a man of his lofty integrity, is impossible. But for all that the effect on his practice cannot be good. When there is some doubt as to the nature and extent of a man's practice, to have the judge before whom he argues suddenly denounce him for attempting bribery, must be disheartening to clients. If they like bribery, they must wish it to succeed; if they dislike it, they cannot be pleased at having their lawyer accused by the judge of trying to corrupt him. No firm would like to guarantee $50,000 a year to a lawyer whose practice produced such queer results.

The Free-thinkers have been holding a national convention at Watkins Glen, in this State, and a very considerable body of delegates was assembled, representing most of the Northern and some of the Southern States and Canada. The subject of establishing a Free-thought university was brought up for discussion, and a committee, with "Bob" Ingersoll at its head, appointed to see what can be done toward establishing such an institution. That the Free-thinkers should imagine it to be an easy thing to establish a university of this sort would not be unnatural, because in this country, as a general thing, there is nothing, except starting a newspaper, which is so simple. The United States fairly swarms with institutions of learning of this kind, the very names of which are unknown to almost everybody but those who have graduated at them. We have ten or a dozen universities to every one in England, France, or Germany. These institutions, however, have generally been connected with religion in some way. Some of them were originally, like Harvard and Yale, denominational in character, and gave the Church a share in their government; all of them have recognized religion in some way. The attempt, therefore, to set up an agnostic or infidel university is different from those which have been made heretofore. It must be, of course, an institution designed for the education of youth as well as for the propagation of atheistic opinions. If we understand their platform, it is that the great hindrance to the moral elevation of the race at present is the Bible and a belief in God, and consequently one great object of the university must be the establishment and preservation and inculcation of a true atheistic morality. The idea is a novel one, and, however true and sound it may be, the experiment will be watched with jealousy and suspicion by the religious world, and even by a large part of the free-thinking world. The free-thinking parent's view of religion generally is that, however little foundation there may be for it, it has the great advantage in education of supplying a simple and intelligible foundation for morality, and this he likes to make sure of for his children. Now the Free thinkers propose to supply morality by destroying religion; in fact, they insist that this is the only way to make sure of morality. It will be curious to see what new means they will take to secure their end.

The judicial investigation of the Keely-motor secret has come to a very extraordinary end. The company, which has spent some $150,000 to enable the inventor to carry on his experiments, applied to the courts to make him disclose the nature of his invention, and patent it. William Boekel was agreed upon by all concerned as the man to receive the secret, and he has now filed his report. He declares "unhesitatingly" that Mr. Keely has discovered a "new force or motive power," which he also describes as "a substance evolved by him through the instrumentality of his structure." This substance, he says, is a "vaporic" or "theric" force, and "possesses properties peculiar to itself," and "wholly phenomenal in character"; in which respect it seems to resemble the language used to describe it. He adds that Mr. Keely has so far perfected his invention as to entitle him to take out a patent. Still, the subject involves "the study and application of vibratory forces," and is one requiring "time, patience, and closest attention, both on the part of the inventor and investigator, to enable the one to perfect its utilization, or either to give such technical description thereof as to meet the requirements of the law, as the condition of obtaining valid letters patent," and he does not yet feel that the time has come to make the application. The stockholders, therefore, seem to be in much the same position as they were before they filed their bill. They might, of course, insist that some time should be fixed within which a patent should be applied for; but no estimate of this can be made without some knowledge of what the "force" is, and the resources of language do not seem to be adequate to convey this from one mind

to another. Mr. Boekel has as rich a vocabulary as any scientist in the world, and yet what he says is unintelligible. This is a difficulty which the framers of our patent laws never anticipated.

We trust that the report of the meeting of the trustees and subscribers of the Irish "Skirmishing Fund," which appeared in the papers on Monday, will fall under the eyes of Sir William Harcourt, the British Home Secretary. If it does, it cannot but bring him a peace which he has not known for a year or two. It might also bring relief to the numerous English writers who have been demanding the interference of the United States Government with the Irish advocates of dynamite in this country. O'Donovan Rossa has now long been a shape of dread to the British Home Office. He has been often referred to in Parliament as an excuse for all sorts of interferences with the liberty of the subject in Ireland. When the Parnellites or the Radicals objected to any proposed curb on the Irish press or the Home Rule orators, Mr. Forster or Sir William Harcourt used to put them down by reading a passage from the works of Rossa, or from the columns of the *Irish World*, which sent a tremor through the English benches, and made all further debate seem idle. It is true that Rossa's threats have been very dreadful, and we have no doubt he would have liked to execute them; but it now appears that he never was willing to spend any money on them. The "Skirmishing Fund" was for some time in his hands, and much of it disappeared in that interval, and none of it, it would seem, was put into warlike preparations of any kind. Two thousand dollars went, he says, toward the construction of a "ram" for the destruction of the British Navy, but he declines to state how far the work was carried forward for this amount, and there is much reason to believe that it was spent on "stores," and particularly on rum, for her prospective crew. He acknowledges, however, that he spent $2,000 more on "the funeral of O'Mahony," which we think a moderate amount, considering how attractive funerals must be to a man of Rossa's festive nature. He managed to turn over about $90,000 to new trustees who were appointed to take charge of the fund, under the pressure of indignation excited among the subscribers by the continuance of British commercial prosperity, so to speak, under their very noses.

These trustees, in their turn, have now been called on for an account, and have none to render. It is impossible to say whether there is any money left, or, if spent, what it has been spent on. The subscribers are accordingly very angry, and there was some talk at the meeting of inflicting "capital punishment" on the trustees; but pending this, a committee was appointed to get an explanation from them. It is but reasonable to suppose that the money which these amusing charlatans raise and squander is collected from the later emigrants. It is hardly possible that any of the Irish who have sense enough to earn and save money, give twice to any of these funds. The Fenian funds were all grossly misappropriated, and the lesson must have been sufficient for one generation. The "Skirmishing Fund" must have come from a new batch of simpletons. It is on their behalf, rather than on that of Great Britain, that our Government should interfere, if at all, with the performances of Rossa and the *Irish World*. It is quite certain that neither is disposed to waste good money on rams or dynamite in a city which contains so much good whiskey and such fine provision markets as New York.

The insubordination and threatened strike of the Irish constabulary is a new and serious phase of the Irish trouble, and is likely to rob the Ministry of a good deal of their well-earned holiday. The force numbers nearly 12,000 men, and has really constituted the garrison as well as the police of Ireland for fifty years, and does work which it would take three times the number of regular troops to do. Moreover, although the men are all Irish, and almost all Catholic, their fidelity to the Government has never until now been shaken; and, strange to say, they have until now managed to keep on good terms with the people, although constantly aiding the sheriff in carrying out evictions. Their duties during the past two years have been exceedingly trying, involving in some districts all the hardships of active service in the field; and yet they have not flinched or murmured. These services have been recognized, first, in the peculiarly English way, by having the word "Royal" stuck on to the name of the force, and then by a vote of extra compensation. The pay has also been increased, but this was due to the increased difficulty of keeping the ranks full. What is the cause of the trouble now pending is not very clear. As the men were apparently satisfied with the money bonus, it seems as if there had been some bad management in the way of arbitrary acts or overbearing language on the part of superior officers. After the first revolt had been quieted, an apparent attempt to single out six of the ringleaders for a mild sort of punishment again roused the ire of the men, and resignations on a large scale are going in; the police on duty in the city of Limerick have abandoned their posts, and a general strike is threatened.

The crisis thus created is, perhaps, as serious as anything the Government has had to face in Ireland within fifty years. It cannot now concede very much, because concessions to an armed force, extorted by a strike or mutiny, would, of course, be fatal to all discipline in the future. Moreover, it is exceedingly doubtful whether, if the present constables were dismissed, it would be possible to fill their places with Irishmen who would be worth much as police. Only inferior men would accept a kind of employment which had become surrounded with popular odium, and any men who took it would take it with the consciousness that they had their employers in their power. A police force animated by this feeling would, of course, be worthless and worse than worthless. In default of Irishmen, it might be composed of Englishmen; but their appearance would probably excite so much hostility that when scattered in small parties all over the country, their time would be taken up in the protection of their own lives. The trouble may be got over for the moment, in spite of the pains which the Home Rulers are doubtless taking to egg the men on into desertion, but it will only be got over, as we have said, with serious injury to the discipline of the force, which is the same thing as saying that it will only be postponed. It is trouble which, apparently by a wise dispensation of Providence, is always in store, and is sure to come, for any Government which prolongs greatly the experiment of meeting popular disaffection with armed force, whether the force be native or foreign.

Sir Garnet Wolseley, feeling his way along the railroad toward Tel-el-Kebir, on Thursday moved out with about 2,000 men a distance of seven miles, and, after some skirmishing, found himself in front, he says, of a force of about 10,000 men, largely brought up from Tel-el-Kebir by train. In spite of the disparity of numbers, however, he thought it best to stand his ground, and appears to have played at long bowls with the enemy all day, suffering only a few casualties. On the following day Wolseley attacked a camp of the enemy at the Mahsama Station, on the railroad, about half way to Tel-el-Kebir, and appears to have completely routed them, taking five guns and seventy-five railroad cars laden with provisions, and inflicting considerable loss in men. As this was done mainly with the cavalry, the horses of which are not yet in condition, it speaks ill for the assistance Arabi is getting from the Bedouins. If stories told about the way they have been flocking to his standard were one-quarter true, he ought to have now a swarm of admirable light cavalry, which would have rendered the operation at Mahsama impossible, and the march across the desert, which Wolseley says the infantry bore so very well, difficult, in the present condition of the English horses. Arabi's time to strike a blow was during the days of confusion following the British landing, and he has let it slip.

He has, however, in spite of the loss of Fehmy Pasha, his military adviser, who is a prisoner in the hands of the British, attempted to make up for his supineness during the last fortnight by striking a blow at Kasassin, about ten miles east of Tel-el-Kebir, but has been repulsed with the loss of eleven guns. That this has been his best effort is shown by the loss of the British, which, though only 120 men, killed and wounded we presume, is the largest the Egyptians have yet been able to inflict in one affair. Whether Arabi would have done any better if Wolseley's move to the Canal had not taken him by surprise, it is, of course, useless to speculate. He will probably now be driven into Cairo, if he does not escape into Tripoli from Alexandria. That the rising of the Nile will do him much good is an error, because he is no more aquatic than the British, and cannot keep an army together in an inundated country. The greatest danger now is that he may serve Cairo, which has some priceless treasures, both archæological and architectural, as he served Alexandria, by giving it up to his defeated army.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, August 22, to TUESDAY, August 29, 1882, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR has been spending the week in pleasure at Newport, R. I., where he has been the guest of ex-Governor E. D. Morgan. On Wednesday he attended a grand review at Fort Adams. In the afternoon there was a reception at Governor Morgan's residence. On Thursday the Presidential party visited the Torpedo Station at Newport, and was shown the appliances of modern warfare. There was a reception at Oaklawn in honor of the President on Friday, and a formal dinner at Governor Morgan's in the evening. He gave a one-hour reception at the Ocean House on Monday, and on Tuesday attended a private dinner.

Assessment agents of the Hubbell Congressional Committee visited the departments at Washington last week, and systematically "worked" them for election contributions. The chief clerks were visited, and permission was asked to call on the clerks. When this was granted, the agents, who have complete lists showing who have and who have not subscribed, called on the delinquent clerks and asked for two per cent. of their salaries. This demand was generally complied with in cash or a promise to pay on the next pay-day. A second circular letter has also been addressed to delinquent officeholders in other cities, asserting that the Congressional Committee "cannot hope to succeed in the pending struggle if those most directly benefited by success are unwilling or neglect to aid in a substantial manner." Federal officeholders from Virginia are also receiving a circular, calling on them for a contribution of five per cent., to support the Readjuster movement in that State. The regular Republican Committee of Pennsylvania has called upon those Government employees at Washington who secured their appointments from Pennsylvania for two per cent. of their salaries for the State campaign.

In the anti-Cornell struggle which is going on among the politicians of this State a great deal has been effected during the week. The sentiment against the Governor's renomination has increased with great rapidity. Still, the majority of the delegates elected by the district conventions to the State Convention seem, thus far, to favor him. The Governor has had a conversation with a representative of the New York *Times*, which was published on Saturday, and in it some of the charges against him are partly explained. He admits that the Albany *Journal's* article against Mr. Conkling grew out of a conversation of the editor with him, but he denies that he ever said that Mr. Conkling had attempted to bribe him. He adds: "I do say that I did believe, and had every assurance, and I believe still, had I been pliant to the wishes of Messrs. Gould and Conkling in the matter of the Elevated Tax Bill, I should have, if not their support, at least not their opposition." As to the charge that he borrowed money from the American District Telegraph Company, while one of its officers, he admits it, but asserts that it was secured by District Telegraph stock worth double the amount, and was soon repaid. He denies the charge that he managed the "blind pool" dishonorably, and declares that although made up on paper, it never went into effect. James W. Wadsworth, a Representative in Congress from western New York, is prominently mentioned as a suitable candidate for the Governorship.

Tammany Hall's attitude in the approaching campaign in this State is a question of considerable importance. Mr. John Kelly said, in an interview on Wednesday, that it was as yet undecided whether or not they would send delegates to the regular Democratic Convention at Syracuse. He continued: "What treatment such a delegation would receive at the hands of the Democratic Convention no one can tell; but this much is certain, that Tammany Hall is stronger now than it was a year ago, and unless these selfish rulers who now control the machinery of the Democratic party wilfully abandon all hope of victory, they will admit the Tammany delegation, or at least afford them some recognition. . . . If we do not decide to send a delegation to Syracuse, or if we send such a delegation and they are not received, then we shall hold a city convention, and probably endorse the ticket nominated by the Anti-Monopolists."

The National Prohibition Convention met in Chicago on Wednesday. About 300 delegates were present. An animated debate occurred over a set of motions to add the names of certain women to the committees. All were laid upon the table, except the motion to add Miss Frances Willard to the Committee on Resolutions. The session was concluded on Thursday, after the adoption of a platform declaring in favor of the following principles and measures to be incorporated in the national Constitution: Absolute prohibition of the manufacture or sale of all alcoholic beverages; the abolition of polygamy; the abolition of all forms of official patronage; compulsory education; preservation of public lands; abolition of monopolies; and regulation of railroads. The woman-suffrage question was remitted to the party in the several States.

At the Democratic State Convention in Michigan, on Wednesday, a proposition for fusion with the Greenbackers was carried, and half of the eight nominations were given to their representatives, including the Governor. Josiah W. Begoll was nominated for Governor, and Eugene Pringle for Lieutenant-Governor. A platform containing civil-service reform and free-trade planks was adopted. The River and Harbor Bill, in so far as it made appropriations for objects not of national importance, was disapproved.

An Independent Republican ticket has been nominated in Maine, and a platform adopted which demands a reform of the civil service, faithful execution of the liquor and Sunday laws in the State, strict economy in the expenditure of public money, and the reduction of taxes. It opposes Machine politics of every form.

A Trade and Labor Convention, held in Philadelphia on Monday, endorsed the Greenback nomination of Mr. T. A. Armstrong for Governor.

In Texas the Republican Convention opened with 410 delegates, on Wednesday, 250 of whom were negroes. A platform was adopted pledging the support of the party to the Independents.

The Missouri Republican State Committee have decided not to call a Convention, but a call will be issued independent of them in a few days.

The Arizona Republicans held a Territorial Convention on Wednesday, and nominated Judge De Forest Porter as delegate to Congress. The platform favors smaller Indian appropriations, and approves of disarming the tribes.

The Democrats of Delaware have nominated C. C. Stockley for Governor.

A large number of Congressional nominations have been made during the week. There is a split in the Republican party ranks in a Louisiana district, in which Senator Kellogg is one of the candidates, and in Congressman Houk's district in Tennessee. Hannibal C. Carter, a negro, has declared himself a "Straight-out" Republican candidate for Congress in the Second District of Mississippi, against Chalmers, the Independent.

It is asserted by a respectable negro voter of Alabama, and confirmed by a white lawyer, that the story of a plot of the negroes of Choctaw County to murder all the whites in the county is a fabrication, put in circulation as an excuse for the hanging of a negro who was an active Republican.

The American Association of Science opened its annual session in Montreal on Thursday. The attendance of delegates from all parts of the United States and Canada was very large. The retiring President, Prof. George J. Brush, delivered an address on "The Progress of American Mineralogy." Dr. Dawson, of Montreal, is the new President. Four hundred of the delegates made an excursion to Quebec on Saturday.

The American Forestry Congress held a session in Montreal during several days last week. It adjourned on Wednesday, to meet next year probably at St. Paul, Minn.

A Convention of Free-thinkers was held at Watkins Glen, N. Y., during the week. Among the business transacted was the adoption of a decalogue, and the appointment of a committee to consider the matter of the establishment of a Liberal University somewhere in the United States, and to report at the next annual meeting.

The Tariff Commission held sessions in Boston for several days last week. Representatives of many industries appeared before them and presented pleas for the regulation of duties.

In the Star-route trial at Washington the arguments are drawing to a close. On Wednesday Mr. McSweeny concluded his facetious argument for the defence. On Thursday Mr. Merrick began his address for the prosecution. In his opening remarks he demanded the conviction of the Dorseys, Miner, Vaile, Rerdell, and Brady, but frankly expressed a doubt as to Turner's knowledge of the secrets of the conspiracy, and his consequent guilt. His argument was one of the most effective of the trial. He concluded on Monday, and was succeeded by Mr. Wilson for the defence.

The drawing for the allotment of the new three per cent. bonds was begun at the Treasury Department at Washington on Friday.

Mr. Chandler, Secretary of the Navy, continued his tour of inspection of the Navy-yards along the coast, in the *Tallapoosa*, during the week. Newport was visited on Wednesday. He formally accepted Coaster's Harbor Island for the United States on Saturday.

Rains in the West have improved the corn prospects, but have created considerable anxiety for the safety of the wheat yet in shock. An expert who has investigated the corn crop in Nebraska says that, if permitted to mature, it will be the largest ever produced there.

Fishery Inspector Kiel, of Kingston, Ontario, has stopped Americans fishing in Canadian waters, on penalty of having their boats seized.

Every effort is being made to prevent the spread of yellow fever in Texas. A sanitary cordon from Corpus Christi to Laredo is being enforced by the customs authorities. The Post-office Department has issued orders for the fumigation of all mails in that district. There is a decrease in the number of new cases at Matamoras, Mexico. At Brownsville there are more than 100 victims of the disease. One case has appeared at Pensacola, Fla.

Doctor Woodward, of the United States Army, one of President Garfield's physicians, is in very bad health in Europe, and has received no benefit from his trip.

Doctor Bliss, President Garfield's chief physician, has presented a bill to the Board of Audit, which has charge of the expenditure for the President's illness, for $25,000. He estimates that his services cost him fully $15,000 in loss of practice during the time he was attending the President, and thinks that he should, in addition, receive reasonable compensation for his professional services.

Ex-Governor Sprague, of Rhode Island, prevented the purchaser of "Canonchet," his mansion, from taking possession, on Friday, by having a force of armed men posted at all the approaches to the grounds.

There was an explosion and fire in the Erie Railway Company's elevator, at Buffalo, on Thursday night. Five lives were lost, and more than $400,000 of property and grain destroyed.

Forty persons were drowned at Ben Ficklin, Texas, on Thursday, by an inundation.

Richard B. Garland, who killed a young man named Addison, in a lovers' duel, near Lunenburg, Va., recently, was acquitted of the charge of murder on Thursday. The jury only deliberated about fifteen minutes.

A picnic held at Chicago on Wednesday, for the purpose of raising funds to build a monument to the memory of John Brown, was a failure in a pecuniary point of view. Only 300 persons were present, including Mrs. Brown.

William Boekel, who was agreed upon by the Keely Motor Company and John W. Keely, of Philadelphia, to receive the inventor's secrets, has filed a report in the Court of Common Pleas in that city, in which he asserts that Mr. Keely has undoubtedly discovered a new force or motive power, and that it possesses properties peculiar to itself and wholly phenomenal, and therefore requires much time and patience before it can be mastered. He will continue his investigations until he is able to construct one of the motors without the assistance of the inventor.

The Rev. George W. Musgrave, D.D., LL.D., one of the most prominent clergymen in the Presbyterian Church, died in Philadelphia on Thursday, at the age of seventy-eight. He was a trustee of Princeton College and a director of the Theological Seminary. He was one of the most earnest supporters of the movement which resulted in the reunion of the Old and New-School Presbyterians in 1870.

Charles Mallory, the well-known shipbuilder and shipping merchant, died suddenly at his home in Mystic, Conn., on Saturday morning, at the age of eighty-five. His property is estimated at $1,000,000. His son is the head of the firm which controls the Mallory line of steamships, of this city.

FOREIGN.

General Wolseley has carried on the campaign in Egypt during the week with great activity and gratifying success. By Wednesday evening the British forces held the Suez Canal throughout its entire length. On that day the water in the fresh-water canal at Ismaïlia began to fall perceptibly, and it soon became apparent that Arabi had diverted its course. A notice was immediately issued requesting economy in the use of water. Nineteen Greeks who were pillaging in the Arab quarter there were arrested on Wednesday, and ten were shot. On Thursday General Wolseley began a rapid march from Ismaïlia into the interior. A false report was telegraphed to Alexandria, on that day, that Tel-el-Kebir, with 2,000 prisoners, had been captured. While the Household Cavalry were on the march, on Thursday, they were shelled by the enemy with some effect. Sunstroke has caused a number of deaths among the British soldiery. A despatch was received by the British War Office on Friday, from General Wolseley, giving the details of an engagement at Magfar on Thursday, in which he held his ground the whole day against 10,000 Egyptians. His force numbered 2,000. He said: "I advanced this morning before daybreak with the Household Cavalry, two horse-artillery guns, thirty mounted infantry, 1,000 men from the York and Lancaster regiment, and the marines. After some skirmishing I took possession of the dam which the enemy had constructed across the canal between the villages of Magfar and Mahuta. During the operations two squadrons of the Household Cavalry charged the enemy's broken infantry very gallantly. I soon found that the enemy were being largely reinforced from Tel-el-Kebir. All day long I have had an Egyptian force of 10,000 men, with ten guns, in my front and on my right flank. The precision of the enemy's artillery fire was very good, but fortunately they fired common shell nearly all day, and when they did fire shrapnel their fuses were badly adjusted. Our horses, having been recently on board ship, were not in condition to gallop much. The two horse-artillery guns were served with pluck and ability. Our casualties have been slight." On Friday evening he again telegraphed that he had pushed on again at daybreak. He said: "The force at my disposal this morning was the First Division and all the English cavalry, with sixteen guns. My intention was to pivot on my left at the dam we took yesterday, and swing round my right to take the enemy's position in the flank and drive them into the fresh-water canal, sending the cavalry completely round their position to occupy the railway in their rear, and, if possible, capture their engines and rolling stock. This operation was very well carried out. The enemy seem so demoralized, and so averse to await the attack of our infantry, that it is possible they will not make the determined stand I anticipated before we reach Zagazig. The Guards, under the Duke of Connaught, made a very trying march yesterday across the desert." The enemy's loss is estimated at about 400.

A new Egyptian Ministry was formed on Monday, with Sherif Pasha as President of the Council and Minister of Foreign Affairs, Riaz Pasha Minister of the Interior, Haidar Pasha Minister of Finance, and Omar Lufti Pasha Minister of War. Ramses and Mahsama were occupied on Friday by the British. The engagement was not serious. The total forces now in the Ismaïlia district, under General Wolseley, are about 11,000 men, 2,500 horses, and twenty-seven guns. Mahmud Fehmy, Arabi Pasha's chief engineer and military adviser, was captured on Sunday, at Kasassin. The British troops are rapidly advancing, and an early attack on Tel-el-Kebir is expected.

On Monday evening a body of Arabs attacked the British position at Kasassin, and were repulsed with heavy loss. Eleven guns were captured.

In the neighborhood of Alexandria the military activity has not been so great. Intrenchments were thrown up on the extreme right of the enemy, across the sands toward Lake Abukir, as a protection against a flank movement by the British. Several hundred Bedouins entered Ramleh on Thursday and plundered a number of houses. The absence of balloons for military purposes is much felt in the neighborhood of Alexandria. Sultan Pasha received information, on Thursday, that a strong feeling exists among the people of Upper Egypt against Arabi, because of his exactions. There was an unexpected hitch in political matters at Alexandria on Saturday. Riaz Pasha, who was summoned from France by the Khedive to engage in forming a new Ministry, refused to take office if the Chamber of Notables is to be restored, as he considers that institution unsuited to Egypt.

About 3 o'clock on Sunday afternoon the Egyptians on the left bank of the Mahmudieh Canal, near Alexandria, were shelled by guns of the Waterworks Hill. The British man-of-war *Minotaur* also shelled the Egyptian outposts near Abukir, and forced a retirement. At Meks the Bedouins appeared in force, and continued to raid the village during the night, murdering the inhabitants.

At Abukir fort on Wednesday, an officer and twelve men from the Austrian gun-boat *Nautilus* were sent ashore, under the supposition that the English were in possession, as a white flag was flying. They were immediately made prisoners. They were released on Saturday, on condition that they would not reveal anything they had seen.

It is rumored that Arabi Pasha accuses M. de Lesseps of having deceived him with false promises, so as to be able to sell the Suez Canal to the English, and that he has set a price on De Lesseps's head.

Cairo is still quiet. The Committee of Vigilance sits daily. All the members, except two, support Arabi.

The Nile began rapidly rising on Wednesday, and the inundation of low points is proceeding. A blockade of the Egyptian coast was established on Friday.

The hesitation of the Sultan to sign the military convention with England is said to be principally due to the receipt of threatening letters from Syria, Arabia, and Egypt. On Wednesday the Sheikh-ul-Islam held an interview with Lord Dufferin, in which the latter explained that he had received instructions from his Government to sign the draft of the military convention as agreed upon, on August 18, by himself and Saïd Pasha. This explanation, it was understood, helped to clear the situation somewhat. The Porte on Wednesday withdrew its objection to the exportation of mules from Smyrna for British service in Egypt. It was reported on Thursday that Germany had advised the Sultan to come to an understanding with England in regard to the military convention, as coöperation with that nation was the only means of defeating Russia's plans. But Saïd Pasha and Assym Pasha advanced fresh demands on that day, to the effect that the Turks should land at Alexandria, and that the proclamation relative to Arabi, instead of declaring him a rebel, should summon him to submit to the Khedive. On Friday Lord Dufferin informed Saïd and Assym that his Government was prepared to waive the demand that any movement of the Turkish troops must be first approved by the British. Saïd Pasha then suggested that the Turks should make Alexandria, which the English would evacuate, their base of operations, while the British base should be Ismaïlia.

Saïd Pasha went to Therapia on Sunday evening, and informed Lord Dufferin that the Turkish Council of Ministers had resolved to publish the proclamation against Arabi, and to accept the military convention with England, conformably with Lord Dufferin's proposals. The text of the convention was drawn up and agreed upon on Tuesday. It will probably be signed within a few days.

A fight between Greek and Turkish troops, over disputed territory, occurred on the Thessalian frontier on Wednesday. Four Greeks and eight Turks were killed.

Fearful rioting has occurred between Hindoos and Mohammedans at Salem, in the Presidency of Madras, India. Mohammedans were tortured and killed, their houses burned to the ground, and their principal mosque destroyed. Troops have restored order. One hundred and fifty Hindoos and three Mohammedans have been arrested.

Mr. Trevelyan, Chief Secretary for Ireland, in a speech at Belfast on Wednesday, when the Mayor presented him with an address of welcome, said it would be idle to deny the existence of personal danger in the task of governing Ireland. The remedy against outrages was to have a tribunal which could be trusted to do justice. Those who expected agrarian murders to cease suddenly were expecting an impossibility. The fixed policy of the Government was to distinguish between criminal and political acts. Against the former they were determined to wage unrelenting warfare. Mr. Trevelyan's remarks were received with cheers.

Earl Spencer, Lord-Lieutenant of Ireland, has declined to interfere with Judge Lawson's course in the case of E. Dwyer Gray.

Charles James Kirkham, one of the chiefs of the Fenia conspiracy, and a writer of tales, poems, and political essays, died near Dublin, Ireland, on Wednesday, at the age of fifty-seven.

A committee is forming in London to arrange for placing a bust of the poet Longfellow in Westminster Abbey.

The Emperor of Russia has sanctioned the statutes of the Moscow Society for developing the cotton industry in Central Asia.

"VOLUNTARY CONTRIBUTIONS" AND THE REPUBLICAN PARTY.

JAY HUBBELL has issued another assessment circular to those who have paid no attention to the first. In this he manifests his surprise at "the failure to respond" to the first one, but suggests that it may have been due to what he calls "the pressure of other cares." He concludes by expressing the hope that the return mail will bring him "a voluntary contribution equal to two per cent. on your annual compensation." The impudence of all this is, of course, what strikes one at first on reading it. In any other walk of life than politics, a second circular from a man who had asked you for two per cent. on your income, as a "voluntary contribution" to something in which he was interested, expressing his surprise at not having heard from you, and again mentioning the amount he expected to receive from you, "by return mail," would lead to his receiving a pretty stern rebuke in very uncomplimentary language. But, "inside politics," nothing seems absurd, or ludicrous, or impudent. Politicians like Hubbell now neither blush, nor laugh, nor even wink, and you could not explain to them in a year why it was funny to threaten or rebuke a man for not giving you "a voluntary contribution."

It is not their stupidity, however, which is interesting in the present case so much as the accounts they give of the condition of the Republican party. This last circular, emanating, be it remembered, from a Congressional Committee, announces that we are "on the skirmish line of 1884, with a conflict before us of great moment to the Republic, and that a repulse now is full of danger to the next Presidential election." Nevertheless, it says that the Committee, at a crisis so momentous, "cannot hope to succeed in the pending struggle if those most directly benefited by success are unwilling or neglect to aid in a substantial manner." No such confession as this has come from any official quarter certainly in the twenty years during which the party has been in power. What it means is that the hold of the Republican party on the votes of the majority, and therefore on the Government of the Union, will be seriously weakened, unless the officeholders pay two per cent. on their salaries to a fund to be expended by men who render no accounts, and in whose honesty nobody has much confidence. The Congressional Committee actually avows that it no longer counts on the devotion of the voters to the principles of the party, or on the confidence inspired by its past administration of the national affairs, or even on the old-fashioned favorable comparison between it and the Democrats. It has no reliance now except on voluntary contributions of two per cent. on their salaries from "those most directly benefited by success." In other words, the Republican party, put in power by the burning enthusiasm of the best portion of the American people for a great idea, and kept in power for twenty years, by their passionate conviction that in its hands alone was the national salvation sure, can now only be maintained by a round sum in cash. It has been handling some billions of public money, but its life now depends, it seems, on its being able to raise a few thousands from its own employees.

It appears, too, according to the Congressional Committee, that it is no longer the party voters, or the nation at large, who are "most directly interested in the success" of the party, but the 100,000 poor men who draw salaries from it. To Hubbell and his confederates the party is interesting simply as the source of a certain amount of money; and they think that nobody's devotion to it can any longer be counted on with certainty, except those who get something from it in cash monthly. It seems as if it was audacity which led them to lay all this before the voters. But it really is not: it is the stupidity of men trained under the spoils system to look on the public funds as primarily the reward of electioneering dexterity, and only secondarily as a means of getting the public business transacted. This, too, probably accounts in a large degree for what seems so surprising—the constant protestations of their innocence put forth by Brady and Dorsey. They very likely cannot persuade themselves that their frauds were really frauds, in view of the services which they think they have rendered the party in its canvasses.

When we take the admissions of these Hubbell circulars in connection with the Arrears of Pension Act and the River and Harbor Improvement Act, it must be admitted that the younger voters of the party, at all events, have abundant food for reflection. The solemnity of the occasion is heightened by the spectacle of the Massachusetts Republican delegation, Senators and all, having to submit explanations, with which their constituencies are anything but satisfied, of their conduct in helping to pass an enormous job over the President's veto. Ten years ago this would have been considered an amazing phenomenon; it does not now seem to excite much surprise in inner party circles. But there must be change, and purification, or there will be a revolution which will leave the Hubbells with no one "most directly interested in success" to levy on. No party can stand in this country on a purely money basis, and no party which has lost the moral confidence of the voters can be saved by "two per cent. of your annual compensation."

THE MONOPOLIST AND THE STRIKER.

JAY GOULD, when conversing with reporters, is almost always what is called "a well-spoken man." In fact, he gives much evidence of containing the materials of one of those philosophic observers, called Sages, who receive interviewers in the comfortable homes to which they retire in their old age, and explain to them the true nature and bearing of the various political and social phenomena of the day. In an interview with a *Herald* reporter on Saturday last, touching Governor Cornell's troubles, he defined his position toward political parties and politicians almost in the language of the Sage.

"'I am,' said Mr. Gould musingly, 'independent of either party in politics. I have large interests at stake in this country. Nearly all my money is embarked here in various enterprises, and all I want is honest government. I am being continually 'struck,' as they say, by politicians.' Pointing to a nest of drawers, he said, 'Those pigeon-holes are filled with the demands, the threats, the entreaties of politicians—men of all parties and no party, Republicans, Democrats, Anti-Monopolists. If you were worth a million dollars and a directing agent in some corporate interest, you would soon find out and understand the force of what I mean.'"

We presume that, with one little exception, this is a strictly accurate account of his attitude. The little exception is to be found in the assertion that all he wants "is honest government." Here Mr. Gould erred, though probably not intentionally. He has not often occasion to use the term "honest," and probably never has examined closely the sense in which other people use it. He has observed, however, that they always apply it to something they like and approve of, and has probably come to suppose that what they mean by it is something agreeable or advantageous to the person using it. Accordingly, what he doubtless has in mind when he says he desires "honest government," is government favorable to the execution of such financial or industrial schemes as he may for the time being have on foot.

This, there is no doubt, he has steadily pursued during the whole of his remarkable career. It is now over twelve years, indeed, since he revealed his political philosophy to a committee of the New York Legislature, by admitting that when necessary he bought up or gave money indifferently to whichever party was likely to be most useful to him in business. In every Presidential campaign of late years, he has always contributed liberally to the side he thought likeliest to win—indeed, in 1876, was a prominent worker in the Republican Committee rooms. In the last campaign he began, we believe, with great confidence in Garfield's triumph, but, seeing reason a little later to change his mind, made a handsome contribution to "carry Indiana" for Hancock. There is nothing very extraordinary in this. If Gould did not believe that the best party was the party most likely to be useful to Gould, and did not ostentatiously support it for this reason, he would not be Gould, but some one else. It was his steady refusal to acknowledge that there was a right and wrong side to things, independent of the pecuniary return they brought in, which first made him known to the world, and his defiance of the popular prejudice has worked so well for him that he is not likely to abandon it.

It would be doing him great injustice (or more than justice, if any one likes the phrase better), if we said that he is now, such as we see him—one of the great political and financial forces of the day—the product solely of his own moral or immoral ideas. The truth is that he may be said to have sown his own seed. The manure which made him such a splendid growth was furnished by the politicians or "strikers," as he most truly and candidly observes. Neither Gould nor any other monopolist would be what he is—that is, the dread and envy of the stock market and the terror of the produce exporter—if he were not made aware of the extent of his power

and tempted into the abuse of it by the efforts of needy political adventurers, and blackmailers, and managers, to "strike" him, or, in plain English, to extort money from him. We have no doubt whatever that "those pigeon-holes" to which he pointed do contain enough to give even a high-minded and generous and upright man a profound contempt for the whole class known as politicians. It is not surprising if, in the case of a man like Gould, they give him a contempt for human nature itself, and make him look on professions of political morality as simple cant. All notedly rich men in every country have experiences, which are both comical and melancholy, of the capacity for begging and blackmailing which is distributed through every community. There are thousands of persons of both sexes who seldom hear of a man's coming into possession of a great fortune without unblushingly asking him to gratify, not wants only, but simple desires or caprices.

At mere rich men, however, such politicians cannot get. It is only when they represent, or are largely interested in, large corporations, and these come to have need of legislation, or become liable to suffer from legislation, that the political striker sees his opening, and begins to "assess." He has been providing, or trying to provide, himself with funds in this way now for the last fifty years. He began to levy his tolls in this State as soon as charters of incorporation began to be valuable, and would have converted the State government into a sink of corruption but for the passage of the general act which enables corporations to be formed without his permission. His performances in the same line by means of special legislation and the tinkering of city charters are well known, but his direct attacks on commercial corporations have now to be confined to taxation. What he does in these ways is, however, we imagine, trifling compared to what he does by private threats and applications.

The evil, too, is growing as the corporations grow in number and magnitude. Their need of friendly legislation is a great mine for the striker, but not so great as their exposure to hostile legislation. It is, indeed, an outgrowth of the assessment system, or directly connected with it. Party managers have long been in the habit of assessing Government contractors, as well as Government employees, on the general principle that everybody who derives any direct pecuniary advantage from the Government is bound to contribute money to the party in power. Such a principle, of course, easily and indeed naturally covers the case of those who seek favors from the Legislature, or whom the Legislature might damage. Every member of Congress in this case has the power of contributing to the result on one side or the other, and so has everybody who "owns" a member of Congress, and every "worker" and "henchman" who helps to nominate him, and exerts any influence over him. The number of those, therefore, who are able to establish claims, however shadowy, on the Monopolists' favor is very large, and they are pushed with childlike frankness. If the Monopolists, indeed, were to publish the contents of "those pigeon-holes," we are inclined to believe that we should be surprised at their moderation, and ready to acknowledge that their rule over us is, on the whole, gentle and merciful, considering what their views of human nature must be.

THE MERCHANT MARINE OF ITALY.

Of all the European states, Italy alone has shown in recent years any decided decadence in her merchant marine. Mr. Wells, in his treatise on the American merchant marine, makes mention of this fact, and states that between 1869 and 1879 the decrease in Italian shipbuilding was officially reported at eighty per cent.; and, during the same period, no fewer than 50,000 men connected with Italian shipbuilding and navigation were obliged to seek other employments; and, further, that the decrease for the year 1879 alone amounted to 529 vessels. This decrease, however, appears to have been due to the long period of depression which acted upon the foreign commerce of Italy between 1874 and 1880, and cannot be taken as an indication of the normal condition of the Italian marine. In other words, the causes of the decrease were in great measure of a temporary nature, and were due to the general economic condition of the country. In the last year there has been a marked improvement, and an increase has occurred in the steam tonnage, which was before the weakest point of the Italian merchant navy; for while it possessed in sailing vessels a tonnage of more than 1,000,000 tons, the tonnage of its steam vessels, which had never exceeded 30,000 tons, at present amounts to upward of 110,000 tons. If, then, with the return of prosperity, the merchant navy also shows signs of activity, and even of increase, where is the need of resorting to any such costly expedient of fostering shipbuilding and the navigation of vessels, as has been adopted on such a large scale in France in the form of bounties or premiums—an expedient which has been more than once proposed in this country, and which still finds favor among a certain class who desire to produce by artificial means what should and can be brought about by natural causes?

In 1880, when public attention had been directed to the condition of the merchant navy, a committee of the Italian Chamber of Deputies was appointed to examine into the condition of the mercantile marine, the causes of its decadence, and the remedies for the situation. The action of France in entering into a very extensive system of bounties exerted a strong influence in this inquiry, and has materially colored the conclusions of the Committee. After sitting for more than a year and a half, the Committee has just made its report, which, together with the testimony taken, fills four large volumes, and appears at a time when the conditions which called it out have entirely changed, and have given place to a new set of conditions. Still, the results of the inquiry are by no means devoid of interest, for they clearly show that what is needed in Italy will apply with almost equal truth to the United States. In short, apart from some special causes, it is a false and vicious fiscal policy that prevents in both cases the development of an industry which would at first sight appear to be specially adapted to the nations in question.

Thus, it is a well-established fact that steam vessels are superseding sailing vessels, yet little attempt is made in Italy to keep up in this point with the rest of the world. Again, iron vessels, though more expensive in the first cost, are in the end cheaper than wooden vessels. But, while Italy possesses marked advantages for the construction of wooden vessels, as yet the number of her iron-ship builders is very small. Thus there is no large force of skilled labor for constructing iron vessels. The orders for such vessels are so few that there has been no occasion for erecting and maintaining extensive shops and ship-yards, for all the needed materials may be obtained from England, where iron and coal are cheaper; and this, too, in spite of the far lower wages of Italian labor. This roundabout way of procuring such materials entails expense and delay. As the law now stands, iron vessels constructed in other countries, and all materials used in the construction of vessels, are admitted free of duty; but, notwithstanding these advantages, it is asserted that the tariff policy effectually prevents the manufacture of such materials on a large scale within the country. Moreover, the system of taxation employed in Italy is such as to discourage the investing of capital in steam vessels, and even to favor the construction and maintenance of sailing vessels. For while a sailing vessel pays but a light license duty, which is proportioned to the value of the vessel, a steam vessel must pay a tax of thirteen per cent. upon the revenue derived from her, and this, too, whether engaged in the home or foreign trade. Again, the stamp duties on the papers necessary to the construction or sale of a vessel are so heavy as to discourage dealings in vessels, and there is a tax on maritime insurance. The Commission also directs attention to the fees of Italian consuls in foreign ports as an onerous charge on shipowners.

The Committee, however, does not stop with merely recommending a reduction of these taxes and charges on the mercantile interests of the country, but, captivated by the example of France, it proposes an even more extensive system of bounties on the construction of vessels, and premiums on their navigation, than was adopted by that country. For example, while not favoring bounties on the construction of sailing vessels, it would allow the premiums of navigation to vessels engaged in a coasting trade in the Mediterranean, whereas those of France are intended specially to encourage ocean voyages. It proposes a bounty on all steam vessels constructed in Italy, proportioned to the tonnage of the vessel and the power of her machinery. Of the expense to the state of this system of bounties there is a somewhat startling discrepancy in the estimates made by the various members of the Commission, the annual charge on the treasury being variously placed at five, six, eight, and ten million lire. If the example of France can serve as any guide, it is very likely that the last figure will be reached, if not exceeded.

It is doubtful, however, if the recommendations of the Commission will ever be carried into effect, unless another marked decrease in the number of vessels in the Italian mercan-

tile navy should occur. For at least a year must elapse before the Government can act upon the report, and in that time a further improvement may take place, and all necessity of any such factitious aid to the mercantile interest may be done away with. Should it, moreover, become recognized that the burden of a foolish and ill-advised fiscal policy is one of the prime causes of a decay of the merchant marine, and that Italy is not alone in possessing such a policy, then a revival must follow under a natural and unrestricted system. The causes of decay are of an artificial nature, and it is because they are artificial that there is any hope of reviving the merchant marine, and of maintaining it in the face of foreign competition. Bounties, premiums, and differential duties are barbarous methods of attaining a like end; but they are costly, and, like cologne, will but cover a bad smell that only needs the application of common soap to remove.

SCIENCE AT MONTREAL.

MONTREAL, August 26, 1882.

MONTREAL is welcoming for a second time the American Association for the Advancement of Science, and with generous hospitality. The older members recall the fact that in 1857 the Association met here under the Presidency of Alexis Caswell. This year the well-known geologist Principal Dawson is the presiding officer. The attendance is large, especially from the United States. Among the men of note from across the ocean the most conspicuous are Dr. W. B. Carpenter, the physiologist from London (whose younger brother, Philip, no longer living, is still honored in Montreal for his scientific attainments), and the Rev. Dr. Haughton, of Trinity College, Dublin, whose versatile mind has been directed to a great variety of interesting questions—mathematical, mechanical, geological, and mineralogical. Besides these may be mentioned Dr. Valdemar Kovalevski, Professor of Geology in Moscow; Dr. Rae, the Arctic explorer; Dr. Koenig, of Paris, the investigator in sound; and Mr. Fitzgerald, a Dublin physicist. Herbert Spencer's coming has been announced, but he is no longer expected. Two of the former Presidents—W. B. Rogers and L. H. Morgan—have died within the year, and the faces of some of the older members, who are still active in their scientific careers, are missed from the assembly; but there is a strong and well-trained body of young men who have already come to the front, and are winning honors in fields both new and old. Without a count, it appears that the colleges of the Western States are particularly well represented, and that comparatively few of the professors in the older Eastern institutions are here, though among this number are some of the very foremost workers—Dr. Asa Gray and Professor James Hall, for example.

The interest of the meeting has its central point in McGill College, where ample facilities are afforded for every kind of business pertaining to the meeting. The Principal of the college, Dr. Dawson, is the President of the Association, and the occasion is rendered still more noteworthy by the completion of a new college building—the Peter Redpath Museum for Geology and Natural History—a commanding edifice which gives dignity of appearance to the unpretentious group devoted to the other purposes of the institution. Near by is the elaborate Gothic structure of the Presbyterian Theological College, some of whose rooms are occupied without any "conflict" by the teachers of science.

To the general observer the opening day was the most interesting of the session. First came the ceremonious introductions, when the dignities of Church and State met the dignities of science upon the same platform and interchanged courtesies. Dr. Sterry Hunt, in behalf of the local committee of Montreal, gave on this occasion an admirable introductory address, and Principal Dawson, on taking the chair, made an excellent plea for the recognition of the trained young men, not yet widely known, but deserving of generous encouragement. The most liberal hospitalities of a prosperous city were extended to the guests from a distance.

In the evening, notwithstanding rain, a large hall was filled to hear the annual address. The retiring President, Professor Brush, of New Haven, selected a theme in his own department, and treated it like a master. His discourse was a good illustration of the tendency of scientific men to limit their work to a special line, and to avoid general observations upon the fields which they have not personally tilled. What is lost in one direction is thus gained in another: for breadth we have depth, and what *is* said is spoken with authority and not by an echo. Mr. Brush was honored by the Association with the place he holds against his own protests; and his friends may strongly suspect that he was not eager to give the formal address which the Association exacts of its chosen head. But there was nobody in the Congress, and not more than one person in all the land, so competent as he to review the history of American mineralogy, and to point out the requisites for the further prosecution of the science. This was his subject.

He began with a notice—which must have surprised nearly all his hearers—of the state of inquiry respecting the mineral resources of this country early in this century. It is hardly credible that in this recent period the most intelligent observers were so inadequately informed respecting the problems which most deserved to be investigated. In a very appreciative spirit, and yet in calm and judicial terms, he next referred to the four pioneer mineralogists of America, to whom much of the later science is due—Archibald Bruce, of New York; George Gibbs, of Newport; Parker Cleaveland, of Bowdoin College; and Benjamin Silliman, of Yale College. Touching but lightly on their personal history, he pointed out how the initiation of a journal of mineralogy by the first-named, the remarkable collections of the second, the able treatise of the third, and the power of the fourth in lecturing and teaching, gave an impulse to their favorite studies. There were indications, in this part of the address, of the care with which the speaker had studied the dawn of American mineralogy, and his selection of four types of investigators was felicitous and instructive.

He then proceeded to the second quarter of the century, and showed the aid which came to the science from private munificence, Governmental surveys, and the opportunities of communication afforded by the *American Journal of Science*, and also from instruction in mineralogy and the formation of cabinets. Here he made an entertaining allusion to what he called "the first summer school of science"—a flotilla of canal-boats, which Amos Eaton, with the financial aid of Stephen Van Rensselaer, conducted through the Erie Canal, teaching his class of students to observe and describe all the natural phenomena of that water-way when the route was new. Dr. Gray afterward mentioned that Joseph Henry was among the pupils in that Eaton flotilla.

Then the speaker, as if the whole country were his cabinet, rapidly called attention to the developments made in the field which our mineralogists have worked, to the geographical distribution of American minerals, to the discoveries which have been made since the early days referred to, and to the variation of American from European species. He did not miss the opportunity to fire a passing shot at the disposition hastily to describe new species; there was a tone of regret in his voice when he said that, relatively, there were fewer mineralogists now than there were sixty years ago, and that more of the old-time spirit of true research was needed in these days.

Mr. Brush refrained from the mention of living American mineralogists, with the single exception of Dana, *facile princeps*, but he mentioned that in an appendix to his address there would be printed, both as a warning and an encouragement to investigators, the names of al the proposed new American species and of their sponsors

Perhaps a few words more should be added on the latter part of this address. A marked feature of American minerals, said Mr. Brush, is the grand scale upon which crystallization has taken place—common mica in sheets a yard across, feldspar where a single cleavage plane measured ten feet, prisms of beryl four feet long—and so in general much larger crystals than those obtained from European localities. Another noteworthy fact is the occurrence, in abundance, of some of the rarer elements as constituents of the minerals found. For example, among the rare earths, glucina, zirconia, etc.; lithium occurs in our lithia micas, and spodumene, containing from five to eight per cent. of lithia, occurs by the ton in at least one locality. Among rare metals which form metallic acids, columbium, the first metal new to science discovered in America, is found from Maine to Georgia. Many other examples were given, including the rare metal tellurium, which is found in Colorado in one locality, where masses of twenty-five pounds have been taken out. Yet only a small portion of the United States has been thoroughly explored, and we are far behind Europe in the variety of minerals obtained from our mines. The careful inspection of quarries and mines is much to be desired, rich sources for minerals, where valuable material is in danger of being buried out of sight. If our trained mineralogists would oftener go into the field, and if our wealthy amateurs would aid in exploring American localities as freely as they engage in importing costly specimens from Europe, they would do much to foster science.

The address closed with a brief defence of the place which should be accorded to mineralogy as a science, independent of chemistry and geology, but "interdependent" with them, and also with physics.

In the afternoon of Wednesday the introductory addresses were given by heads of the nine sections into which of late the Association has been divided, and as these nine heads are Vice-Presidents of the Association, it is a current joke to speak of them as the nine capital Vices of American Science. It is a bad arrangement which gives so many of these addresses at the same hour, for they are of general interest, and almost every attendant would be glad to hear more than one of them. If the Secretary, Professor Putnam, who is admirable in all his arrangements, could hereafter secure the delivery of these papers in one room, at successive half-hours, I am sure he would reward the speakers with larger audiences and would give the hearers much additional pleasure. I listened to a capital written address, by an eminent man, whose views were entitled to great respect and were on a subject of universal interest, but he spoke to a baker's dozen, and saw his address attributed next morning in the newspapers to another gentleman who was not present at the delivery.

The address in the Mathematical and Astronomical section was read for its author, Professor Harkness, of the Naval Observatory, on the Transits of Venus. It was an historical and, to a moderate extent, a critical review of what has been hitherto done in the observations of such transits, with particular reference to the results attained in 1874 and to those which are to be expected in 1882. Dr. H. C. Bolton, of Trinity College, gave a review of the recent work of the Chemical section, and then took for his theme the history of chemical literature, especially in its early aspects. Mr. E. B. Elliott, the statistician of Washington, introduced the work in Economic and Statistical Science by a statement of the province which this new section is designed to fill. In Physics the speaker was Professor Mendenhall, of Columbus, O., who was formerly in Japan, and he made an address on the methods to be pursued in teaching physics in colleges. Professor W. P. Trowbridge, of Columbia College, in the section of Mechanics, made a strong plea for the promotion of experiments in mechanics, in close connection with theoretical studies. He dwelt upon the extraordinary demands now made by the public on engineers, and gave many illustrations of what experiment has done, and instances of what it may do in the future, to determine problems of profound importance. In the Biological section, Dr. W. H. Dall, of Washington, gave an account of what has been accomplished in this country toward a knowledge of the biology of the molluscs. In the related section of Histology and Microscopy Professor Tuttle, of Columbus, O., questioned the propriety of a special microscopical section, and in the section last to be named, the Anthropological, a paper by Dr. Daniel Wilson, of Montreal, was read on some of the physical characteristics of certain native tribes in Canada.

I shall not attempt to repeat the titles of papers which were subsequently read. As nine sections are simultaneously in session, no one can hear more than a small portion of what is presented, and a great deal of time is lost by going from one hall to another. This is part of the embarrassment of abundance. A great deal of curiosity was manifested to hear Mr. A. Graham Bell on the use of an induction balance in detecting the presence of metal in the human body—a line of inquiry into which he was brought by the attempt to discover the position of the ball which destroyed the life of President Garfield. The students of natural history gathered round Dr. Asa Gray with enthusiasm as he reviewed the history of the study of the American flora, with sketches of the original work of Michaux, Pursh, Torrey, etc., with some mention of his own labors, and with instructive hints as to that which remains for younger botanists to undertake. The Geological section is always well attended, and the communications of Hall, Dawson, and Carpenter gave importance to its meetings this year. Besides these speakers there was Dr. Rae, with a valuable account of his Arctic explorations, and Commander Bartlett, of the United States Coast Survey, with a wonderfully interesting résumé of the results he has reached within the last two or three years in the study of the Gulf Stream, as to its currents, its depth, and its temperature. Professor Dwight, of Vassar College, brought before the section a new collection of fossils which he has discovered in a locality hitherto unnoticed near Poughkeepsie. In the Physical section the most remarkable paper was that of Professor Rowland, describing the new gratings which he has made at the Johns Hopkins University for the study of the solar spectrum. He exhibited the results obtained by these gratings in photographs of the spectrum, which far surpass any that have hitherto been made. The ethnologists listened to an account of some personal observations upon the inner tribal life of the Omaha Indians which have been made by Miss Fletcher during her residence among them.

These are but notes of a few papers which attracted general attention; those which were of interest to special workers were quite as numerous as ever.

It is always entertaining to hear the conversation of those who attend these annual congresses as to their value and their deficiencies. Some of the best scientific men in the country are very shy of them, believing that science is to be promoted by hard work in quiet hours, and that its results are to be communicated to learned bodies and placed on record in careful memoirs, rather than announced to popular assemblies and reported in the newspapers. There is no doubt that the gaining of momentary applause is a very unworthy motive to inspire intellectual exertion, and many a capable person is impeded for life by yielding to the insidious temptation to be popular and to be talked about. There is also no doubt that many second-rate productions are brought forward in such assemblies as this. But there is another side to the matter. The opportunities which are afforded to the scientific men of this country and of Great Britain, France, Italy, and Germany, by their annual summer conferences are very great. Acquaintances are formed among those who are working in the same line, the younger men have easy access to those who have won renown, the older men discover the youths who are of promise; many a call to a professorship, many an appointment on a scientific investigation, has turned on such introductions as these meetings afford. The specialist who is in danger of becoming narrow, is liberalized by contact with other workers; early information is obtained of inquiries not yet enough matured to be published; suggestions and counsels are freely interchanged. Probably the professors at Harvard and Yale, and the residents of New York and Washington, and other great cities, do not need for themselves, to any great extent, the facilities which these conventions afford, for they live all the year among active workers; but those who are far away from their co-workers, remote from sympathy and light, are quickened more than can be estimated by such gatherings as this. Doubtless also the local scientific activity is increased in every community where the Association meets by the presence of so many who are wise and bright. I am confident, too, that young men are often led to enter upon scientific pursuits by the magnetism of personal examples with which they become acquainted in just such a gathering as this. As an educational force the advantages far surpass the drawbacks. A shrewd observer has just said in my hearing that some of the best impulses in American society proceed from these great conventions of the friends and promoters of science.

The generous and informal hospitality of Montreal has received grateful recognition on all sides. Excursions have been arranged to Ottawa and Quebec, to which hundreds of persons are devoting Saturday; private houses have been freely opened to guests; the Local Committee on one evening, Principal Dawson on another, and the Art Association on a third, offered evening entertainments. Public lectures are promised by Dr. Carpenter on Deep-Sea Soundings, and by A. Melville Bell on Visible Speech. The number of persons enrolled as in attendance is more than eight hundred.

PACIFIC FRANCE.

PARIS, August 12, 1882.

A CURIOUS transformation has taken place in France since 1870: this country, once so fond of war, has become intensely pacific. The memories of the invasion cannot be forgotten: the hostages taken from their quiet homes and conducted to the distant fortresses of Germany; the soldiers quartered for months in the cities and villages; the daily requisitions of hay, bread, meat, cigars; the terrible contrast between the organized order of the invaders and the disorganized state of a country deprived of all legal government and reduced, as it were, to its own primitive elements—such things make a deep and lasting impression upon the minds of a laborious and quiet population. Then, after the period of the invasion, came the period of reorganization: the Prussian military laws were copied, as if the germ of victory was in a military law; compulsory, universal military service became the order of the day. The country accepted this terrible necessity, but an army recruited from all parts of the population is very different from an army of volunteers. Every young man pays his debt, as the saying is, to his country: but he is very apt to think that after having spent some time amid the tedium of barrack life, the debt is paid. He returns to his family and his occupation with delight, and the idea of being recalled is a nightmare to him. I do not at all pretend that if our reserve men were recalled, they would not all hasten to their regiments—I am convinced that they would. They go to the manœuvres with the greatest alacrity; they are, as a rule, orderly and law-abiding; but they have, not unnaturally, the feeling that they ought not to be recalled without a very adequate reason, without an actual national necessity. They are not deficient in national honor, but they are ignorant of general politics; they live in their provinces, and their horizon does not extend across the frontiers of France.

The new France—the France of universal suffrage—became warlike during the Second Empire, because it had virtually abdicated into the hands of the Emperor Napoleon III. He had a sort of trust, which he fulfilled to the country's satisfaction for a certain length of time. I remember seeing once Napoleon III. at the beginning of his reign (not long after he had said, "L'Empire, c'est la paix!") at a representation of Rossini's "William Tell." There is a scene in which young Arnold, tempted to follow the fortunes of the Austrian, discusses with Tell; he sings to him,

"La gloire remplace aussi la liberté."

I remember seeing Napoleon III., who was generally very cold and without enthusiasm, applauding this sentiment with great energy; so much so that everybody looked at him. He had destroyed liberty—he felt that he owed something to a great country: he intended to feed us with glory. France had her share of glory in the Crimea and in Italy, but then came the useless wars, and next came the final reverses. The country had followed Napoleon III. to the end, but as soon as fortune left him, she left him also. The present electoral body is composed of the generations which form the active army, the reserve of the active army, the territorial army, the reserve of the territorial army. All the men, in fact, between twenty and forty, know that if France had a real war, they would have to leave everything and to fight. Such an electoral body cannot be warlike—it must be pacific; all the more so because there is an almost exaggerated sentiment throughout the country as to the great efficiency of the forces which

would be likely to be brought against France in time of war.

The Tunisian war, which was the first serious military affair of France after 1870, caused some consternation in the country, but this sentiment of uneasiness did not last long. The country was told that it was no war at all. The population of Tunis is very docile, much more so than the population which fought for many years against France in Algeria. The new Governor, M. Cambon, who is a man of merit, is administering as well as he can with the many difficulties which were created for us by the Treaty of Bardo, and which are created every day by the capitulations, and by the pretensions of the foreign consuls. France would have done much better to annex Tunis immediately than to sign the Treaty of Bardo; the international financial commission greatly embarrasses the reorganization of Tunisian finances. Time, however, will settle many questions. Nobody thinks any longer of Tunis except, perhaps, the Italians; they will some day or other console themselves with Tripoli.

The Tunisian affair gave a start to public opinion in France. The then Minister of War would not make any mobilization; he would not even call out the men who are called *disponible* (that is, the men of the active army who in ordinary times serve only six months, who can be called by a mere decree of the Minister of War, without any vote of the Chambers, and who number, in five classes, about two hundred thousand). He was obliged to undo all the regiments, to take soldiers here and there, and to make of them regiments *de marche*, which were totally wanting in homogeneity.

The Egyptian affair required very different means. It was at first the intention of the French Government, when M. Gambetta was Prime Minister, to make an expedition with England on what may be called common terms, as France and England once made the Crimean War. There was to be complete identity in their military as well as in their diplomatic action. Before these plans were completely matured Gambetta fell from power, not on the Egyptian question, but on that of the *scrutin de liste*. His successor had a difficult task: he was conscious that the country was not in favor of a war policy; at the same time, he did not wish to break all the diplomatic threads of the negotiations with England. After a long period of hesitation, which has been too well described in a long despatch from Lord Granville to Lord Dufferin, he tried to subdivide the Egyptian question, and to cut it, so to speak, in two. To England alone was reserved intervention in the valley of the Nile, the landing at Alexandria, the expedition against Cairo, and the settlement of the internal difficulties of Egypt. France and England were to work hand-in-hand on the Isthmus of Suez; they were to protect together the independence of the Isthmus, and to defend the Canal, if necessary, against the Bedouins and the forces of Arabi Pasha. This was a sort of military continuation of the old financial condominium; it was not war, it was probably merely an occupation. M. de Freycinet had a double object: he would say to France, "We are not undertaking anything difficult—a few ships and a few regiments simply will suffice; we are not beginning a military expedition to the Delta." He could turn to Europe, and say to her, "I am your guarantee against the ambition of England. The French flag will float over the Isthmus of Suez together with the English flag. I will in this way assure the independence of this great commercial road, which has become so essential to Europe and to Asia, which is a sort of common road uniting the two largest fractions of the human community. It is idle to speak theoretically of the neutrality of the Suez Canal if the English are alone to show themselves at Suez, at Port Saïd, at Ismaïlia. The presence of a few French soldiers will be worth any amount of protocols."

This policy had, of course, its dangers as well as its advantages; the dangers chiefly were felt by the French Chamber. The small credits required by the Government for the little expedition to the Isthmus were rejected by an overwhelming majority. To be sure, in this majority were all the friends of M. Gambetta, who has been all along in favor of a much more active policy than M. de Freycinet's, and would have, if he could, sent not 4,000, but 40,000 men to Egypt. There is no doubt, however, that the temper of the Chamber was misunderstood by M. de Freycinet; that it was for peace absolutely, and that all the talk about the influence of France in Egypt seems to this Chamber mere empty talk. Such a state of things, such a callous indifference to what once occupied constantly the attention of the French Government, seems almost scandalous to all the diplomats of the old school, to all those who belong, in any capacity, high or low, to the Foreign Office, to all our consuls abroad, and, more than that, to the few men in our Chambers who still live on tradition, whether these men are Republican or Royalist.

I take Gambetta as an instance. He is the leader of a great Republican faction, but he has been brought up in a certain atmosphere of traditions. Such men as M. Waddington, who once made a long journey in the East, have a distinct idea of the value of the words "French influence in the East." The great majority of the Deputies elected to the present Chamber by universal suffrage care no more for Egypt than if Egypt were in the moon. They have their own concrete notions about taxes, about land, about civil law, about a hundred things; they are many of them lawyers, educated in the routine of provincial life; they do not know the first word of foreign affairs, and they know that their electors know even less. So it happens that negotiations are conducted by ambassadors of the old type, by clerks of the Foreign Office, who know every treaty which has been signed for the past two hundred years; and when the result of this elaborate and skilful work comes before the Chamber, the Chamber destroys it in an hour. This new and extraordinary state of things will in the end produce a certain sort of diplomatic isolation of France. Why should foreign Cabinets concern themselves with the Penelope's work of our diplomats? This isolation will not be without some advantages; for, as the Duc de Broglie well said the other day in the Senate, a great country is felt by its absence as well as by its presence. Negative forces are still forces; and the French Democracy is perhaps more clever than it is aware in letting all the Powers of Europe entangle themselves in difficulties which it ignores. The time may come when the memories of the late war will be effaced, and when French Democracy will feel its claws like a young lion. The present generation will, in all likelihood, not see that day.

WUERZBURG'S TRI-CENTENNIAL.

WUERZBURG, August 4, 1882.

NORTHERN Bavaria offers an unusual number of attractions to the Continental tourist this summer. In Nürnberg there is the great Industrial and Art Exposition, which opened in June and will close in November; in Bayreuth the festival performances of Wagner's "Parsifal" cover the period from July 26 to the end of August; and in Würzburg we are now in the midst of the celebration of the three-hundredth anniversary of the University, which is one of the best frequented in Germany, the average number of students in each semester being about 1,000. The city has been most gayly decorated for several days, there being few houses, and in the finest streets barely even a window, without a flag or a bunch of flags. Statues have been covered with wreaths, and flaglet-encircled poles erected in the public squares, connected by long green garlands. The greatest variety prevails, as well as tasteful arrangements, for we see the colors of the German flag, black-white-red, contrasting with the Bavarian white-blue, the Franconian red-white, the Würzburger red-yellow, and the various colors of the students' clubs or "corps," suspended from the windows of resident "Philistines" who once studied at the University. Most luxuriously adorned are the public buildings, all at the city's own expense, as the State Government refused the appropriation of ten thousand dollars which were asked for the worthy celebration of the jubilee, including also the renovation of some parts of the old, dilapidated University buildings. The Government even refused one-half the sum asked for, but consented to place the interest on this sum at the disposal of the Faculty for the assistance of meritorious students. The funds for the festival were accordingly made up of voluntary contributions from all parts of the country, added to the 20,000 marks which the city itself contributed. As far as I can gather from the contradictory accounts, it was through the influence of Staatsminister von Lutz that the money asked of the state was granted in the form of scholarships, instead of being added to the festival funds; and for this manœuvre it seems he was punished by the Faculty, who defeated by a large majority the proposal to confer on him an honorary degree. Indignant at this refusal, the local Liedertafel (vocal society) elected him an honorary member; and thus the matter was amicably arranged.

It must not be inferred from these incidents that the Bavarian Government is stepmotherly disposed toward its second-largest University. On the contrary, large sums are annually contributed toward its maintenance, and even now a handsome building in connection with the botanical department is in process of erection. It is to the scientific and medical departments that the greatest attention is paid, as the majority of students are of the latter. During the last semester there were in the medical and pharmaceutical department 594 students, in the law department 148, in the theological 168, and in the "philosophical" (natural science, mathematics, philology, philosophy) 166. The University possesses a library of over 250,000 volumes, excellent laboratories, interesting artistic, zoölogical, mineralogical, and biological collections, an astronomic observatory, and a botanic garden. The predominance of the medical department is accounted for by the existence of the admirable Julius Hospital, which was founded by the same bishop who in 1582 founded the University, and to whom a fine statue has been erected in the Julius Promenade by Schwanthaler. This hospital is one of the largest and wealthiest in the German Empire, its property being valued at more than 9,000,000 marks. It has room for 700 persons, and gives the students excellent opportunities for clinical practice.

Besides these advantages and the corps of seventy-two instructors, including some famous names, there are other things that attract students to this city. Würzburg has about 53,000 inhabitants (7,000 Protestants and 2,000 Jews), and is therefore fourth in size of Bavarian cities, Munich having about 200,000 inhabitants, Nürnberg half that number, and Augsburg over 60,000. The older part of the city, like Nürnberg, presents a thoroughly mediæval aspect,

while the modern additions are suggestive of the handsomest new streets in Munich. The royal Residenz, with its Doric colonnades, 312 rooms, and 947 windows, situated in the midst of an elegant Anglo-French park, with a large open square in front, is one of the most imposing sights of its kind in Germany. The city itself, with all its towers, can best be viewed from the Marienberg, on the left side of the Main River, which is crossed by a curious narrow bridge almost four centuries old, and "adorned" with twelve statues of male and female saints. The Marienberg was formerly the residence of some of the eighty-two bishops who have ruled over Würzburg. It is now used as an arsenal and barracks—institutions which have in size and significance gradually usurped the place of cloisters, although of these, too, several may still be seen in this vicinity, four for monks and two for nuns. The visitor to the citadel is allowed to pass through several massive doors and underground passages until he is received at the top by a guard who hands him over to a captain, by whom he is assigned a subordinate officer who, for a small fee, shows him the building, the best views, and the ravages caused by the Prussian bombardment in 1866, 235 years after the Swedes had taken the fort with all its immense treasures, which enabled them to continue their devastation of Germany.

A still more extensive view is obtained from the Steinberg to the left, commanding attractive hilly surroundings, and a glimpse up and down the river, but by no means so picturesque as Bayreuth or Heidelberg. Of the Steinberg every inch is occupied by vines which yield the famous Steinwein—like the Leistenwein from a neighboring hill, equal to the best Rhine wine. This is a matter of some importance to Würzburg, for it makes one of the greatest differences between itself and the capital, which it otherwise copies. In Munich there are few places where a glass of good wine can be had, while here every tavern and beer-house keeps it at a reasonable price. If the present festive time may be taken as a specimen, it would, nevertheless, seem that the Würzburgers drink fully as much beer as their brethren in Munich. Immense quantities of "Festbier" were especially brewed for this occasion, and kept on "Lager" for seven months; and yet fears were entertained that the supply might give out before the festival was over, in accordance with a prophecy made some time ago by an old gypsy woman, that at this festival a calamity would happen greater than the world had yet seen. I doubt, also, if the students here drink as much wine in preference to beer as they should, in accordance with Bismarck's maxim that wine should become the national drink of the Germans, because beer makes them stupid and phlegmatic. Not content with drinking beer all night, the typical student devotes the best morning hours to it, and not infrequent are the cases where such a Frühschoppen, or morning-beer, begins at 10 in the forenoon and ends after midnight. During the jubilee days the past and present members of the various corps, as well as non-society students, announce their daily places of meeting for a Frühschoppen in the morning papers; and for this Frühschoppen the majority prepare themselves by a glass of Apollinaris or Cognac, to obliterate the effects of the preceding night's debauch.

It cannot be said that this constant drinking improves the physiognomy of the students. Refined, aristocratic faces, such as are frequent among Harvard students, are rarely seen here; and the fact that there are no tailors in Germany who can cut a suit does not improve their general appearance, any more than their ugly scars gained through silly mediæval absurdities. It is curious to see so many old men in Würzburg this week wearing the red-white-blue or green caps of the corps to which they once belonged. Oddly inadequate as these caps are for protection against the sun or rain, there is no harm in them. They enliven the aspect of the streets and afford much innocent amusement to tourists in much-frequented places like Heidelberg. In other respects, too, the Würzburg corps student does not differ from other German students. He is rarely seen without a cane and a dog, which is invariably treated with great consideration. He lives in a little room in a poor quarter of town, and makes love to the pretty daughter of his hostess; pays four times as much for his beer as for his dinner; disturbs everybody at midnight by his howling, and for this offence hates the policeman with all his soul; carefully avoids lectures except shortly before examination or to shun his creditors, who seek for him everywhere except in the lecture-room; and, finally, calls every one who is not a student or who does not approve of all his idiosyncrasies an "old Philistine."

But I must return to my centennial festivities. Invitations had been forwarded to the King and various members of the aristocracy and Government, to the rectors or representatives of German, English, Scotch, French, Dutch, and Scandinavian universities, technical high schools, academies of arts, lyceums, gymnasia, etc. All these guests were received at the station and assigned lodgings in the houses of professors and others on the day preceding the festivities, Monday, July 31. On Tuesday morning there were services in the Catholic and Protestant churches and the synagogue. The Catholic service included a mass by Cherubini and a Te Deum by Vogler and a festival sermon by Dr. Hettinger. In the afternoon there was a "garden festival" and ball. On Wednesday morning the principal ceremony took place. All the invited guests assembled in the University Church, where an historical address was delivered by the present rector of the university, Dr. Wislicenus. This was followed by the presentation of honorary degrees to various German and foreign notabilities, among whom may be named Professor von Sybel, Professor Ihering, Dr. Siemens, of London, Sir John Lubbock, Professor Huxley, Alexander Bell, M. Charcot, and M. Ranvier. In the afternoon a banquet was given to all the invited guests, at which speeches were made by Duke Carl Theodor, Minister von Lutz, and others. It cannot be said that any of these speeches displayed such fine wit and eloquence as we are accustomed to at our Harvard dinners; they consisted mostly of empty phrases about Alma Julia, the festival, and the King, contrasting in this respect with the rector's address in the morning, which was really admirable.

All these proceedings of the first two days were only for invited guests. On Thursday came the great public event which brought thousands of strangers and many special trains to the city—an historical procession. Preparations for this had been made months ago, some sixty operatives, for instance, having been engaged for weeks on the 700 archaic costumes alone. The procession was to begin at 9 in the morning, but as it rained was postponed till 3 in the afternoon; and a better hour could not have been chosen, for it was the beginning of the only few hours of continuous sunshine known in these regions for almost two weeks. The promptness with which the hour of starting was kept was probably more due to the fear of another shower than to anything else. At 2 o'clock all the chosen streets were thickly lined with people, among whom were not a few peasant women in their great-great-grandmothers' bell-shaped costumes, who might easily have joined the procession without being accused of the crime of anachronism. The procession was headed by some of the guests on horseback, followed by a herald, twelve trumpeters, three standard-bearers, and the festival committee. Then came an historical group representing Würzburg and its inhabitants just as they were three hundred years ago, all the trades and industries being represented in appropriate costumes and with various signs and symbols indicating their occupation.

Twenty-nine trades altogether were to be counted in the procession. I cannot stop to describe them all, but can only call attention to a few of those which attracted special attention because they had wagons on which their work and workshops were exhibited—the carpenters engaged on an unfinished building; the gardeners, in whose floral chariot sat a young girl on a throne of flowers; the fishermen, with a sort of ship for a wagon; the gilded chariot, with allegorical figures impersonated by young girls representing the city. These groups, like those following, were at regular intervals separated by brass bands. Before the gilded chariot just mentioned came a group of fifty-four girls of good families, arrayed in the becoming dress of their ancestors three centuries ago. Some of them seemed rather embarrassed at being the focus of so many eyes, and their cheeks were burning red; but others were apparently so well pleased with their costume that they retained it when they appeared in the evening at the banquet halls. The same was the case with the tradesmen, who all mingled with the people in the evening and gave the streets the aspect of a masquerade. The second historical division embraced soldiers, huntsmen with their dogs, students in elegant array, citizens and patricians, a merchant's wagon with military guard, etc. The professors, the invited guests, and the students with special corps standards borne on horseback, constituted the remaining groups. It took the procession over an hour and a half to pass a given point, and it was 7 o'clock before the groups separated at the Residenzplatz. The "cellar festival," a sort of civilized bacchanal, which was to have taken place this same afternoon, was postponed till to-day, but as it is raining it will probably again be deferred, as well as the torchlight procession projected by the students for this evening.

Correspondence.

ERRORS OF THE CENSUS.—II.

To the Editor of The Nation:

Sir: In a former communication mention was made of certain errors in Table I *d*, on page 5 of the Census Volume containing the Statistics of Population, and of contradictions between Table I *m*, on page 17 of the same volume, and the map showing the curves of mean annual temperature. In the present letter, attention will be called to errors and contradictions in the maps, tables, and discussions of the density of settlement at different periods.

The volume under consideration contains, among others, a series of ten maps, one for each Census year. These maps show, in five degrees of density, the distribution of population at the time of each enumeration. The first degree indicates a population of from 2 to 6 to the square mile, the second from 6 to 18, the third from 18 to 45, the fourth from 45 to 90, and the fifth 90 or more to the square mile. The population of all cities having 8,000 inhabitants or more is excluded in calculating the density of settlement. These cities are designated on the maps by circles of solid color, in size proportional to the population of the city intended to be represented. For

the purpose of illustrating more fully the distribution of population in 1880, there is a map in ten sheets, which shows such distribution in ten degrees of density. This map is on a larger scale than the one for the same year in the series already described. I shall, for convenience, refer to the larger map as the "section map." Following the method of the Census volume, I shall call the degrees of density above described classes or groups of settlement. These explanations seemed necessary to make clear my meaning in much that follows.

In the first line at the top of page xxv, it is said that group 3 is the "predominant" one in Maryland. In the very next paragraph, it is said that Maryland is one of the States in which group 4 is "found in excess of any other." On pages xxvii and xxviii, Table X gives the area of each of the groups in each State and Territory in 1880. According to this table, of the 9,860 square miles of land surface in Maryland, 3,000 square miles were in group 3, and 6,860 square miles in group 4. The map for 1880 seems in this respect to support the table, the area in No. 4 on the map being very decidedly greater than that in No. 3. The mention of Maryland as one of the States in which group 3 is "predominant" is, therefore, incorrect.

On the same page (xxv), it is stated that, in New Jersey, group 5 is "in excess of the sum of all other groups." The settled area of New Jersey, according to the table (X, pp. xxvii and xxviii), was 7,455 square miles. Of this area, 3,065 square miles were in group 5, 2,440 square miles were in group 4, and 1,950 square miles in group 3. The sum of 2,440 and 1,950 is 4,390. "The sum of all other groups" in New Jersey, according to the table, is 1,325 square miles "in excess" of group 5—which flatly contradicts the statement quoted from page xxv.

In the fifth line below Table IV, on page xxv, the following sentence occurs: "It should also be noted that in the decade previous the increase of No. 2 was comparatively slight." Mention had just before been made of the decade between 1860 and 1870; the "decade previous," then, must have been that from 1850 to 1860. Table IV, just above, gives the area of group 2 in 1850 at 294,698 square miles. In 1860 this area had increased to 353,341 square miles, the increase during the decade being 58,643 square miles. Now, the area of group 2 in 1790 was 83,346 square miles; in 1880, it was 373,890 square miles. The increase in nine decades was 290,544 square miles; the average increase during each decade was 32,282 square miles. It would from this appear that "in the decade previous the increase of No. 2 was comparatively "*great*. A study of the table and the context will show that the mistake is in the number of the group. The sentence was doubtless intended to read: "It should also be noted that in the decade previous the increase of No. 1 was comparatively slight."

Table X (pp. xxvii and xxviii) places the entire area of Maryland in groups 3 and 4. Both the maps indicate that the great bulk of Baltimore County in that State, besides a small part of Harford and Cecil Counties, is in group 5. The area of Baltimore County is 600 square miles (see Special Census Bulletin on Areas, p. 15); its population in 1880 was 83,336 (see p. 64). It contained no cities or towns of 8,000 or more inhabitants (see pp. 204, 205, 207, 208). It had, therefore, in 1880 a population of 138 to the square mile. The table (X, pp. xxvii and xxviii) should have credited some 500 or 600 square miles of the area of Maryland to group 5.

The map places a section of Georgia to the south of Atlanta in group 5. Now, as the Census volume tells us (p. xxv), group 5 exists only where "manufacturing and trading villages are numerous." We are, of course, desirous of learning the exact extent of this thickly-settled portion of the South; but on turning to the table (X, pp. xxvii and xxviii) it will be discovered that the entire area of Georgia is put in groups 1, 2, 3, and 4. The section map indicates that the very part of the State which the main map places in No. 5 is really in No. 4. The map-maker has blundered: "manufacturing and trading villages" are not yet numerous enough in Georgia to support a population of 90 to the square mile.

The map marks a tract of land lying on both sides of the boundary-line between Kansas and Missouri, as in group 5. The development of the former State has unquestionably been very rapid, but it would hardly have been anticipated that any part of it had in 1880 more than 90 inhabitants to every square mile. That such should be the case seems even harder to understand when another glance at the map shows that group 4 has no existence in the State. One portion of Kansas would thus appear to have a population of 90 to the square mile, and all the rest less than 45. The table (X, pp. xxvii and xxviii) credits 290 square miles of the settled area of Kansas to group 4, and none to group 5, which latter group, according to the table, does not exist in Missouri either. Now, 290 square miles would seem to be about the area of that portion of Kansas which the map places in group 5. The explanation of the contradiction suggests itself: the maker of the map put "V" where he should have put "IV."

We have already seen that the maps purport to mark cities of 8,000 inhabitants or upward by circles of solid color. On the map for 1870, Cumberland, Md., with a population of 8,056 (see p. 204), Frederick, Md., with a population of 8,526 (see p. 205), and Madison, Ind., with a population of 10,709 (see p. 151), are properly designated. In 1880 these cities each had over 8,000 inhabitants, Cumberland having 10,693 (see p. 204), Frederick, 8,659 (see p. 205), and Madison, 8,945 (see p. 151). The first and last-named do not appear at all on the map for 1880, while Frederick is represented by a hollow circle such as is used to mark places like Meridian, Miss., whose population was 4,008 (see p. 235), and Prescott, Arizona, whose population was 1,836 (see p. 99).

The case of Raleigh, N. C., is still more curious. In 1870 its population was 7,790 (see p. 284). In 1880 it had 9,265 inhabitants (see p. 284). The draftsman "has left undone that thing which he ought to have done, and has done that thing which he ought not to have done." On the map for 1870, Raleigh is represented by a circle of solid color, on that for 1880 by a hollow circle.

There is a strange and very serious error in the map for 1870. That map indicates that in that year there was not a city west of the ninety-seventh meridian with 8,000 or more inhabitants. In point of fact, there were eight cities whose population exceeded 8,000. Their names, population in 1870, and the authority for that statement of population, are given below:

Name of City.	Population.	Authority.
San Francisco, Cal.	149,473	Page 109
Oakland, Cal.	10,500	" 107
Sacramento, Cal.	16,283	" 109
Stockton, Cal.	10,066	" 109
San José, Cal.	9,089	" 109
Portland, Oregon	8,293	" 304
San Antonio, Tex.	12,256	" 341
Salt Lake City, Utah	12,854	" 352

This blunder cannot be considered an unimportant one. The map conveys to a person looking at it an entirely erroneous impression of the social and industrial condition of the western half of the country in the year 1870.

I do not pretend to have mentioned all the mistakes in these maps and tables. Space will not allow me to speak of all that I have discovered, and I have no reason to doubt that there are many that have escaped my somewhat hasty examination. In my next letter I hope to point out errors in some of the other maps and their corresponding tables.

JOHN C. ROSE.

BALTIMORE, MD.

THE ADMINISTRATION AND THE STAR-ROUTE PROSECUTION.

TO THE EDITOR OF THE NATION:

SIR: In your issue of the 17th inst. you say: "Mr. Carpenter's address to the jury on Monday was one of the most impudent harangues ever delivered in a court of justice. He denounced the Attorney-General for appearing in the case, and denied that it was possible that the President could have instructed him to prosecute."

There is, sir, an error in the foregoing which should not have occurred in a public journal professedly conducted upon principles of impartiality, and aspiring to a place above the level of mere sensationalism. I did no injustice to the Attorney-General. In manner and form, I treated him with the respect due to his reputation and experience. I did suggest, and truly, and as I had a right to do, that his appearance in the case was without precedent in our history; but if you will examine the report of my argument as it is printed, you will not fail to discover that the word "denounce," as applied to the remarks in question, is not appropriate.

The Attorney-General of the United States, in the prosecution of a cause in an inferior court of criminal jurisdiction, can have no other status than that of assistant of, or substitute for, the regular prosecuting officer. There surely have been cases of more importance to the public than the one here considered—cases to which the United States was a party—in no one of which did the Attorney-General see fit to appear. Aaron Burr was tried for treason, and, in two instances, persons charged as the assassins of Presidents have been held to answer, and yet no Attorney-General deemed himself called upon to interpose. I did take the liberty to infer from this exceptional and most significant circumstance, that there was an underlying, undisclosed motive in the proceeding. I did suggest that the prosecution was a political rather than a judicial affair. I did deny that the President had any rightful authority or influence in determining the result; that he had, either personally or vicariously, standing or voice in the tribunal; that he was, in any sense, a judicial officer; and so I still deny. I hold, moreover, that any intervention of his in a judicial proceeding, whether by direct action or informal influence, would be a usurpation of power denied to him by the Constitution, and an outrage upon the party against which it is exercised. I did contend that the duty of the jury was to found its verdict upon the evidence, and that all other matters should be rigorously excluded from their consideration; and, as this is in accordance with a principle as old as the common law, I fail to discover the justice of your criticism.

The journalistic mind of the United States has become so enlisted for the conviction of the defendants, that it seems to have parted with what power of discrimination it previously possessed. As if the safety of the republic, or the respectability of the American people in the eyes of the rest of mankind, depended upon such conviction, it has been inclined to approve of whatever agencies or influences might be employed to insure the desired result, irrespective of their legitimacy. If the reprobates—as it deems them—of the Star-route connection cannot be brought to face their deserts without a departure from the forms and maxims which have hitherto obtained as conservative of the rights of the accused, let

there be such departure. It has become a custom of the press to characterize the deportment of the prosecuting counsel as all that is mild, ingenuous, and conciliatory, while that of the defending is described as all that is rude, acrimonious, and dictatorial. The addresses to the jury upon one side are represented as eminently candid, impartial, and veracious; those upon the other as exceptionally ill-tempered, ambidexterous, and sophistical. There has not been this difference. The dividing line between urbanity and incivility has not been coincident with that between the defence and the prosecution. The defence has thought it matter of imperative duty to animadvert with some severity upon the palpable enlistment of Executive authority and influence as a factor in the prosecution; and, if examples were needed to demonstrate its right so to do, they could be cited in abundance. I do not expect to silence the thousand tongues of error clamoring through the press in all parts of the country; but, in consideration of the character of the *Nation*, I have ventured to offer so much by way of vindication and correction.

Very truly yours, R. B. CARPENTER.

WASHINGTON, Aug. 26, 1882.

[The Attorney-General must be allowed to judge whether a case calls for his appearance in it or not. There is nothing improper, *per se*, in his appearance in any case, and it is certainly not open to the counsel for the defence to object to it because it is "unprecedented." The case itself is unprecedented. No other has occurred in which a leading officer of the Government has been charged with swindling the Government on an immense scale, in collusion with a United States Senator and the Chairman of the National Committee of the party in power. Such a charge is far more serious and more dangerous to the state than either treason or murder, and from its very nature more difficult to prove, and therefore needing more attention from the law officers of the Government. Moreover, the President's former relations, both political and personal, with Dorsey and Brady, make it imperatively necessary that he should leave nothing undone to satisfy the public that he honestly and earnestly seeks to have them brought to justice. There has been a great deal too much "abuse of the plaintiff's attorney" in the case already.—ED. NATION.]

THE IRREPRESSIBLE CONFLICT IN OHIO.

TO THE EDITOR OF THE NATION:

SIR: The writer of the brief notice of Senator Sherman's Mansfield speech in your last issue seems to understand but imperfectly the situation in Ohio. The pith of that paragraph lies in the oft-repeated statement that in such matters as temperance public sentiment is higher than law, and that public sentiment tends toward "tolerance."

The temperance Republicans of Ohio—and all agree that they constitute the moral strength of the party—do not seek for laws in advance of public sentiment. What is the gauge of public sentiment? The ballot. We ask that the sense of the people be taken on this great question. If a majority of the voting men of Ohio want free whiskey, and a Sunday given to debauchery, we shall submit, and wait until public sentiment can be elevated. But if a majority are ready to vote for restrictive enactments, that is the sign that public sentiment sustains such laws. You may be sure astute politicians like Sherman and Foster would not embarrass their party with this question if they did not know that there is public sentiment behind it.

But this public sentiment "has its fits and starts, and always develops itself in the way of tolerance." These fits and starts occur in reference to all laws. It is safe to say that throughout the country one-half the actual violators of law go "unwhipt of justice," screened, to some extent, by a kind of public sentiment. In regions haunted by the late lamented Jesse James public sentiment, with a certain large class, "tolerated" robbery; but that public sentiment tends toward such tolerance, who can believe? No one has proposed to interfere with a man's having wine or whiskey on his own table—that is his undisputed right. But drunkenness all civilized nations recognize and punish as a crime, and we venture to affirm that public sentiment will be less and less tolerant of that as man advances. So of the drinking den. There may be in Europe, or may once have been, liquor-sellers of the type of the wily Miss Napier in 'Robert Falconer,' but their date is out. The liquor-dealers with whom we have to do are simply bent upon their gains, and they are the great corrupters of the public morals. Society must be reformed by moral means, to be sure, but it was demonstrated in the Washingtonian movement, as often since, that moral means can only win a partial and insecure victory, unless sustained by law. The strongest public sentiment will not suppress or control your saloonist, unless it is crystallized into law, precisely like the sentiment against robbery.

Now, the saloonists of Ohio have had things their own way and scorn control. The regulations imposed upon them have been few, and purposely devised in such a way that they could not be enforced. There are no such restrictions as are prevalent even in Germany. Governor Foster (and he is not even an abstainer himself) publicly declares that "the traffic goes unrestrained, . . . and as a consequence there is hardly a family relationship in the State but counts at least one victim to this horrible traffic. . . . And the action of the liquor-dealers raises the question as to whether the (existing) law shall be enforced or not. They openly defy the law."

Is not here an "irrepressible conflict"? Will public sentiment ever tolerate such a condition of affairs as the Governor has described? It is refreshing to lay aside the petty and personal squabbles which so generally characterize State politics, and take hold of a real issue, one promising to check this business, which is the cause, according to Governor Foster, of nine-tenths of the crime and poverty of our State. Shall we not by so doing rob the low politicians of one great source of strength, and do our part toward ushering in that political millennium of which the *Nation* is the herald?

Very respectfully, WM. G. FROST.

OBERLIN, O., August 21.

DECAY OF THE FIGHTING PASSION.

TO THE EDITOR OF THE NATION:

SIR: I was much interested by your comments upon Mr. Nadal's statements in regard to the "fighting passion," as shown in Byron's heroes, for example; a passion the manifestation of which is known to be greatly diminished in our time, and especially in this country.

While admitting the "commercial" element of which you speak as a powerful factor in bringing about our national amiability, may I ask if there are not other reasons quite as effective in the suppression of individual resentment, which result from the conditions of modern democratic society? First among these conditions perhaps is more a complete organization, by virtue of which protection from injury, and avenging of insults, are lodged with officials. A man accustomed to pay taxes for the protection of public and private safety is less likely to risk resisting an attack from a ruffian, by force of muscle or use of pistols, than he is to call for the police, or to seek his revenge in the law-courts. In other words, his personal injury is atoned for by legal remedies.

Again, has not the general use of fire-arms introduced an element in personal encounter which handicaps terribly the attempt to revenge one's honor? Prowess, as opposed to powder, is at but sorry odds; and brave men nowadays seem to have acquired a habit of appealing to common sense, if there is room for any appeal at all in an attack upon life, property, or one's good name. It is difficult on other grounds to account for the tame submission of large companies of men to the command of one masked villain with a revolver — circumstances in which the instinct of commercial shrewdness would be little involved, as even the most sanguine of "commercial travellers" would have but slender hope of effecting a trade with the threatening ruffian.

With these and other kindred causes operating in our social life is to be remembered, in regard to the great mass of the population, the obliteration, not so much of individual resentment, as of the *individual himself*, in the nineteenth century. More than of old, men hesitate to do the spontaneous thing. They are more self-conscious; they look to see what others are doing; they intrench themselves in the security of the crowd, of which they form a part. One hardly ventures to affirm that the high organization which gives compactness and power to the whole body, may diminish vigor of character in any one of the component parts. Yet, at our present stage of development, it would seem as if some such cause accounted partly, at least, for what Mr. Howells has called "our greatness as a nation and our weakness as a people."

S. W. W.

BEVERLY FARMS, August 21.

Notes.

GEORGE H. ELLIS, Boston, will issue next month an American edition of Miss Frances Power Cobbe's new work, 'The Peak in Darien.' The name is derived from the last essay, of which the alternative title is, "The Riddle of Death."

S. C. Griggs & Co., Chicago, promise, in their "Philosophical Classics," 'Schelling's Transcendental Idealism,' by Prof. John Watson, of Queen's University, Kingston.

Judge Tourgée's paper, *Our Continent*, has purchased and absorbed *Potter's American Monthly*.

Dr. Edward Eggleston's papers on "Life in the Thirteen Colonies" will begin in the November *Century*. They will be curiously illustrated.

The second part of vol. iii. of the Proceedings of the Davenport (Iowa) Academy of Natural Sciences contains a paper on the "Inscriptions on the Davenport Tablets" (supposed aboriginal relics), by Professor Seyffarth, which will confound the persecutors of the Chinese in this country. From some of the letters on these interesting stones he concludes boldly that "it is self-evident that America must have been populated by the next [nearest] nations, of course by the Japanese, Coreans, and Chinese." The Academy lost last December its devoted President, Mr. Joseph Duncan Putnam, and the third and concluding part of this volume will be entirely occupied with a memorial tribute to him.

A curious survival is the Official Catalogue of that German General Exhibition of Public Hygiene and Life Saving at Berlin which broke down last spring in consequence of the burning of the main building. It is a thick duodecimo, and, what with its lists of exhibitors and their articles and its advertisements, it has an obvious value even without the show. The Exhibition will be revived next spring, and the publishers, Messrs. Theodor Fischer and Julius Springer, promise a new catalogue in due season.

The leading articles in *Le Livre* for August are of an even and excellent quality. L. Derôme paves the way for bibliomaniacal competition for "first editions" of the tragic poet Crébillon, who has hitherto been, he holds, too much neglected in this regard. M. Eugène Muller, of the Arsenal Library, tells with much learning of the lucky find of three unpublished letters of Voltaire's, addressed to the Comte d'Argenson in 1754, seeking his protection against the possible unhappy consequences of the unauthorized printing of the 'Abrégé de l'Histoire Universelle.' These letters were discovered in a copy of Voltaire's 'Annales de l'Empire,' presented at that time to the Count, and form a series with one published by Beuchot in his great edition of Voltaire's complete works, and erroneously supposed to have been addressed to the Count's nephew, the Marquis de Paulmy. The entire episode is very interesting. Pleasant reading, also, is M. Eugène Forgues's contribution to the papers on the book-illustrators of the present century, his subject being Gigoux, who still survives, a venerable figure but little bent with years. As usual in this series, specimens are given of the artist's designs (to 'Gil Blas') and his portrait—a very French face—capitally reproduced from a crayon by himself. In a lighter vein is M. Ch. Collet's "The Old-Bookseller Achaintre and the Medical Student," but not uninstructive withal.

The August number of the *Journal of Dramatic Reform*, issued by the Dramatic Reform Association, of Manchester, England, contains an essay on the "Morality of the Drama," and an account of the Shaksperean examination for public elementary schools, instituted by the Association last year, and to be continued annually. The play selected for examination this year was the "Tempest," and next year it will be "Julius Cæsar." The *Journal* contains the question paper on the "Tempest," and it does not strike us as very profitable.

Of late there has been a great reform in the literary text-books in use in the better class of French schools. The old-fashioned notes, in which every beauty of the poet was extolled as a marvel, are giving place to more modern ones, in which illustrative citations and quotations explain the text, and to the teacher is left the duty of dwelling on the intrinsic qualities of the style. In a series of "Classiques Français" (Paris: Delagrave; New York: F. W. Christern), M. Pellisson, a graduate of the École Normale, and now Professor of Rhetoric at Angoulême, has prepared school editions of three of Molière's plays which recall the excellent series of Shaksperian plays edited by Mr. W. J. Rolfe. The three in question are "Tartufe," the "Avare," and the "Femmes Savantes"; no doubt others will follow. To each play is prefixed a biographical and critical study of Molière and of his style, succeeded by a special explanatory essay on the play to be read. At the foot of each page are judiciously brief remarks on grammatical and lexicographical points; and longer illustrative quotations and explanations are appended. Altogether, these editions seem to us much better than any in use in American schools—for students, at least, who are sufficiently advanced in French not to need any assistance in translation; and perhaps such students only should be allowed to read Molière.

A second edition of the 'Literary Reader,' part 2, prepared for the higher classes in (Dutch) schools, and for home-teaching, by Taco H. De Beer and Elisabeth Jane Irving, marks the interest felt in the English language in Holland, especially as the work has been entirely rewritten. The selections from English nineteenth-century writers are commendable, but the critical estimates hardly deviate from the generally accepted judgments. The English are followed in the absurd estimate put upon Poe; and in the case of our other literary lights very little deference is paid to American opinion. Emerson as a poet is wholly disregarded. Walt Whitman is classed under "novelists and humorists." We fail to identify the novelist "Passmore Edwards," who is ranked, as a warm supporter of the abolition cause, with Mrs. Stowe and Richard Hildreth.

We have received from Mr. Christern the first number of the *Baltischer Föderalist*, a "political liberal monthly, free from censorship," published at Geneva. As its title indicates, it is to be devoted to the interests of the Baltic provinces, although its rather meagre contents do not make it clear how these interests are to be advanced as distinguished from "liberal" interests elsewhere in Russia. The *Föderalist* is not in sympathy with either Russia or Germany; denounces Ignatieff as well as Aksakoff and Loris-Melikoff; considers Socialism the burning question of the day, yet finds neither Russian nor "European" Socialism suited to its purposes; protests against terrorism and "systematic political assassination," while predicting in leaded type that the Czar cannot possibly escape the Nihilistic attempts on his life, etc., etc.

—In an ancient city like Boston the number of the architectural relics of the past is against the paramount fame of any one of them. Partly for this reason and partly, it is true, from civic neglect, the Old State House has been quite overshadowed by Philadelphia's Independence Hall, a much younger building, and historically a good way in the rear when one examines the beginnings of colonial independence and revolt. The present Old State House, the second structure for public purposes on the same site, was built in 1713, and, though burnt out in 1747, retained its exterior walls. The upper halls, which, with the roof and other external features of the building, have been restored with the greatest accuracy and intelligence at the cost of the city, are now as nearly as possible the same as those in which Otis denounced the Writs of Assistance in 1761, when, as John Adams, a rapt spectator, declared, "Then and there was the first scene of the first act of opposition to the arbitrary claims of Great Britain; then and there the child Independence was born." Other stirring scenes in the same halls, in which Samuel Adams particularly figured as the opponent of Parliamentary usurpation, are described in the scholarly dedicatory address of Mr. Wm. H. Whitmore, of the Common Council, just published as a city document. One of these was the trial and acquittal of Captain Preston and his soldiers for the "Boston Massacre," which had occurred under the windows of the Old State House. Here, too, General Gage was sworn in as Governor of the province in 1774, and John Hancock as first Governor of the State in 1780. From the centre window of the Representatives' Hall Washington reviewed a procession in his honor in 1789. From 1830 to 1840 the city occupied the building for its municipal offices, Harrison Gray Otis being the first mayor to take possession. Mr. Whitmore's address is replete with interest, and may be had, we understand, on application to the City Messenger, Mr. A. H. Peters, at the City Hall. It is being elaborated by the author, who more than any other citizen was the promoter of the restoration, and in time it will be printed in more elegant form, with the aid, we hope, of abundant illustrations. The beautiful halls, now dedicated for ever to the public, are already much frequented from motives of curiosity and reverence.

—Two exceptions may be taken to Mr. Higginson's article on the "Visit of the Vikings," in the current *Harper*: first, as to the credit which this writer gives to Palfrey for having exploded the theory of the Norse origin of the Old Stone Mill at Newport; and second, to his statements of the opinions of the late Professor Diman concerning the Mount Hope Bay inscription. This inscription was first engraved and published in Mr. Miller's 'Notes on the Wampanoag Indians.' As to the first exception, Mr. Palfrey is entitled to no such credit. He simply copied another's work, and he very properly says so, thus: "Many of the facts in this note are taken from a little treatise entitled 'Controversy Touching the Old Stone Mill.'" This little treatise was written by the Rev. Charles T. Brooks, of Newport, where it was published in 1851, seven years before Mr. Palfrey published his history. It contains all that Palfrey gives, but it contains a great deal more. The engraving of the Leamington Mill is in it, copied, as the author says, from a cut in the *Penny Magazine*, for November, 1836. This cut Mr. Palfrey reproduces, with such changes, he says, as a personal inspection required; notwithstanding which, a personal inspection of the two engravings will show them to be precisely similar. The case against the Old Stone Mill is closed, but Mr. Higginson could have much strengthened his paper by a reference to Mr. George C. Mason's conclusive article in the *Magazine of American History* for September, 1879.

—The second exception refers to the very serious misrepresentation of the opinions held by the late Professor Diman concerning the visit of the Northmen. Mr. Higginson says: "But the remarkable fact is that Professor Diman, in giving a memorial address at Bristol, in 1880, after a rediscovery of the rock (in Mount Hope Bay), absolutely ignored its existence, and took pains to say that if the Norsemen ever were in that bay, they left no trace behind them." Professor Diman's oration was delivered September 24, 1880. Mr. Miller's 'Wampanoags' was published November 1, 1880. Mr. Diman knew nothing of the rediscovery of the rock, previous to the publication of Mr. Miller's book, which fact of course explains why he "absolutely ignored its existence." Moreover, the bay to which Diman makes reference is not the Mount Hope Bay where this rock lies, but Narragansett Bay. Immediately on the publication of the book a copy was sent to Mr. Diman, and he wrote a communication concerning it to the *Providence Journal*. In it he used the following language:

"But the feature of this book which gives it its special interest, and which is likely to call the attention of scholars to it very widely, is its incidental reference to the Northmen, and the account it gives of the very curious inscription that has been discovered near Mount Hope. An engraving of this inscription is given in the appendix, and a cursory glance is enough to show that if its genuineness can be established beyond a doubt, it furnishes by far the most decisive evidence that has ever been brought forward of the presence of the Northmen in our bay. The letters bear a much closer resemblance to Norse writing than the inscription upon Dighton Rock, which is now considered by the most competent judges to be the work of Indians. The Mount

Hope inscription is totally different in appearance, and, if we are not wholly deceived in our estimate of its importance, it will lead to a new discussion of the vexed question of the visits of the Northmen to Narragansett Bay."

When Mr. Higginson quotes: "If the Norsemen ever were in the bay, they left no trace behind them," he adds, "This verdict ought to be final." There is another paragraph, however, in Mr. Diman's memorial address which runs as follows: "We may accept without hesitation the claim that they (the Northmen) discovered Greenland, that they cruised along the coast of Labrador and Nova Scotia, and that they pursued their dangerous navigation as far south as Cape Cod and Narragansett Bay."

—The second session of the American Forestry Congress was held in Montreal on Monday and Tuesday, the 21st and 22d instant. The attendance was not large, and only remarkable from the entire absence of all the men to whom the country looks for instruction in regard to the condition and proper management of our forests. Dr. Loring presided in his usual graceful manner. His deportment was fine, and the hall "fairly rang with applause," we are told, at some of his graceful sallies, although, fortunately for his hearers, he did not confine himself very closely to the subject of the meeting. Science, according to the head of the Department of Agriculture of the United States, can do nothing more for forestry. Science has had its say on this subject, and the solution of the forest question must now be left to some other and presumably more effectual agent—the platform, no doubt. The usual amount of startling statistics were presented to the meeting—the number of times the railway-ties in use in the United States would stretch round the earth if placed end to end, and how big a pile of cord-wood these same ties would make, and how much bigger such a pile would be than the pile of wood made every year into matches, and so on—and much vague and general talk about forests was indulged in. The occasion, however, produced a few good papers. Mr. B. E. Fernon's, upon "Conditions of Forest Growth," was suggestive, and showed practical knowledge of the subject. Dr. Mohr, of Mobile, spoke of the distribution of the hard-wood trees of the Gulf Region—a subject on which his wide travels through the Southern States in connection with the Census investigation should have made him an authority. Professor Bickmore, Curator of the American Museum of Natural History of this city, who was to have described the nature and purposes of the really magnificent collections illustrative of the forests of the United States, which New York owes to the enlightened liberality of Mr. Morris K. Jesup, withdrew his paper in order to read it before the American Association for the Advancement of Science, convened in the same city.

—It is well known that 'Faust' was originally published as a fragment in the first authorized edition of Goethe's works, 1787-90. The bookseller Himburg, of Berlin, made the first complete collection of Goethe's writings, which he issued, without the author's sanction, in a very corrupt form. Goethe complained bitterly of the piracy, as the only recompense which he received for this infringement of his rights was the present of a piece of Berlin porcelain. He was led, however, to undertake the preparation of a complete edition of his works, which was published by Goeschen in Leipzig. The seventh volume contained 'Faust: a Fragment,' which was soon issued separately. Copies of 'Faust' in this latter form have become very rare, and Hirzel procured in England the copy contained in his valuable Goethe library, now the property of the University of Leipzig. Two reprints of this early 'Faust' have recently appeared. The one (published at Freiburg im Breisgau) is an exact reprint of Hirzel's copy, line for line, even to the size of the page. The type, punctuation, and typographical errors are faithfully reproduced. The second reprint (Heilbronn) contains a valuable introduction by the editor, discussing the relative value of the various editions that appeared in 1790. Four editions of 'Faust' were issued by the same publisher in that year. The question naturally arises, Which of these is the earliest, corresponding most nearly to the form as it was originally written by Goethe? After a careful comparison of eight texts, Seuffert concludes that the poem first appeared in the seventh volume of the collected works, and was issued separately, possibly printed from the same plates, the signatures at the bottom of the page being omitted, and a new title-page prefixed. The first five sheets were found reasonably free from errors, but the remaining five contained so many misprints that the types were reset, in which operation other mistakes were introduced. These sheets, as revised, were published in a second edition of Goethe's works, which appeared the same year. 'Faust' was issued separately in Leipzig, and, which seems to have escaped the knowledge of the editor, in Vienna. Hirzel's treasured volume, as well as Holland's facsimile reprint, is a copy, not of the first, but of the corrected edition. In the Seuffert (Heilbronn) edition, obvious errors of print are corrected; these changes are, however, indicated in the preface. Marginal numbers refer to the lines of the standard editions of Schroer and Von Loeper. The Holland edition, while thus relegated to the second place in point of time, has an independent interest as preserving the original typography of the first five editions. It may be added, as an illustration of the early indifference of Goethe to the text of his own writings, that he did not retain copies of the original editions of his works; and when he set about preparing a corrected edition, he used in some cases the corrupt text given by Himburg.

—Professor Ernst Haeckel continues, in the July *Rundschau*, his interesting "Letters from India." His sojourn in Ceylon promises to be rich in scientific results, the flora of the island having especially fascinated him. He speaks of the botanical garden of Peradenia, near the ancient "royal city" of Candy, as "the botanist's paradise." This wonderful region has furnished him with subjects for numerous drawings and water-color sketches, which will undoubtedly be given to the public in the full account of his expedition. The botanical garden was laid out by the British Government in 1819, and comprises 150 acres. It subserves not only scientific, but also practical purposes, inasmuch as the planters and gardeners of the island receive from it their supply of seed. At the time of Prof. Haeckel's visit, he met there Dr. Marshall Ward, Royal Cryptogamist of Great Britain, who was sent out by his Government two years ago to study the "coffee-leaf disease," which for a number of years has made such havoc among the coffee plantations of Ceylon. Dr. Ward fully recognized and described the nature of the fungus causing the blight (*hemileja vastatrix*), but failed to discover a remedy. As a reward for his arduous labors, he was severely attacked in the press, especially by coffee-planters; "as if," Prof. Haeckel takes occasion to say, "the hundreds of scientists who are in Europe engaged in similar investigations always succeeded in finding a remedy after recognizing the disease. The experienced physician and naturalist familiar with the facts knows that this is very rarely the case, and that the wonder rather is that there exists any specific at all, such as quinine is against fever." Haeckel found botanizing in Ceylon by no means pure pleasure; for while admiring a magnificent specimen of the oil palm (*elaeis*), he suddenly felt his legs attacked by half-a-dozen leeches (*hirudo ceylanica*), one of the worst of the many zoölogical plagues which infest that island. They crawl with wonderful rapidity up one's boots, boring their way through the stockings. Their bite is not always immediately felt, so that one evening Haeckel did not notice their presence on his body until he saw the blood trickling down his white trousers. The bite is not generally serious, but may sometimes become so. Prof. Haeckel protected himself afterward against them in his excursions by impregnating his high boots at the top with carbolic acid. He, however, made a much more dangerous acquaintance in a large cobra (*naja tripudians*), which crawled through the open garden-door into his bedroom, and was within a foot of him when noticed by his servant. Altogether, his visit to Ceylon did not lack the excitement and pleasure which the mere sportsman is sure to find there. He was, for instance, so fortunate as to kill at the first shot a colossal lizard, over six feet in length, the *hydrosaurus salvator*, so much dreaded by the superstitious natives.

—In an exhaustive review of the new edition of Overbeck's 'Geschichte der griechischen Plastik' (History of Greek Sculpture), in the Augsburg *Allgemeine Zeitung*, the Egyptologist, Prof. Ebers, breaks a lance for ancient Egyptian art as the progenitor of Hellenic art. Contrary to Overbeck, he denies the autochthonic character of the earliest Grecian art, dwelling, with Pausanias and Strabo, on the resemblance between Greek and Egyptian statuary, so noticeable in the head-dress, and pointing out that even the symbolical figures, partly human, partly animal, the existence of which in Greece Overbeck denies, were occasionally imitated by the earliest Hellenic sculptors. Overbeck admits that in Grecian statues the ears were frequently placed too high—a peculiarity universally noticeable in the Egyptian heads of antiquity, and, according to Ebers, to be found in reality among modern Egyptians. Phœnician influence, he says, easily explains the imitation of Egyptian models in Hellas; for the Phœnicians had completely adopted Egyptian art, carrying the statuary manufactured on the Nile to Cyprus and other islands, as well as to the coast of Greece. It is scarcely derogatory to Grecian art, Prof. Ebers thinks, to assume that its archaic works were influenced by Egypto-Phœnician example, as we thus leave intact our conception of the Hellenic sense of beauty and truth to nature. Prof. Ebers intends to treat this subject more fully at a later day.

JOHN BRIGHT.

The Life and Speeches of the Right Hon. John Bright, M.P. By G. Barnett Smith. 2 vols. London: Hodder & Stoughton; New York: A. C. Armstrong & Son.

To a student of human nature, few pursuits are more interesting than to trace out the essential contrast underlying the superficial similarity between the character of Cobden and the character of Bright. Such a comparison is certainly (in spite of the proverb) not "odious," and affords the best means for appreciating and understanding the strong and the weak points of the Quaker statesman, who will always be an impressive figure in the historical portrait-gallery of English worthies. To superficial observation, the two heroes of the free-trade movement appear the Siamese twins of public life,

They had everything in common which it was possible for two politicians to have in common without sacrificing the peculiarities of individual character. Their objects were the same. They both made the freedom of commerce, the maintenance of peace, the development, in short, of industrial progress, the ends of their statesmanship. They both sought to attain these aims by the same means—namely, by orderly agitation, and by appeals to the English democracy. They both, though at one time the acknowledged leaders of the popular party, were never republicans or, even in the Continental sense of the term, democrats. They both sprang from and represented the English middle class; and they were both imbued with the principles, the sentiments, or the prejudices of manufacturers. Hence they were both out of sympathy as well with the nationalist as with the communistic doctrines which, for thirty years, convulsed foreign society. Identity of opinion led to identity of action. On two occasions only, during a long Parliamentary career, were Cobden and Bright found voting on opposite lobbies. While they both lived, they uniformly shared both triumph and defeat. They both rose to fame with the success of the Anti-Corn Law League; they both suffered discredit from the failure to bring over their countrymen to the doctrines of the Peace Society; they both denounced the Crimean War; they both were at once horrified and amazed at the influence of Palmerston; they both were utterly defeated in their struggle against Palmerstonian popularity. As the tide of sentiment which had brought and kept Palmerston in power began to ebb, Cobden and Bright alike regained authority. The one never took office, but he negotiated the French treaty; the other has now been three times a member of the Cabinet, and could hardly be excluded, against his own will, from any Liberal Ministry.

Perfect unity both in opinion and in action has been, moreover, in the case of Cobden and Bright, combined with loyal, complete, and unbroken friendship. When, on the death of his colleague, Mr. Bright uttered in Parliament the few words which conclude with the sentence—"I have only to say that, after twenty years of most intimate and almost brotherly friendship with him, I little knew how much I loved him until I found I had lost him"—every one knew that this language was the expression of the simplest truth. The range of political history may be searched through without revealing one other instance of friendship between political allies so tender and so unbroken as the tie which bound together the two freetraders. It is indeed possible that this closeness and permanence of union between two men, each of whom was endowed with marked individuality, was due to the contrast between their characters; for Cobden and Bright were at bottom as different as two persons can be who adopt the same principles and adhere to the same course of action. Cobden was essentially a thinker. Cobden's rapid intellectual development, the marvellous use he made of every opening for self-education, his restless curiosity, his keen observation, his belief in his theories, his devotion to them, his argumentative prowess in their defence—are the traits which arrest the attention of all thoughtful readers of the excellent biography by Mr. Morley. Cobden's conduct was throughout life governed by his intellectual conceptions. His ideas of progress forced him to labor for their realization. These conceptions became, in a true sense, his religion. Hence he was by conviction, in virtue, one may say, of the faith that was in him, a reformer or an innovator. But the method which he adopted to promote the cause which he had at heart was accidental. He was an innovator by nature; he was an agitator and a speaker by the force of circumstances. Argument was natural to him; but the fact that he argued before assemblies and harangued popular meetings was the mere result of his position. Under different circumstances he might have been an official and an administrator, and have applied his powers of persuasion to convincing monarchs or ministers instead of using them to convince meetings or associations. He was at least as much at home in the negotiation of the French treaty as in conducting the affairs of the League. He was never, in any true sense, a Liberal; he was scarcely a democrat. By nature he was an administrative reformer, connected by moral and intellectual affinities far more closely with ministers such as Turgot than with oratorical statesmen or agitators such as Grattan or O'Connell.

Cobden was, therefore, according to the point of view you take, at once a much less or a much more thoroughgoing innovator than he appeared to the public. He had no taste for disorder or violence; he had none of the revolutionary fervor for change; he had, to judge by his attitude, not only as regards the *Coup d'état*, but also as regards our Civil War, little sympathy with the desire for freedom as distinguished from the desire for rational and orderly government. On the other hand, he was utterly uninfluenced by the Conservative respect for established forms; he had not any desire to keep to the "lines of the Constitution." In plain truth, he had no respect for the Constitution itself. He avowed his preference for the administrative efficiency of the Prussian beaurocracy to the apparent inefficiency of English constitutionalism. Had he ever been in power, he would, we suspect, have been found one of the most efficient, the most daring, and the most restless of administrators. An enthusiastic theorist, endowed with gifts of practical management, will go far greater lengths in the way of change than will the most vehement of orators. Moreover, as we have said, Cobden's theories of progress were his religion. With the fervor and sincerity of his social views is, it may be suspected, closely connected his calmness or neutrality as to what are generally called religious questions. He was, to judge by Mr. Morley's account, a churchman who, like the mass of English churchmen, accept calmly the creed in which they are educated, and as regards their political and social convictions leave this creed altogether out of account. Cobden was, to judge by every sign by which one man can judge another, as good a man as has ever taken part in English public life; but his goodness had little connection with the religion which is, or is not, taught in churches.

No one fact marks so clearly the contrast between Cobden and Bright as the different relation of the two statesmen to their religious creed. Cobden's churchmanship is a matter of very secondary importance. It perhaps preserved him from a special form of sectarian narrowness; it certainly had no other effect on his public life. George Combe's 'Constitution of Man' contributed much more to his moral development than did the Prayer-Book. Bright's Quakerism, on the other hand, is the key to his character. It has colored his convictions, his oratory, his political conduct. No one will ever appreciate Mr. Bright's powers or their limitations who does not remember that the one Dissenter who has since 1662 played a leading part in English public life was by birth, by training, and by sympathy, a member of the Society of Friends. That Quakerism has given to Bright his deepest convictions is, in one sense, patent to every one. His earliest efforts as a politician were directed against the union of Church and State, against capital punishment, against just those features in English institutions which are most opposed to the Quaker theory of life. It is of much more consequence to notice that his eloquence itself derives its special peculiarities from his creed. His oratorical genius was, like every other form of genius, the gift of nature; but the specific character of his oratory has, in two or three different ways, been impressed with the Quaker spirit. Its peculiar beauty is its simplicity, its directness, its massiveness. Let a Quaker be inspired with eloquence, and that eloquence must of necessity resemble the speaking of John Bright. It is, again, to Quakerism that one may to a great extent refer a peculiarity in his speeches which has been more often noticed than understood. Bright has done more than most speakers to affect the convictions of Englishmen. But Bright—in this point utterly unlike Cobden—never argues. He is neither the sympathetic reasoner, such as Mill, who tries at any rate to enter into the position of his opponents, nor is he the cogent logical reasoner, such as Cobden, who meets opponents with an array of clear, forcible arguments, which, if you once grant their premises, constrain an almost inevitable acquiescence in their conclusions. Bright's strength lies not in argument, but in the statement and enforcement of the strong points, and especially the strong moral points, of his case. His speeches against the Crimean War produced in the long run as much effect for good or bad on public opinion as any speeches which have ever been delivered. The fruit they have borne is a good deal more visible in 1882 than it was in 1854 or 1857. These addresses owe their effectiveness not to argumentative force, but to the vividness with which they bring before popular imagination the actual and indubitable horrors of war, the apparent remoteness of the interests for the sake of which soldiers are tortured and slain on the battle-field, and the immense material losses which counterbalance the problematic gains of warfare. To the reasons for and against the war with Russia, nothing is directly added. But hundreds who had never till they had listened to Bright realized what war is, were forced while hearing him to recognize the greatness of its evils, and thus to feel that nothing but the most unanswerable reasoning could justify a civilized or Christian nation for having recourse to arms.

Exactly the same remark applies in principle to his speeches upon reform or upon Ireland. Here, again, what you find is not argument, but the forcible statement of certain facts which, as far as they go, tell in favor of the orator's conclusions. It were easy to find a hundred answers, good, bad, or indifferent, to Mr. Bright's proposals for the extension of the franchise; but no one could read the utterances of the member for Birmingham without feeling, as he had never felt it before, the anomaly of the fact that in a country boasting of its free government the vast majority of the people had no share in what is called popular representation. His numerous addresses on Irish grievances, and his proposals for the remedy of Irish grievances, were and are open to much criticism—constructive statesmanship is utterly foreign to Mr. Bright's genius; but, on the other hand, these speeches and these proposals made it absolutely impossible for any candid man to blink the facts of Irish misery and of Irish discontent. English government in Ireland has failed of the result which it is the aim of all good government to attain: it has not produced prosperity, happiness, or even peace among the Irish people. All Englishmen know that this is so; and that they acknowledge it, is owing in great part to the speeches—one had almost said the sermons—of John Bright. For the point to notice in criticising his character is that

he always has been a preacher, and a preacher of the Quaker type. The very essence of a sermon, as contrasted with an argument, is to appeal and give new strength to moral principles which every one admits—to turn truisms into truths. The essence of Quakerism is to regard the dictates of a good man's own conscience as in some sense the inspiration of the Spirit of God; and the salient feature of Bright's oratory is that he preaches—that is, appeals to prevailing moral feelings and acts, speaks and denounces—with the certainty of a man who has been accustomed to regard his convictions as dictated by the voice of Heaven.

At this point we pass from the nature of his oratory to the very fundamental characteristic of his genius. Cobden was, as we have said, at bottom a thinker. If we might be allowed a misuse of language, we should say of Bright that he was at bottom a "feeler." His convictions rest on feeling or sentiment as surely as the convictions of his friend rested on reasoning. Nor can one avoid the conclusion that Quakerism, which teaches its disciples to consider the dictates of a good man's conscience—in other words, his feelings—as in some sense inspired, must stimulate the tendency to rely on moral sentiment as a sure guide amidst the perplexities of political life. When, on his recent retirement from the Ministry, Mr. Bright explained his action by the necessity of obeying the moral law, he obviously did not perceive the indirect censure which he passed upon colleagues whom he quitted with feelings of deep regret and of undiminished esteem and affection. He did not perceive, further, either the retort to which he at once laid himself open at the mouth of Mr. Gladstone, or the assumption which he tacitly made, not only that international dealings ought to be governed by reference to the moral law (which few persons will dispute), but that the moral rules of private life made for transactions between man and man are at once applicable to dealings between nation and nation. But if Mr. Bright, versed as he is in public affairs, and accustomed to dealings with men, failed to perceive the effect of his words, or the assumptions which his position involved, the failure was assuredly due partly to his being influenced far more by feeling than by thought, and still more to the fact that his attitude was exactly in accordance with the natural and, we may say, inevitable assumptions or beliefs of a Quaker.

Let no one, however, suppose that Bright has always been at a disadvantage as compared with Cobden, owing to his reliance on moral sentiment rather than on a reasoned-out theory of politics. A man may be a thinker, and even a logical thinker, but, if his theories rest upon unsound or narrow premises, they may lead to results far less in accordance with truth than the conclusions of a friend who is guided mainly by sound moral sentiment. On one occasion, at least, Cobden and Bright were all but divided by a tacit, though perhaps not quite acknowledged, difference of political sympathies. Cobden was a very lenient judge of Secession. Bright, from first to last, denounced the republic of slave-owners in the sternest language of political and moral denunciation. In plain truth, he lent his moral support to the armies of the North. It is easy enough to point out the superficial inconsistency between his denunciations of war and his zeal on behalf of a republic engaged in suppressing rebellion by the use of gigantic armies. It is far fairer and more instructive to note that the inconsistency, if such it were, was, in truth, the result of essential moral consistency. The wars which Bright denounced seemed to him to have no moral justification. A war for freedom against slavery was a crusade which roused all his best and strongest moral feelings. No one now doubts that Bright's fervor gave him an insight into the affairs of this country which escaped the penetration of Cobden's logical intellect. The attitude of the two men toward the United States is also connected with another difference between them which it is hardly possible to leave without notice. Bright was far more of a democrat than his ally, and, odd as the combination sounds, he was, and we are convinced he is, far more of a Conservative. Bright sympathized with popular government. He has been in office, but he has never displayed any of Cobden's administrative talent. Hence he unrestrainedly admired the American democracy. Hence, too, he has never exhibited any wish for fundamental changes in the Constitution of England.

Of the influence for good and bad of Bright's democratic conservatism we may write on another occasion. In an estimate of his character, the point to note is its conservative bias. He has, for instance, distinctly repudiated all sympathy with Home Rule, on the strictly conservative ground that two representative Assemblies would be an "intolerable mischief," and that no sensible man can wish for them "who does not wish the United Kingdom to become two or more nations." He has even more distinctly declined to express so much as an opinion in favor of republicanism. As to *opinions* on the question of monarchy or republicanism, "I hope and believe it will be a long time before we are asked to give our opinion; our ancestors decided the matter a good while since, and I would suggest that you and I should leave any further decision to our posterity." The appeal to the wisdom of our ancestors is, in its way, exquisite. Cobden was no more a republican than Bright, but we doubt whether he ever thought of pausing in any reform because our "ancestors had decided the matter a good while since."

RECENT NOVELS.

The "Lady Maud": Schooner Yacht. From the Account of a Guest on Board. By W. Clark Russell. Harper's Franklin Square Library.

The Desmond Hundred. [Round-Robin Series.] Boston: James R. Osgood & Co. 1882.

A Paladin of Finance: Contemporary Manners. By Edward Jenkins, M.P. Boston: James R. Osgood & Co. 1882.

A Mere Caprice. By Mary Healy (Jeanne Mairet). Chicago: Jansen, McClurg & Co.

Anne. By Constance Fenimore Woolson. Harper & Bros.

Aschenbroedel. [No-Name Series.] Boston: Roberts Bros.

An English "Daisy Miller." By Virginia W. Johnson. Boston: Estes & Lauriat.

Yesterday: an American Novel. Henry Holt & Co.

Antinous: a Romance of Ancient Rome. By George Taylor. From the German by Mary J. Safford. New York: William S. Gottsberger.

Leone. [Round-Robin Series.] Boston: James R. Osgood & Co.

"So They Were Married." A Novel. By Walter Besant and James Rice. Illustrated. Harper's Franklin Square Library.

It is hard to say why 'The *Lady Maud*' is not as good a sea-story as the 'Wreck of the *Grosvenor*.' It has plenty of incident and excitement, and the power of marine and nautical description displayed is just as marked. It is no more overloaded with the technical lingo of the sea than the earlier story, and yet it cannot be denied that it is hardly likely to add much to the author's reputation. The explanation of the inferiority of the story probably lies in the fact that its whole structure is felt to be artificial rather than natural. There was an unconscious art about the earlier story which riveted the attention upon the ill-fated vessel from the moment she left her moorings to the rescue of the survivors of her wreck at the close, and produced the keenest kind of dramatic and human interest. Misfortune and disaster succeeded each other with startling and extraordinary rapidity, and yet it all seemed credible, because everything that occurred had a plausible connection with what had gone before, and indeed seemed to be made perfectly natural by it. There is nothing of this kind in 'The *Lady Maud*.' She was undoubtedly a very fine vessel, and it is melancholy to think that she should have gone to pieces on one of the Bahama Cays, and that the wife of the owner, Sir Mordaunt Brookes, should have lost her life on a voyage which her husband persuaded her into taking for the benefit of her health; and there is a high degree of probability in the part played by the drunken skipper Purchase in the story; and Miss Tuke is a nice girl, with no more of the flirt about her than we feel to be natural under the circumstances. But the reader does not believe in the *Lady Maud* or her passengers. He feels that they have a literary taint which makes them unreal, and that there never was any such voyage or any such wreck, and that all the incidents of it are mere clever inventions of a sailor who has determined to write a thrilling tale, no matter at what cost.

Mr. Russell's power of minute and life-like description of sea-scenes is his most marked gift, and curiously enough, notwithstanding his long experience of the sea, his photographic pictures bring out just the same points in relief which would be apt to strike most vividly the imagination of the greenest landsman. There is in 'The *Lady Maud*' a description of a tropical storm which, for vividness, cannot be surpassed in the literature of the sea:

"But our doubts were soon resolved. We had scarcely shipped our waterproof coats when some rain fell. Each drop was as big as an egg, and though the fall did not last longer than a man could count twenty, yet so great was the weight of the drops that the deck boomed to the fall. Then came a pause, with nothing breaking the silence but the gushing sounds of water sluicing out of the scupper-holes into the sea. I was in the act of addressing Sir Mordaunt when a flash of lightning of the very color of sunlight struck through the blackness; nay, had the sun himself looked out in his full glory, he could not have spread a more piercing, widespread splendor. It was like looking at the yacht and the sea in the light of full noontide. How the eye could master so many objects in that breathless gush of yellow flame I cannot tell, but I could not have seen more had five minutes been allowed me. The masts, the line of bulwarks, the group of men standing motionless near the foremast in a crouching posture, some of them with their hands to their eyes, the whole sea black as ink, leaning its sharp ebon circle against the sulphur-colored radiant heaven—all these things I saw in that one second, and then the darkness was insufferable, thick as dense folds of midnight vapor, not a stir nor moan of air in it, of an opacity that made me pant, as though the black envelopment suffocated me. The flash fell from right overhead, and it seemed that the crash must follow before the blaze went out. This expectation made the two or three seconds of silence that followed appear as long as a minute; but then came the most ear-splitting roar that had ever deafened me. A crash indeed, not a succession of peals, but one stupendous, unechoing explosion, that, smiting the oily surface of the water, boomed away in a dreadful roar, sinking and sinking its cadence until it became a soft melodious echo in the distance."

It is hard to say whether 'The Desmond Hundred' is intended as a novel of American life, or

a religious novel, or both. So far as the plot goes, it might be of almost any country; but the scene is partly laid in New England, and most of the characters are New England people, and the author, whoever she is (for it may be assumed that she is a woman), has a high estimation of New England. Still, the hero of the book is a clergyman, who renounces the woman he loves and allows his brother to marry her, and there is a great deal about religion in the course of the story. Several of the characters, again, are English, and there is something in the tone of the religion and of the love which is not American. The author is evidently very much at home in New England, and the more commonplace New England characters and dialogue in the book are very good. The story opens with the preparations for the reception in a New England village of the popular Dr. Manoah Sampson, who is bringing his wife—*née* Miss Nazareth Pitcher—home. He has been "boarding" at Deacon Flint's, and he is bringing his wife home to "board" with him. The book opens as follows:

"'Be you going to have slapjacks, Celyndy, along with your cream-toast?' asked Mrs. Wood, standing with her arms akimbo, and watching her sister-in-law, who was sifting flour upon a great table quite as white as the flour.

"Celyndy, thus addressed, turned an apologetic little smile upon her hard-visaged relative, and replied softly, 'Well, yes, I guess so, Roxy. The Doctor, he's awful fond of my slap-jacks, and it ain't no trouble to speak of. Easter 'll fry 'em.'

"'Ye—es,' replied Mrs. Wood, meditatively. 'Only, if you'll take my advice, Celyndy, you'll begin with this woman the way you mean to hold out. Ef she sees slap-jacks and toast, and white bread and brown bread, and hot nut-cakes, and four kinds of pie, and pound and loaf, besides sa'ace, and I don't know what all, the first meal, maybe she'll think it's always going to be so, and the Doctor's ten dollars a week ain't a-going to pay for all that—not to have nothing left over, that is.'"

The novel, altogether, is above the average in the drawing of character, but in plot is rather weak, and in places vague.

Mr. Jenkins has apparently drawn the plot of his novel from the history of the Union Générale of Paris. He narrates the invention, rise, progress, and collapse of a great scheme of Catholic finance. Cosmo, the chief promoter of the Crédit Catholique, is an Italian, who comes to Paris, the possessor of a grand financial conception, which is from one point of view a scheme for helping Catholic objects by means of financial combinations of Catholic capital, and, from another, a plan for making through the use of Catholic enthusiasm a fortune for himself. He explains his project in such eloquent and glowing language to Marguerite de Rocheraie, the beautiful and devoted wife of the rich Catholic Marquis de Rocheraie, that she easily falls a victim to his wiles; but his main argument with the "solid men" of the story is simple bribery and corruption. Most of the promoters have large concessions and percentages, which are, of course, kept a secret from the body of the stockholders and from all the promoters who might be inclined to look upon such machinery with distrust and aversion. The scheme is finally floated, and the shares go up at a fabulous rate. Every one becomes enormously rich on paper; a few of the more knowing ones sell out in time, and become rich in reality; and finally a grand crash comes which brings the entire house of cards down about the ears of the great body of dupes, and the few honest promoters are involved in the general ruin.

Cosmo's operations are described by Mr. Jenkins with a great deal of skill. His speech by which he gains the assistance of the Marquise is a masterpiece. In substance the argument by which he wins her over is as follows: He begins with a sketch of the position of the Catholic Church, surrounded by the forces of Antichrist, English Protestantism, Continental atheism, Republican socialism, and, in addition to all the rest, the Jews. All these forces must be met and beaten, and the hardest of all to beat are the Jews, for they embody the motive-power of the modern world—finance. Protestant forms of belief are withering away and drying up under the intense sunlight of science. The Protestant Reformation attempted to create a "rational enthusiasm," and such an enthusiasm is a contradiction in terms; consequently, Protestantism is breaking down. Atheism is an old foe of the Church; but it has been conquered before, and will be again. "Socialism, the negation of all authority, with its modified forms of limited monarchy, constitutional government, republicanism, communism, is only Protestantism carried to its logical extremes." But Judaism is something quite different from all these. It permeates everything, not as a religious force, but because, instead, it offers "not a speculative chance of good things in an unknown eternity, but the enjoyments of the present." The power of the Jews is the power of finance—the power of the purse—which means the power of government, the control of policy, the direction of armies, the influence of the press. The Jew's new promised land is the whole world; he is buying up everything—real estate, railroads, banks, mines, the newspapers, all are passing into his hands. It is the Jew who is the great enemy of the Church. He is undermining religion by appealing to the passions most in vogue—avarice, ambition, the love of pleasure, of possession, of display, of power. And now we come to the grand idea: "The Church was rich—very rich. The wealth of its foundations, of its noble and ignoble capitalists, was prodigious—incalculable; but it was disorganized, and it was not exploited. Wealth, permitted to stagnate, lost its vitality; it was not a benefit, it was a poison. The Jew never allowed money to remain in his pocket; by keeping it moving, he turned four or five per cent. into a hundred per cent. If Catholicism would hold its own in the world—nay, would grasp the power of the world—it must grasp the reins of finance; it must dislodge and conquer the Jew."

Of course, this could only be done by a company—a great combination of Catholic capital, to control the railroads, the mines, the press, the telegraph, public opinion—everything now passing into the hands of the Jews. That such arguments as these might have great influence with a good Catholic woman, when presented by a man of Cosmo's power of statement and argument, is probable enough, particularly if he is reinforced by the support and countenance of the Holy See. Cosmo not only has the Holy Father on his side, but he quietly secures a strong financial backing from a leading Jew firm, the members of which have no more objection to a financial operation in the interest of Catholicism than to any other, provided they have an opportunity to make money out of it. The main interest of the story lies in the effect which the development of the scheme has upon the fortunes of the Marquise, her husband, and a number of other characters representing various Parisian types. This is well told, except, perhaps, that there are too many financial details. How far the life is true to the life of Paris at the present day, is another matter, which, however, is of small consequence in a work of English fiction.

If 'A Mere Caprice' is not a translation, or a close following of some French original, then the writer has a power of reproducing thought and scenes from the French point of view which almost amounts to genius. The "caprice" is the whimsical fancy of a rich, heartless, and idle woman for an orphan girl. Her best motive is revenge upon her husband's relatives, so that it is only natural that upon the discovery that the girl has by her beauty unconsciously won the love of the artist who is the object of her own ardent passion, she ruthlessly turns her out of doors. The moral of the book is high and pure in intention: it is the artist who dreams of "an ideal of tender love, unlike mere fevered passion—love which dares show itself to all; a healthy, honest love, which would not fear the blessed monotony of every-day life, with its work, and rest, and low talks by the common hearth, and the patter of little feet for its home music"; but it is taught only by negatives, and the story grows more pitiful as each struggle of the poor girl is more hopeless. The plot is new enough and exciting enough to compel the reader to follow it to the end, but the book will never be opened a second time; for, well written as it is, there is nothing beyond the plot to counterbalance the painful impression of the catastrophe.

'Anne' will be pronounced a convincing proof that the author's forte is the short story, not the novel. It is, in fact, but a succession of short stories linked together by the presence of the one central figure of Anne herself, but with no logical dependence one upon the other. Change the names, and the successive stages of the wandering plot might each stand by itself. The first half-dozen chapters of the book are indeed remarkable. It was a rare opportunity to have discovered so new a field, in the little lonely military station on the far island of the North. In one sense only a colony, and yet already provided with a past in the traditions of the great fur-trading company and of the deserted mission, its little handful of strangely contrasted people afforded unique material for fiction. The comedy or the tragedy of life there must be on a narrow scale, but it suggests combinations and possibilities quite beyond the common routine of American novels. Miss Woolson has unfortunately given it to us only in a few fragmentary sketches, and carries off her heroine to the very commonplace scenes of city boarding-schools and country boarding-houses, to suffer under the tyranny, equally commonplace, of a grim maiden aunt. Even then there was a chance for fine discriminating work in showing how the world would look to the eyes of a clear-headed girl coming to it from such a simple, unconventional life, but the author only chooses to heap incident upon incident till nothing short of murder will suffice for a climax. That the book will not bear looking at as a whole is a fault not solely of American novels. Too few show careful plan from beginning to end, or in the balance of each part with all others. The admiration excited by Anne's heroic frankness in the court-room is effectually checked by her next appearance as an amateur detective following clews so obvious that no professional of reputation could have overlooked them. Or, again, on moral grounds, it is strange that an author should not see that there can be no sympathy for Helen Lorrington, in spite of her beauty and grace, after the deliberate lie by which her husband is won, and yet that sympathy should be an essential element in the judgment of the other characters.

If 'Aschenbroedel' only were what it is meant to be, it would be a great book. On the surface, it is to portray the contrasts of life in the city and in the country, but, deeper, it is to show the difference between intellectual and refined tastes as inherited traditions, and as adopted because it is "the thing." This evidently covers the whole field of modern society, but one must not only have known it, but must also be able to choose with discrimination from its infinite va-

rieties, and to describe them accurately and pointedly. In the present book the unskilled author has made a story droll from its very naïveté. The little heroine's longing for the beautiful unknown world of books and art is embodied in a wish to "have the *Nation* and the *Pop. Sci.*" (*sic*). Her mentor and guide is a lady "very distinguished and aristocratic" in appearance. "She just writes for her own amusement, and publishes to please her friends." She regards the quiet New England village as "a social grave" from which she must rescue Aschenbroedel; and, "smiling an opaque, reflective smile," she assures her: "You ought to write. It would be the greatest resource to you, and you could not fail of making a success."

'Aschenbroedel' is throughout a misnomer. There is not a single point of likeness between the stories. A much-involved love affair comes to nought, and an *ami d'enfance* arrives at the last moment; such a picture of a hero that one feels defrauded by his being kept out of the way so long. "His elegance of manner and distinction of appearance were but incidental to the power of his presence, and he suggested a reserved soul who sat within, wrapped in the garments of sober manhood, who watched and controlled all that went on about him, including his own outward manifestation." Yet this is the best the author can do to express the admiration of the heroine on the very first day of his reappearance: "Fair women turned upon him with graceful expostulation, . . . while he sat smiling upon them with a whimsical annoyance that reminded Alice of the gay *insouciance* of her game-cock at home when attacked by a flock of turkey-gobblers."

It was not wise of Miss Johnson to bring her never too careful work into such close comparison with Mr. James's skilful execution. She can put a story together very prettily, with gay bits of color and flitting shadows here and there; but this sort of thing requires a subtler weaving than hers. The solemn brevity of the dedication, "To American women," suggests that she thinks herself breaking a lance in their behalf. It would have been more to the purpose if, instead of writing what no one can call anything but an "extravaganza," she had gathered from fiction already existing the proof that Daisy Miller is one of a class universal in modern life, and not a special American type. Given high animal spirits, with quick intelligence, with the tempting opportunities of beauty and wealth, but without training and without wise control, and the result is the same, to whatever language the pretty lips frame themselves. The word *wise* is used wittingly, for not even the most formal French restraint without steady judgment to direct avails anything: it only puts off the evil hour. Daisy Millers are frequent in English fiction. Lady Eveleen de Courcy, in Miss Yonge's 'Heir of Redclyffe,' twenty-five years ago, was not the first of the line. Miss Austen's clear eye had marked her long before. Nor will Marjorie, in Mrs. Walford's 'Troublesome Daughters,' be the last. What is wanted now is some one to show us what becomes of them a little later. They will do the world little harm if, like Mr. James's heroine, they put an end to themselves by an obstinate rashness. The severe moralist will say they are to be found in the querulous invalids of middle age, or the foolish mothers of more foolish daughters; but a more hopeful critic will find not a few of them redeemed by sincere affection (it need not always be for a lover), and becoming the simply dutiful woman, whose lot is perhaps of all the happiest. Moreover, since our British cousins are proving themselves capable of taking the broadest caricature *au grand sérieux*, Miss Johnson should have taken far more pains with the side-lights of her picture: the aunt's horrified little shrugs amount to nothing. But there is no part of Mr. James's story more carefully worked out than the portrayal of the scandal and the grief the wayward girl brought to the American visitors in Rome. That is the testimony from fact, not from personal opinion, that good society in America neither encourages nor permits such conduct.

It is not easy to pass judgment upon a book like 'Yesterday,' on account of the absence from it of what religion has taught us to think the highest motives. The theory of life in it recognizes no higher responsibility than that of man to man, no punishment for sin beyond the immediate and obvious ill-consequences to the wrong-doer, and no repentance beyond the unresisting endurance of those consequences: "Who dares to break a law should have courage enough to bear the law-breaker's punishment." This would seem to be a low plane, but the book has a positive moral interest as a picture of what life may be made upon it, or more, how a life may even be redeemed; how one mistake, one great sin it may be, need not bring utter ruin, though a man had no better faith in him than this. The story leads over delicate, even dangerous ground, but throughout conduct is judged with a temperance and a justice that command respect in spite of the lower motives. The rattling pace of the opening chapters should not repel the reader, and he will find himself repaid by the picture of an actor's life from a novel point of view. Grace Delahay, the heroine, is an ennobling example of the restraining influence of a fine-souled woman even when her direct efforts are thwarted, and her only opportunity is the silent witness of steady, pure living.

Mr. Taylor's romance is another attempt to read that enigma of antiquity, the story of Antinous. His solution is stated simply enough: "How a healthy nature was ruined by companionship with a diseased one—is the history of Antinous and his Cæsar." To work out such a solution requires the insight of genius—it could be no surface-work; but we are given only a succession of incidents, loosely connected and narrated without enthusiasm. The book is purely conceived and purely written, as we commonly use the word; but the view generally taken is a degrading one. Nor is this true only of the heathen world. The early Christians are described in their dissensions, their weakness, their excesses, at wearisome length, while their faith, their devotion, is, not passed by—that would have been but a fault of omission—but somehow dishonored, belittled. It is the infelicity, the injustice, of such books that it is so much easier to describe the bad than the good. It is open to question whether the day for such attempts at reproduction is not wholly past. Time was when something of "the grand style" still lingered in fiction. The last generation had 'Aurelian' and 'Zenobia'; but in a day when a romance or a novel must be, for the general reader, all incident or nothing, the old Roman world supplies too little variety of material without drawing upon stores too unfamiliar to all but scholars, in any feeling of reality. 'Hypatia' owes its power to the glowing fervor which urges the Christian arguments against what is really modern thought, though clothed in terms of heathen philosophy; but all later attempts of the kind seem to us cold and lifeless.

'Leone' deserves a passing glance for the sake of the contrast between the style and the stuff of the tale. More commonplace and more tame description and dialogue could hardly be, but the incidents are enough for more than one melodrama. The heroine is twice taken prisoner by brigands, first in company with her father, lover, and teacher. This, however, is without the knowledge of the leader, Leone, who releases them without ransom—as being a modern knight-errant or Italian Robin Hood, who does not rob women or foreigners—and also for the quite minor reason that Sylvio, the lover, is apparently his own son. The second time, Edith is captured alone by Leone himself, to compel the consent of the father to the engagement broken off, he thinks, by him. He is morally frustrated in this plan by Edith's insisting that she alone has broken it, and actually defeated by the capture of himself and his whole band through the skill and courage of the father, Mr. Norman. Need it be said that the latter is an American? Who else could, when blindfolded, carefully mark directions by the compass on his watch-chain, count his steps and record them on his shirt-cuffs? Who else would make nothing of an attack upon the brigands who have successfully defied the papal authorities for twenty years? Leone, deserted by his secret allies, the Government officials at Rome, is fatally stabbed by one of his own men. Dying, he confesses that he is not the father of Sylvio. He only murdered the real father, the Duke of Celata, but spared the child for the sake of his eyes like his mother's, Leone's early love. Edith, who, quite willing to marry Sylvio as of unknown parents, had refused him absolutely as the son of a brigand, now consents, and the story ends with a birthday party. If our sketch is not very clear or connected, we can only say that this is more than the author has been able to make the book, though several times obliged to add the foot-note "Historical." Sylvio is a great artist, and Edith, the most wonderful and most impossible of American girls. The truth and beauty of the local color may be judged from the fact that the writer knows no difference between Campania and Campagna.

'"So They Were Married"' is a story of the kind which the experienced critic of fiction is inclined to pooh-pooh, and afterward to find that the experienced reader of fiction immensely enjoys. The materials out of which the tale is made are very slight. There is a tropical island, with sugar plantations owned by creole families, half English, half French. The English owner of one of these has a charming niece, Virginie, and a son, Tom, who loves Virginie, but never quite explains to her the nature of his affection for her. They have grown up like brother and sister, so that it is but natural that there should be some confusion in her mind on the subject. Then there is a wicked cousin who comes out from England—a cold, selfish villain, a confirmed gambler, who is devouring the paternal estates, and whose sister wishes him to make a rich marriage and save himself from absolute ruin. This he would like to do himself; but there is a serious obstacle in the way in the shape of an existing wife, an actress, who, with her child, may turn up at any moment and assert her rights. Nevertheless, Guy, after in vain endeavoring to get his wife to give her consent to his committing bigamy, resolves to run for luck and commit it without leave. The result, of course, is that Virginie discovers all after engaging herself to Guy, whom, however, she does not love. The engagement is broken off, Guy is banished from England, a ruined man, by his old father, who acknowledges the son of the actress as his heir, and Virginie goes back to the tropical island in time to save Tom's father from bankruptcy and marry Tom. This plot, or something very like it, has been used a thousand times on the stage and in novels, and the critic, consequently, is right in insisting that Messrs. Besant and Rice show no originality in it. But the charm of the story lies, as the reader finds, in the treatment—the vivacity, the descriptive power, the humor, the rapidity of movement and naturalness with which everything takes

place. Possibly Guy is overdone; probably no one was ever quite so depraved a villain as he is made out; but then with villany a little overdrawing is permissible. Everybody else is as true to life as need be, and the description of plantation life on Palmiste Island is as fresh and entertaining and out-of-the-way as the description of Australian life in 'Never Too Late to Mend' was twenty-five years ago. The story has, besides, a refreshingly masculine tone, though we should say that a woman would find it quite as agreeable reading as a man. There is little or no introspection and analysis in it. The characters are not continually studying themselves and considering how they affect each other, or fishing among their emotions for ingenious paradoxes and curious contradictions. On the contrary, the men merely want things—excitement, pleasure, love, and money—and these they try to get; and the women want the same things, and in their different way try to get them too; and in getting them each is restrained by his or her conscience, such as it is, with the exception of Guy, who has none. There is a half-French vivacity about the descriptive parts, as well as the dialogue, which carries the reader along in a very lively and inspiriting fashion; and here and there there is a suggestion of a situation of a highly dramatic kind. Indeed, the story might easily be worked up into a play, with very slight modifications. Altogether, it is difficult to imagine any sort of reader—excepting always the experienced critic—who could possibly begin '"So They Were Married"' and put it down without finishing it, and this, too, although he knows perfectly well from the beginning how the story is going to end.

The Relation of Political Economy to the Labor Question. By Carroll D. Wright, Chief of the Massachusetts Bureau of Statistics of Labor, etc., etc. Boston: A. Williams & Co. 1882.

He must be a very modest writer, in these days, who refrains from sneers and ridicule against the orthodox, or scientific, economists. Every week or two a new book appears in which some writer, who has caught up a few vague notions from the professorial socialists, makes a new attempt to talk about grave economic subjects which he cannot even state, and pads out his discourse with derision of Smith and Mill, and oracular warnings about political economy and the economists. There is a set or fashion of thought in which all writings of this class now run, and they stand for the most part on the basis of two or three pretended scientific works which have never received the criticism which they deserve. There is a pseudo-philanthropic tone, which is just now in vogue to such a degree that any one who talks common sense has little chance of a hearing.

Mr. Wright's book is such a perfect specimen of the class to which it belongs, that it might profitably be made the text of a judicious and rigorous review of the maudlin economic literature. The author starts out by finding fault with the definition of political economy. He entirely overlooks the fact that a writer on any science may define it as he chooses for his own purposes, and is open to no criticism if he remains faithful to his own definition. Mr. Wright follows Walker into some criticisms of Mill's definition of political economy, which simply evince an unaccountable misconception of Mill's statements and of his entire philosophy. Did Mill overlook the ethical side of all branches of social science? The definition of political economy for which Mr. Wright contends extends it over the whole domain of social science and social art. The writers who have adopted that definition have written great treatises running over the whole field of sociology, but presenting all the parts out of focus. The result has been anything but good.

Mr. Wright emphasizes the moral side of economic matters. The school to which he belongs has a cant of this kind. Not long ago, a prominent member of it urged that the cure of the Irish troubles must be sought in moral forces. The truth is, that economic forces are more elementary and primitive than moral forces; they act on men sooner, and at a lower stage, than moral forces. In the history of the race the economic experiences and motives came into play long before the moral injunctions, and led up to the latter. Also, men, when they degenerate, fall below the reach of the moral forces long before they fall below the economic motives. A man will act wisely through self-interest long after he has ceased to act wisely because he thinks it right. When Mr. Wright comes to the troublesome question of a standard for his ethics, he disposes of it easily by giving us the decalogue. To say nothing of any other difficulties, let us only ask what light the decalogue throws on the question which is raised about the "justice" of the distribution of wealth. The relation of political economy to morals is just parallel to that of physiology. Every science aims to instruct men in the laws of right (*i. e.*, prosperous and happy) living on earth. The man who understands the functions of the bodily organs should know how to live rightly as regards health; he who knows political economy should know how a man shares in the welfare or misery of a society as regards wealth. That political economy will conduce most to the welfare of men if it is pursued singly, simply, and directly, as a science, is beyond dispute.

Mr. Wright states the labor question thus: "How labor may be rendered more generally attractive and remunerative without impairing the efficiency of capital, so that all the workers of society may have their proper share in the distribution of profits." Put in plain language, this is the question how work may cease to be disagreeable, and how for a given effort we may get more good things to enjoy than we now get. These questions are as old as the human race. The economists who deserve the name will all admit that they have given up the first as unanswerable. The second they have always professed and aimed to treat as the real object of their science. If this question should be solved, there need be no question of guarding the efficiency of capital, for its efficiency would be increased inevitably at every step. It may be added, as a useful practical rule for the tyros who insist upon trying their hands on economic questions, that it is a sure mark of an incorrect solution of an economic problem that said solution is attended by the necessity of an artificial provision for the security of capital. When the correct solution is found, the parts all fit together and support each other without forcing or artificial support.

Of course *laissez-faire* comes in for a blow from Mr. Wright. He understands that *laissez-faire* is what used to be called Fate. *Laissez-faire* is nothing but liberty, and liberty is the prime moral principle in the civilization of to-day. When the merchants said to Colbert, "Laissez-nous faire," they were simply stammering out the first feeble expression of the new spirit which was to be the life of the centuries between their time and ours. The doctrine has been misunderstood, sneered at, rejected, and even abandoned by those who ought to have defended it; but there it is yet, the highest social and moral principle which civilization has yet attained. Any so-called moral doctrine which is not based on liberty turns out, upon analysis, to mean simply that, if A errs and suffers, B is responsible, and not A. Mr. Wright declares that "mildew will strike the political economy which denies the validity of the distinction" between the exchange of commodities and the contract for services; and he quotes from Walker an expression of astonishment that economists should put these two things on the same plane. Seventy-five years ago, he says, there were laws regulating the exchange of commodities, but none regulating contracts of labor. But the economists have been urging liberty in *all* contracts. They have striven to abolish the regulations of trade, and they have resisted the regulation of labor-contracts, having in view all the time liberty of contract between adult men as the only proper principle in a free, self-governing state. The question whether the exchange of commodities differs from the sale of labor is a silly and barren controversy of the German economists.

It is, perhaps, unfair to take up a little book like the one before us and make it bear the criticism which is due to the school of whose products it is a very modest specimen. It is high time, however, that there was some very thorough and pitiless criticism of the twaddle which is put afloat about "labor." In this country we all labor. If it is a free country, the first thing to which every free man needs to make up his mind is, that he has got to take care of himself. If he is sober, industrious, and economical, he will acquire capital. He will then rise out of the class technically called "laborers" by those who write essays on "the labor question." The economic philosophy which Mr. Wright teaches will then impose upon him the duty and responsibility of taking care of those who have not issued from the laboring class; and he will, at the same time, hear the "laboring masses" extolled as the wisdom, strength, and glory of the country, and the "capitalists" blamed for everything which goes wrong. We cordially agree that there is in all this a great muddle; but whether those whose heads and hearts are sound enough to resist gush and false reasoning are the ones to blame, is open to question.

Gray. By Edmund W. Gosse. [English Men of Letters.] Harper & Bros. 1882.

In one respect this volume differs from all its predecessors. In all the other biographies of this series the chief task of the writer has been to condense and compress, and to distil the essence of perhaps two stout quartos into a thin duodecimo, occasionally to the irritation of one reader or another, who doubts if it be the proper function of literature to fill up the odd half-hours of the busy, or to enable the idle to avoid, with the least possible trouble, the appearance of ignorance. Here, however, it is the other way. Previous biographies of Gray have been so meagre that Mr. Gosse has been compelled to seek all procurable material, in manuscript as well as print, and the volume before us has the advantage of being the fullest life of the poet yet given to the public.

That the material for biography is small is not to be wondered at. Few lives of eminent men have been marked by less of incident. Studious, shy, refined to fastidiousness, physically indolent, Gray was in some respects a typical man of letters, pure and simple. There have been writers of the first rank who found in literature the only expression of energies that, under other circumstances, would have made them revolutionists, martyrs, or heresiarchs. With Gray, the perfect expression of delicate, tender, and serious thought fully satisfied all the requirements of his nature. If he treats a tragic or passionate theme, it is as an artist, not as an enthusiast. The artist-nature was predominant in him, and

we note very interesting traits of it in the simple but vivid sketches of natural scenery, especially of the wilder kind, in his letters, which quite anticipate the nineteenth-century feeling, and might not inappropriately be placed beside Mr. Ruskin's glowing periods about the mountain glory and the mountain gloom.

Mr. Gosse looks upon Gray as a mighty spirit whose powers were frustrated by "lifelong exile in the wondrous eighteenth century"; but his own biography seems to give full endorsement to the general judgment:

"Far from the madding crowd's ignoble strife,
He kept the noiseless tenor of his way."

The surging and clashing masses of humanity, even then heaving with a coming earthquake, were a madding crowd, and their strivings and struggles an *ignoble* strife. He drew his pure and beautiful robe about him and slipped through the throng. At Cambridge he wrote charming Latin verse, and kept to the society of two or three congenial spirits; in his three-years' tour on the Continent, in the company of his lifelong and generous friend, Horace Walpole, most dainty of dilettanti, he frequented the best society, and saw the picturesque in its approved examples; and on his return he sought refuge from the bustle of life in the quiet cloisters of Cambridge. His work alone is what the world cares for; and his work is known to all. Here his success has been, of its kind, preëminent. He has given to our literature at least one poem which, perhaps more absolutely than any other in our tongue, may be called a classic, which everybody knows and everybody loves, and which all critics agree in praising, from Dr. Johnson at one extremity to Mr. Swinburne at the other.

An interesting feature in this sketch is the account of Gray's relations with a young Swiss named Bonstetten, of distinguished family, sent to England to finish his education. His affectionate attachment to Gray was remarkable, and was returned, with sincerity, if with less effusion, by the elderly poet, who was a little surprised by the "ardor and vitality" of the youth. "Our breed," he says in one of his letters, "is not made on this model. . . . I have never met with so extraordinary a person. God bless him! I am unable to talk to you about anything else." He kept up a correspondence with Bonstetten until his death, which, indeed, happened in less than two years from their first acquaintance.

We note a single slight, but unlucky, misprint in this edition. In the extract on page 132 we have

"Her lion-foot, her awe-commanding face."

Now, though Queen Elizabeth certainly did let those about her feel her claws pretty frequently, this particular leonine characteristic of hers was not in Gray's mind, who wrote "her lion-port."

History of the Campaign for the Conquest of Canada in 1776, from the Death of Montgomery to the Retreat of the British Army under Sir Guy Carleton. By Charles Henry Jones. Philadelphia: Porter & Coates. 1882. 8vo, pp. xiv.-234.

How a "Campaign for the Conquest of Canada" became a campaign for the defence of New York, and how the disastrous failure of the first was retrieved by the ultimate success of the merely defensive operations which followed it—this is certainly a story worth telling, and worth reading. The movement against Canada, indeed, was captivating by its audacity, and by the romantic picturesqueness of its leaders and of its exploits; but that is not the subject of this book. With a resolute self-command which is itself deserving of praise, Mr. Jones has carefully excluded from the scope of his work the splendid dash on Quebec by Arnold and Montgomery, and has written a sad story of retreat, suffering, pestilence, disorganization; the destruction of a naval force most laboriously created on Lake Champlain; and, at last, the effectual occupation and strengthening of the abandoned French lines at Ticonderoga, which the British army drew up before, and turned back from to Canada without firing a shot.

Such a narrative may be instructive, but, unless aided by literary skill or by an exceptional faculty for graphic description, it is not likely to be fascinating. Mr. Jones's book is a useful record of some of the most painful and least glorious events of the Revolutionary War. It is better worth reading than the bragging rhetoric which, masquerading in the guise of history, has been too apt to falsify or to ignore the less creditable aspects of that struggle; but his unattractive theme is not illuminated by any exceptional brilliancy of treatment. He tells, indeed, of little more than the retreat out of Canada of that army which John Adams described, in words which this author might have quoted to advantage, as "disgraced, defeated, discontented, dispirited, diseased, undisciplined, eaten up with vermin, no clothes, beds, blankets, or medicines, and no victuals but salt-pork and flour." But even this story might have been told either with graphic vivacity, or with critical acuteness, or with philosophical insight, or, at least, with laborious research. None of these qualities are displayed in the work before us. What authorities the writer used there is no indication from the first page to the last. A monograph of this sort should bristle all over with citations, so that for all subsequent inquirers it should be next to superfluous to search the original sources of history. The present volume has not one. There is, indeed, even for the cursory reader, an annoying absence of references to authorities. There are numerous quotations from letters, which in some cases might be verified or completed by a diligent student; as, where one is introduced by "wrote Schuyler to Washington," or another, "wrote General Carleton to Lord George Germain" (*sic*). But where a writer of a grave history gives such authorities as these: "wrote a British officer who was in Quebec at the time" (p. 43); "wrote one of the field-officers to Gates" (p. 121); "a New England brigadier-general says" (p. 122); "according to a British historian" (p. 163); "writes a distinguished historian" (p. 191); "an eminent writer has said" (p. 196); "writes another" (*ibid*)—it is not captious in the reader to demand the privilege of cross-examining the witness whose testimony is thus adduced.

A graver blemish upon the work, however, arises from the fact that it is frankly, as its preface announces, a *Tendenzschrift*, for the special glorification of the Pennsylvania contingent in these operations. This purpose has seemed to the author to be most readily subserved—in narrating a campaign of which the only actively brilliant exploit was the naval fight, under Arnold, by vessels almost exclusively officered and manned from New England—by frequent comparisons between the Eastern and Southern troops, to the great disadvantage of the former. Perhaps nowhere in the volume would foot-notes referring to the *pièces justificatives* be more useful than upon such passages as these: "The Pennsylvanians were in all respects better soldiers and better men"; "the Eastern regiments included within their ranks negroes and Indians" (p. 121). Perhaps, however, it is enough to give the closing paragraph of chapter xi.: "Great attention was paid to the cleanly appearance of the Pennsylvania troops. Soap was provided in abundance, and the men were required to appear upon parade with 'their hair well powdered and neatly tied and plaited.'"

The mechanical execution of the volume leaves little to be desired. Whatever differences may even now exist in regard to the superiority of Pennsylvania troops, there cannot be two opinions concerning the beauty of the page which has come to be recognizable as proceeding from the best Philadelphia presses; and this volume is, in paper, type, and presswork, one of the handsomest of its class. The proof-reading is not always what it should be, and the eight portraits which are meant to embellish it might well have been exchanged for one or two authentic maps and diagrams; but the writer's effort is worthy of commendation, and his performance is not without utility.

Thaddeus Stevens: Commoner. By E. B. Callender. Boston: A. Williams & Co. 1882.

THE absurd title of "commoner" was, if our memory serves us, first applied to the late Thaddeus Stevens during the impeachment agitation in 1867. There can be little doubt that, overlooking the absence of any nobility in this country, his admirers saw in the contest between Congress and President Johnson an analogy to English conflicts of King and Commons, and in Stevens, the leader of the House, a "commoner" *par excellence*. This poetic distortion of a term having a very precise and narrow meaning in part explains Mr. Callender's idea in reviving the title, but only in part. On pages 137, 148 a commoner is evidently one who opposes and impeaches a President; but on p. 101 he appears to be one who has a President (Buchanan) for a constituent; on p. 111, one who does not stick to Constitutional technicalities, and so on. But the most elaborate definition occurs on p. 12, and runs as follows:

"So Thaddeus Stevens was born to poverty, enslaved by physical deformity, acquainted with the ills of others. With such surroundings in his youth, it was natural that he should follow straight the road which led therefrom; to toil for those who could not work; to speak for those whose lips were dumb; to lift the trodden-down, and make the cause of the oppressed his own. And hence a commoner."

But Mr. Stevens, we learn from the preface, was also "the first Stalwart"; and the book is avowedly written in glorification of the counterfeit party policy now bearing that name, as well as of that tenacious support of the Northern purpose in the Civil War and in reconstruction which is Mr. Stevens's real distinction. There was "nothing weak or literary" about him, we are told once and again (pp. 32, 110), and a complete biography of him would be premature "in an age like the present—so full of political curiosity and so wanting in political talent," "when civil-service pamphleteers and public penurists thrive," "when political impotency is confounded with political chastity," and the nation has begun to follow "the strange gods of political æstheticism and imbecility." So Mr. Callender, whose rhetorical training has evidently not been neglected, invites the reader to "ponder for a moment over the record of one who was a man, a hero, and [though a commoner] a king." He maintains that Stevens did more than any other man "to destroy human slavery and pronounce human equality on this Western Continent." But, though his hero was born in 1792, the anti-slavery struggle on the basis of immediate emancipation and complete political equality had been waged by the abolitionists for twenty years before Mr. Stevens, in 1850, made his first speech on slavery (as here recorded), and then he did not go a step beyond the Free-Soil party in opposing the extension of slavery to the Territories, while respecting the pro-slavery compromises of the

Constitution. He was certainly "ahead of his party" when, in December, 1861, he introduced a bill to free the slaves, but not of "his *time*," as our author adds, for the abolitionists were a part of the "time," and were ready for such a measure as soon as the shot fired at Sumter dissolved the old Union.

We have, however, no desire to belittle Mr. Stevens's services to the cause of freedom. He was, with Lincoln and Stanton, the third great figure in the Northern group of giants contending with the Slave Power in arms. Perhaps the historian will find the part he played in reconstruction necessary to the solution of that tremendous problem, though some of the measures proposed by him, like the Confiscation Bill of March, 1867, to which Mr. Callender makes no allusion, were wildly impracticable and had no sequel. Our author is discreetly silent, too, about Mr. Stevens's Quixotic encounter with the Wall Street gold premium, and about the fact of his advocating the payment of the national debt in greenbacks, in the very last year of the old man's life. Why could he not let us also forget that Mr. Stevens, though of a kindly nature, could be coarse and abusive in debate, and suppress (p. 160) the speech on "swinging round the circle," with its heartless reference to Mr. Seward's injuries from the hands of the would-be assassin?

Two passages from this work seem worth quoting; the first from the useful appendix on the making of the Missouri Compromise. William Pinkney, of Maryland, was contrasting the reception of free Maine and slave-ridden Missouri, and probably surprised none of his auditors by the figure employed in the following sentence (p. 183):

> "The more infantine and feeble Missouri is to be repelled with harshness, and forbidden to come at all, unless with the iron collar of servitude about her neck, instead of the civic crown of republican freedom upon her brows, and is to be doomed forever to leading-strings, unless she will exchange those leading-strings for shackles."

The sentiments we now proceed to cite are Mr. Stevens's, and we commend them to all the Stalwart portion of the majority which voted for the Anti-Chinese Bill (pp. 132–133):

> "Our fathers repudiated the whole doctrine of the legal superiority of families or races, and proclaimed the equality of men before the law. . . .
>
> "This is not 'a white man's government' in the exclusive sense in which it is used. To say so is political blasphemy, for it violates the fundamental principles of our gospel of liberty. This is man's government; the government of all men alike. Not that all men will have equal power and sway within it: accidental circumstances, natural and acquired endowment and ability, will vary their fortunes. But equal right to all the privileges of the government is innate in every immortal being, no matter what the shape or color of the tabernacle which it inhabits."

It remains to add that this book is handsomely printed, and contains a very characteristic portrait of Thaddeus Stevens.

Scribner's Geographical Reader and Primer. Charles Scribner's Sons. 1882.

A Geographical Reader. Compiled and arranged by James Johonnot. D. Appleton & Co. 1882.

THE first of these books is based on Guyot's 'Introduction,' and is, in fact, a rewriting of it in "familiar and colloquial style." It is a good method of teaching geography, the physical portion being uninterrupted by exercises, reviews, map-lessons, or any sign of task-work, all of which are relegated to the second or political part. The latter is at once both the driest and the meagrest—for instance, there is no allusion to the existence of the colored population of the South, let alone the revolution in its labor system. The style of the narrative for primary reading is unobjectionable; the arrangement systematic; the matter open to criticism on the score of proportion; the illustrations generally of good quality. It seems whimsical, however, to figure for the races of men a white man only, and of more than doubtful propriety to label this rather insignificant, as well as commonplace, physiognomy "one of the ruling race"—as if the Reader were designed for negroes or Chinamen.

Mr. Johonnot's conception is more original, and addresses itself to a more mature age than its companion-work. He has observed that "the ability to read may be acquired incidentally while the attention is primarily directed to some subject of thought"; and in the choice of reading-exercises he regards it of prime moment that "the modes of expression be such as will constitute appropriate models of style, and will awake sensibilities in the direction of literary excellence." This last sentence is not to be commended itself for literary excellence, but the author's meaning is clear, and the principle a sound one, flagrantly violated as it constantly is in the "readers" with which the market is flooded. Its application by Mr. Johonnot is not what might have been expected. There are nineteen divisions besides one called miscellaneous, beginning with "Mountains and Glaciers," "Basins and Plains," "Earthquakes and Volcanoes," and embracing "Wild Animals," "National Characteristics," "Ruins of Ancient Cities," "Remarkable Modern [and Ancient] Works," among other topics. The descriptions are borrowed from all sorts of sources, with a taste and range more natural to the preceding than to the present generation, and with a want of critical discrimination which makes the promised "models of style" a strange medley. Magazine hack writers, newspaper reporters and correspondents, anonymous reviewers, are mingled with a certain number of great lights in literature and science. The most striking omission is perhaps that of so eminent a traveller as Darwin, who contributes nothing even under the head of earthquakes, of which he has given unrivalled accounts, or of islands, whether we think of the Society or of the Keeling Islands, or of the Galapagos. It is hardly credible that the only citations under the latter head are from J. Ross Browne. Among the sins of admission, most remarkable is a selection from a popular American writer on science concerning the atmosphere, in which occurs this rhetorical exercise: "There is an awful life-import in these never-ceasing rhythmic movements of inspiration and expiration, this tidal flux and reflux of the gaseous ocean through animal mechanisms."

We are by no means certain that the logical arrangement is best for a work of this character, whose main object is to interest from the beginning. The opening selections about glaciers are hard and technical. "An Earthquake in the East Indies" is inserted under Miscellaneous instead of under its appropriate heading. On page 91 "Geneva" stands for Genoa—a startling error when describing the termini of the Riviera. If the *date* of the selections had been appended, the youthful reader would, on the one hand, have been guarded against misconceptions of the present state of some countries and peoples, and on the other would have been able usefully to compare the past and the present, as in the case of the Ohio tornado so graphically described by Audubon (p. 71).

Episodes in the Lives of Men, Women, and Lovers. By Edith Simcox. First American from the last London Edition. Boston: J. R. Osgood & Co. 1882.

THIS is a collection of short stories and essays written in a pleasing style, and with some imaginative and analytical as well as descriptive power. Those who do not care much about the analysis of the passion of love will not find the volume very interesting; but the indifferent on this subject are few in number, and consequently the volume ought to be pretty sure of a good audience. The author is at her best in "A Diptych," a rather curiously imagined story of a young agnostic, whose first love throws him over because he does not believe in the Bible, and when he has a second opportunity of a sort that few men would be apt to neglect, and is invited to make sure of his happiness, he goes away because he distrusts himself. In this story the women are well described, but the man is shadowy and vague. "The Shadow of Death" is a rather powerful soliloquy by a widow, who analyzes her grief for the loss of her husband in an almost too acutely real way. In some of the stories the author assumes the character of a man and writes in the first person; but the man has a very feminine nature. He is much given to analysis and introspection of an unmasculine sort—that is, if the sexes can be clearly discriminated in this matter any longer. Occasionally, it seems—and in reading this little volume we are forcibly struck with the fact—as if the business of the nineteenth century was, in matters of love as in all other matters, to bring about intersexual equality as far as possible. Declarations of love by women in modern novels are very common, and there is a general independence of all traditions on the subject which, accompanied and reinforced by a wide and searching analysis, makes the whole matter much less simple than it was in the days of romantic writing. However, our author is much more learned in it than we can pretend to be, and we recommend the reader, if he be a man and wishes to become quite confused in regard to it, to read 'Episodes.'

Le Salon de Madame Necker, d'après des documents tirés des archives de Coppet. Par le Vicomte d'Haussonville. Paris: Calmann Lévy. 1882. 2 vols., pp. 360 and 363.

IN 'The Salon of Madame Necker,' by her great-grandson, we have an admirable sketch of an admirable woman, with a brilliant picture of the leading men and women of the epoch in which she was a social, literary, and almost a political leader—the eve of the French Revolution. That part of the close of the eighteenth century has been described over and over again, and Tocqueville and Taine have made it the subject of elaborate histories, but M. d'Haussonville has thrown new light on it, by drawing largely and with the skill of a practised hand from the wealth of original material, letters and journals, hitherto unpublished, and indeed practically unknown, gathered together at Coppet. This charming home, on the borders of the Lake of Geneva, naturally became very dear to the Neckers and their daughter, Madame de Staël, and it still remains the property of their descendants and the gathering place of the family. The Neckers were in their day very great persons indeed, and it was partly political and personal hostility, and partly the greater fame of their daughter, Madame de Staël, that overshadowed their real merit. It is now clear, from M. d'Haussonville's story, that their personal virtues deserved the rehabilitation which they find in his volumes, while their political failures find their excuse in the limitations of human prescience.

Unlike most French biographies, in this instance the story of husband and wife is so closely united that telling one carries with it much that reveals the nature of both. Swiss Protestants,

their domestic fidelity was of itself the best answer to those who urged them to exchange their religion and their nationality, both matters of reproach from the court party. Madame Necker was the daughter of a Swiss Protestant clergyman in a parish near Lausanne, and her excellent education and sound training stood her in good stead in her later career, so far beyond anything that could have been anticipated even in her own most sanguine ambition. Left an orphan, she eked out existence and supported her mother by teaching, and by the still harder work of companionship to a great lady, under whose roof she became the wife of Necker, a prosperous and substantial banker in Paris. Her name is perpetuated in Gibbon's 'Memoir' as that of his early love, but the story as it is told in his letters and in hers, shows that he behaved with just that timid selfishness which characterized his whole personal history. As a girl, she was bright and clever enough to be chosen to play at Voltaire's theatre, and in maturer years she played for Madame Houdetot, the friend of Rousseau. Beginning domestic life in what was even then an unfashionable quarter of Paris, in rooms over the bank, the Neckers soon gathered around them all that was best and brightest in French letters. The philosophers and encyclopædists were soon followed by the noblemen and great ladies of the court, and the leading men and women of that day of bright hopes and charming anticipations joined to make Madame Necker's salon one of the most attractive of the gay capital. It was there that the members of the Academy were really chosen, and, by a striking instance of hereditary cleverness, it was in the salons of the three generations of her descendants—her daughter, Madame de Staël, her granddaughter, the Duchesse de Broglie, and her great-granddaughter, the late Comtesse d'Haussonville, that, down almost to our own time, the immortal Forty were canvassed and discussed, and the fate of new candidates settled, long before the vote was taken. Readers of the charming letters of Doudan, the secretary of the Duc de Broglie, will see how gifted were the women of the family founded by Madame Necker, with no patent other than that of great intellectual power.

Madame Necker was a woman of force and character enough to have made her mark in any era. She was the author of five published volumes that still deserve to be read as evidences of her earnest purpose to benefit her fellow-creatures. She was foremost in securing the good management of hospitals and prisons by introducing sisters of charity as attendants. Protestant herself, she was the almoner for many Roman Catholic prelates, and in turn through their various orders distributed her own and her husband's charities. When he became Minister of State, she was his useful ally and able social representative, and, in the midst of a loose order of things matrimonial, they remained types of domestic virtue and happiness, enjoying the intimate confidence of the King and the best of the aristocracy. In her salon were found most of the French soldiers who had served in our own Revolutionary War, and through them America became a topic of frequent discussions. But when evil days fell on France—when the two honest men, the King and Necker, as the former described himself and his Secretary of the Treasury, were no longer able to hold their own against the clamor of the mob and the intrigues of the court—the Neckers withdrew to Coppet. The history of the château itself is given by M. d'Haussonville in brief but clear statements drawn from its own archives and records.

There is something tragic in the sombre close of Madame Necker's life, whose gloom was heightened by her disappointment over her husband's reformatory endeavors, as well as by her involuntary depression at the overthrow of her own reputation by the brilliancy of her daughter. As it was, Madame de Staël was but partially the creation of a mother's care, for, luckily perhaps, the fear of ill results to her health by intellectual over-training took her largely out of her mother's hands, and secured her physical as well as mental freedom and the companionship of her father. Still, as a woman worthy to be the wife of Necker, a real patriot, an honest financier, a pure man, in times when qualities such as his were more talked about than practised, and as the mother who trained her daughter, Madame de Staël, to be one of the great intellectual powers of the early part of this century, Madame Necker well deserved to be rescued from the oblivion into which her name and memory were fast passing. Her salon was transmitted through three generations down to our own day; but now times and men and women have so changed that it is unlikely that, even in Paris, any one can hope to reëstablish successfully such a high change of lofty thoughts and aspirations and real conversation. What it was that made it the typical home of the best representatives of French culture and *esprit* is admirably shown in M. d'Haussonville's sketch.
